*Acute bronchitis* generally arises as the result of exposure to cold, particularly if accompanied with damp, or of sudden change from a heated to a cool atmosphere. The symptoms vary according to the severity of the attack, *i.e.*, according to the extent to which the inflammatory action spreads in the bronchial tubes. The disease usually manifests itself at first as a common cold with feverishness and general constitutional disturbance. A short, painful, dry cough, rapid and wheezing respiration, a feeling of rawness and pain in the throat and behind the breast bone, and of oppression or tightness throughout the chest, mark the early stages of the disease. If the smaller bronchi are involved extensively, dyspnoea is severe.

After a few days expectoration accompanies the cough, at first scanty and viscid or frothy, but soon becoming copious and mucopurulent. In general, after free expectoration has been established the more urgent and painful symptoms abate; and though the cough may persist for three or four weeks, the patient is ultimately restored to health.

The case is very different when the inflammation spreads into, or primarily affects, the minute ramifications of the bronchial tubes in immediate relation to the air-cells of the lungs, giving rise to *capillary bronchitis* or *broncho-pneumonia* (*see* RESPIRATORY SYSTEM and PNEUMONIA). When this takes place the symptoms already detailed are greatly intensified, and the patient's life is in danger. The feverishness and restlessness increase, the cough becomes incessant, the respiration extremely rapid and

laboured, the nostrils dilating with each effort, and evidence of impending suffocation appears. The surface of the body is pale or dusky, the lips are livid, while breathing becomes increasingly difficult, and is attended with suffocative paroxysms which render the recumbent posture impossible. Unless speedy relief is obtained somnolence and delirium set in and death ensues.

Acute bronchitis must at all times be looked upon as a serious ailment. It is pre-eminently dangerous at the extremes of life, and it is one of the most fatal diseases of those periods.

Bronchitis is often very severe in alcoholic persons, in those who suffer from any disease affecting directly or indirectly the respiratory functions, such as consumption or heart disease, and in children who are or have been suffering from measles and whooping-cough.

One source of danger in bronchitis is collapse of the lung. Occasionally a branch of a bronchial tube becomes plugged with secretion, and the area of the lung to which this branch conducts ceases to be inflated on inspiration. The small quantity of air imprisoned in the portion of lung gradually is absorbed, but no fresh air enters, and the part collapses and becomes solid. Increased difficulty of breathing is the result, and where a large portion of lung is affected by the plugging of a large bronchus, a fatal result may rapidly follow, especially in children.

**Treatment.**—In mild cases warmth, light diet and diluent drinks alone are necessary. In severer cases expectorants, perhaps with the addition of a little opiate if pain be severe, may be required. In children, however, opium must be given with the greatest caution because of their extreme sensitiveness to this drug. Not a few "soothing mixtures" contain opium in quantity sufficient to be dangerous when administered to children. In addition fomentations and inhalations are often of use.

When the bronchitis is of the capillary form, the great object is to maintain the patient's strength, and secure expulsion of the morbid secretion from the fine bronchi. In addition to other remedies stimulants are called for from the first, and should the cough be ineffectual in relieving the bronchial tubes, the administration of an emetic dose of sulphate of zinc may produce a good effect. It may be necessary to administer oxygen.

During the whole course of any attack of bronchitis attention must be paid to nourishment of the patient; and during the subsequent convalescence, particularly in elderly persons, tonics and stimulants may have to be prescribed.

*Chronic bronchitis* may arise as the result of repeated attacks of the acute form, or it may exist altogether independently. It occurs more frequently among persons advanced in life than among the young, although no age is exempt from it. The usual history of this form of bronchitis is that of a cough recurring during the colder seasons of the year, and in its earlier stages, departing entirely in summer, so that it is frequently called "winter cough." In many persons subject to it, however, attacks are apt to be excited at any time by very slight causes, such as changes in the weather; and in advanced cases of the disease the cough is seldom altogether absent. The symptoms and auscultatory signs of chronic bronchitis are on the whole similar to those pertaining to the acute form, except that the febrile disturbance and pain are much less marked. The cough is usually more troublesome in the morning than during the day. There is free and copious expectoration, and occasionally this is so abundant as to constitute *bronchorrhoea*.

Chronic bronchitis leads to alterations of structure in the affected bronchial tubes, their mucous membrane becoming thickened or even ulcerated, while occasionally permanent dilatation of the bronchi takes place, often accompanied with profuse foetid expectoration. In long-standing cases the nutrition of the lungs becomes impaired, and dilatation of the air-tubes (*emphysema*) and other complications result, giving rise to breathlessness.

Chronic bronchitis may arise secondarily to some other ailment, especially Bright's disease and heart disease. The influence of occupation is seen in the frequency in which persons following certain employments suffer from chronic bronchitis. The inhalation of vegetable dust is very liable to produce bronchitis through the irritation produced by the dust particles and the

growth of organisms carried in with the dust. Consequently, millers and grain-shovellers are especially liable to it, while next in order come weavers and workers in cotton factories.

The treatment to be adopted in chronic bronchitis depends upon the severity of the case, the age of the patient and the presence or absence of complications. Tonics with cod-liver oil will be found advantageous. In those aggravated forms where the slightest exposure to cold air brings on fresh attacks, confinement to a warm room or removal to a more genial climate during the winter months is indicated.

**BRONCHOTOMY**, a medical term used for a surgical incision into the throat; now superseded by the terms laryngotomy, thyrotomy and tracheotomy, which indicate more accurately the place of incision.

**BRONCO**, usually incorrectly spelt **BRONCHO** (Spanish for rough), an untamed horse, especially in the United States, a mustang.

**BRONGNIART, ADOLPHE THÉODORE** (1801-1876), French botanist, son of the geologist Alexandre Brongniart, was born in Paris. In 1831 he became assistant to R. L. Desfontaines at the Musée d'Histoire Naturelle, and two years later succeeded him as professor, a position he continued to hold until his death.

Brongniart's paper on the classification and distribution of fossil plants (1822) was followed by others bearing chiefly upon the relation between extinct and existing forms. His important "Prodrome" (contributed to the *Grand Dictionnaire d'Hist. Nat.*, 1828, t.lvii.) brought order into chaos by a classification in which the fossil plants were arranged, with remarkably correct insight, along with their nearest living allies, and which forms the basis of all subsequent progress in this direction. It is of especial botanical interest, because, in accordance with Robert Brown's discoveries, the Cycadeae and Coniferae were placed in the new group *Phanérogames gymnospermes*. In this book attention was also directed to the succession of forms in the various geological periods. His great *Histoire des végétaux fossiles*, which itself was not destined to be more than a colossal fragment, was published in successive parts from 1828 to 1837. His other important palaeontological contributions are his observations on the structure of *Sigillaria* (*Arch. Mus. Hist. Nat.* i., 1839) and his researches on fossil seeds, of which a full account was published posthumously in 1880.

His memoir "Sur la génération et le développement de l'embryon des Phanérogames" (*Ann. Sci. Nat.* xii., 1827) is interesting as containing the first valuable account of the development of the pollen; as also a description of the structure of the pollen-grain, the confirmation of G. B. Amici's (1823) discovery of the pollen-tube, the confirmation of R. Brown's views as to the structure of the unimpregnated ovule (with the introduction of the term "sac embryonnaire"). It shows how nearly Brongniart anticipated Amici's subsequent (1846) discovery of the entrance of the pollen-tube into the micropyle, fertilizing the female cell.

His systematic work is represented by a large number of papers and monographs, many of which relate to the flora of New Caledonia; and by his *Énumération des genres de plantes cultivées au Musée d'Histoire Naturelle de Paris* (1843), which is a landmark in the history of classification in that it forms the starting-point of the system, modified successively by A. Braun, A. W. Eichler and A. Engler, which is now adopted in Germany. With J. V. Audouin and J. B. A. Dumas, his future brothers-in-law, he established the *Annales des Sciences Naturelles* in 1824; he also founded the Société Botanique de France in 1854, and was its first president.

For accounts of his life and work see *Bull. de la Soc. Géol. de France* (1876), and *La Nature* (1876); the *Bulletin de la Soc. Bot. de France* for 1876, vol. xxiii., contains a list of his works.

**BRONGNIART, ALEXANDRE** (1770-1847), French mineralogist and geologist, son of the eminent architect who designed the Bourse and other public buildings of Paris, was born in that city, and became professor of natural history in the Collège des Quatre Nations. In 1800 he was made director of the Sèvres porcelain factory, a post which he retained to his death. In his hands Sèvres became the leading factory in Europe, and the re-

searches of an able band of assistants enabled him to lay the foundations of ceramic chemistry. He succeeded Haüy as professor of mineralogy in the Museum of Natural History; but he did not confine himself to mineralogy, for it is to him that we owe the division of reptiles into the four orders of Saurians, Batrachians, Chelonians and Ophidians; and fossil as well as living animals engaged his attention. His *Traité des arts céramiques* (1844) is a classic.

Brongniart was also the coadjutor of Cuvier in the admirable *Essai sur la géographie minéralogique des environs de Paris* (1811), originally published in *Ann. Mus. Hist. Nat.* (1808), xi.

**BRONN, HEINRICH GEORG** (1800-1862), German geologist, was born on March 3, 1800, at Ziegelhausen near Heidelberg. He took his degree as doctor of medicine at Heidelberg in 1821, and in the following year was appointed professor of natural history. His great work, *Lethaea Geognostica* (2 vols., Stuttgart, 1834-38; 3rd ed., with F. Römer, 3 vols., 1851-56), has been regarded as one of the foundations of German stratigraphical geology. Of his *Handbuch einer Geschichte der Natur* (1841 seq.), the third part included his famous *Index Palaeontologicus*. He died at Heidelberg on July 5, 1862.

**BRONSART VON SCHELLENDORF, PAUL** (1832-1891), Prussian general, was born at Danzig on Jan. 25, 1832. He entered the Prussian Guards in 1849. During the war of 1870 he was chief of a section on the Great General Staff, and conducted the preliminary negotiations for the surrender of the French at Sedan. As minister for war (1883-89) he carried out many important reforms in the Prussian army, in particular the introduction of the magazine rifle. He was appointed in 1889 to command the 1st Army Corps at Königsberg. He died on June 23, 1891, at his estate near Braunsberg. Bronsart's military writings include two important works: *Ein Rückblick auf die taktischen Rückblicke* (2nd ed., 1870), a pamphlet written in reply to Captain May's *Tactical Retrospect of 1866*; and *Der Dienst des Generalstabes im Frieden und im Kriege* (1st ed., 1876; 3rd ed., revised by General Meckel, 1893; new ed. by the author's son, Major Bronsart von Schellendorf, 1904), a comprehensive treatise on the duties of the general staff. The edition of 1893 was translated into English and issued officially to the British army as *The Duties of the General Staff*. Major Bronsart's new edition of 1904 was re-issued in English by the general staff, under the same title, in 1905.

**BRONTË, CHARLOTTE** (1816-1855), **EMILY** (1818-1848) and **ANNE** (1820-1849), English novelists, were the children of Patrick Brontë, an Irishman, who was born at Emsdale, Co. Down, on March 17, 1777. His paternal name was Brunty, but this he changed when he came to England. Although the son of humble parents, he had saved sufficient by the age of 25 to support him at Cambridge, and he entered St. John's college in 1802; then, on taking his degree four years later, he became curate of Wethersfield, Essex. At Hartshead-cum-Clifton, Yorkshire, where he had afterwards accepted a curacy, he married Maria, daughter of Thomas Branwell of Penzance, in 1812. She was a woman of delicate constitution, and died of cancer on Sept. 15, 1821, the mother of six children. Hartshead was the birthplace of her elder daughters, Maria (1813-1825) and Elizabeth (1814-1825); then when the family had moved to Thornton in the same county, Charlotte was born on April 21, 1816, Patrick Branwell in 1817, Emily Jane in August, 1818, and Anne in March 1820. Three months after Anne's birth, her father accepted the living of Haworth nine miles from Bradford, where he remained as rector for the rest of his life.

On the death of Mrs. Brontë, her husband invited his sister-in-law, Elizabeth Branwell, to live with his family at Haworth and to care for the children. She taught them the simple arts, but took her meals apart and had but slight intercourse with them. Branwell was educated by his father, but the latter, again, was of eccentric personality. A man of more than average intelligence (he was the author of two volumes of verse and other works) and undoubtedly fond of his six children, yet he was unsocial in his habits, living, even taking his meals alone, in his study. Thus the children were left very much to themselves in the bleak moor-

land rectory. Most of their time was spent in reading and in composition, varied with walks over the moors; and their output of youthful literature was enormous. In the course of 15 months, before she was 15 years of age, Charlotte was responsible for 23 "novels" alone, and in these writings, though they are of no intrinsic value, there is ample evidence of the astonishing precocity displayed by the young family.

The children were educated, during their early life, at home, except for a single year which Maria, Elizabeth, Charlotte and Emily spent in the Clergy Daughters' school at Cowan's Bridge. Here the fees were extremely low, and the food was correspondingly bad, while the discipline was unpardonably harsh. The horrors experienced at Cowan's Bridge were afterwards depicted by Charlotte in *Jane Eyre*, the name of the school being disguised as "Lowood"; but in this terrible picture it is necessary to allow for some exaggeration. In 1831 Charlotte was sent to Miss Margaret Wooler's school at Roe Head, Dewsbury, where she improved her drawing, French and composition; a year later, she returned home to assist in the instruction of her sisters. Although her shyness and reserve, her ignorance in some directions and her precocity in others, were noted by her school companions at Roe Head, this year of her life was a happy one, and bore fruit in the lasting friendships which she made with Mary Taylor and Ellen Nussey; her correspondence with Miss Nussey, indeed, which continued until her death, has provided much of what we know of her life. The next three years at Haworth, varied with visits to one or other of these two friends, were spent in reading and composition; but financial considerations, and especially the cost of supporting Branwell, persuaded her in 1835 to become governess with Miss Wooler, whose school, a year later, was removed to Dewsbury. Emily, accompanying her as a pupil, suffered from home-sickness and remained only three months; her place was then taken by Anne.

When Charlotte returned, on account of ill-health, to Haworth in 1838, she received an offer of marriage from Ellen Nussey's brother Henry, who was a clergyman, but this proposal, and a second one from a curate named Bryce, she refused. Her opinion of curates, whom in one place she describes as "a self-seeking, vain and empty race," was singularly embittered especially in view of her marriage later on. At this time her literary endeavours were somewhat damped by a letter which she received from Southey; she had sent him some manuscripts for his opinion, and his reply discouraged her. It was necessary to supplement the family income, and Charlotte made new plans. After serving for some months as nursery governess to the Sidgwicks of Stonegappe and to the Whites of Rawdon, Yorkshire, it occurred to her that she might attain to a greater independence if she herself possessed a school. Her aunt agreed to finance this experiment, and Charlotte proposed to visit the Continent in order to acquire a more thorough knowledge of modern languages; early in 1842 she went with Emily to Brussels as pupil in the Pensionnat Héger. The talent displayed by both his English students brought them to the special notice of the principal teacher, Constantin Héger, who was a man of unusual perception, and in whose hands they rapidly acquired a mastery of the language. After eight months, however, their studies were abruptly cut short by the death of their aunt on Oct. 29, 1842, and they both returned to England. Charlotte was on the whole happy in Brussels, but Emily pined for home and for the wild moorland air. Yet it seems clear that in Brussels, reserved as she was, Emily was better appreciated than Charlotte. Her passionate nature was more easily understood than Charlotte's decorous temperament. Elizabeth Branwell bequeathed to her nieces a sum which carried a certain independence with it, and, discarding the plan to found a school outside, the sisters now decided to take pupils at their father's house. Charlotte, however, in order to perfect her knowledge of French, accepted an invitation from M. Héger to return as instructress to Brussels, and the whole of 1843 she spent abroad. This year was not a happy one for her. She was lonely and grew depressed, her strong religious convictions were upset in a Roman Catholic country, while there is reason to believe that Mme. Héger became jealous of her. That the latter was unjust in her suspicions can

hardly be questioned. Certainly the letters which Charlotte sent her master after she had left Brussels finally, indicate a profound and moving attachment to him, but on the other hand there is not the slightest reason to suppose that M. Héger felt anything beyond friendliness and admiration for his pupil's talents. Charlotte returned to Haworth on Jan. 2, 1844.

The events which followed were not calculated to dissipate her gloom. Prospectuses were issued of the school which they proposed to found at the vicarage, but to that distant village no pupils were attracted. Worse than this disappointment was the moral collapse of Branwell, who about this time became a confirmed drunkard. He had been a lad of great promise, and it was hoped that he would become an artist; but his fondness for drink and for questionable companions, besides a more general feebleness of character, had manifested themselves early in his life and with disastrous results. From his youth onwards, his life was a series of disgraces. He squandered his parent's money in futile efforts to become a painter, and turned at last to private tuition as a means of earning his living. A short period of employment with the Leeds and Manchester railway terminated with his dismissal in 1842 on account of culpable negligence, and his career closed in 1845 when he was turned out of Mr. Robinson's house at Thorp Green, justly charged with making love to his employer's wife. The last years of his life were spent at Haworth, where he loafed at the village inn, shocked his sisters by his excesses, and finally died in delirium tremens.

In 1845 Charlotte came across some poems by Emily, and this led to the discovery that all three had written verse. A year later was published jointly a volume of poems by "Currer, Ellis and Acton Bell," the initials of these pseudonyms being those of the sisters; but the book was issued at their own expense, and only two copies were sold. Yet lack of notice did not deter them from further efforts. Each had a novel completed, for which they persevered in their endeavours to find a publisher. After a long and discouraging series of refusals, Charlotte was rewarded in 1847 by a polite letter from the firm of Smith and Elder, whose reader, while rejecting her novel *The Professor*, expressed himself very willing to examine the three-volume romance which she had mentioned to him. This was *Jane Eyre*, then in process of completion. Written in a period of sadness consequent upon Branwell's collapse, upon the growing blindness of her father, and upon the now manifest ill-health of her sisters, it was a work of incomparably greater power than *The Professor*. When she sent it to Smith and Elder, their reader, W. S. Williams, was so excited that he sat up all night reading it; and on its publication in Aug. 1847, success was immediate. "Currer Bell" at once became a famous name. Although the book was full of improbabilities and often displayed a naive ignorance of the world, its characterization was so sure and its passion so overwhelming, that its faults were easily forgotten. Charlotte's extreme shyness induced her to keep her name secret for some time after the appearance of *Jane Eyre*, but when she visited London in 1848, to see her publishers her real name could no longer be concealed from them.

Her stay in London was very brief, and on her return to Haworth, fresh misfortunes were awaiting her to dissipate whatever elation she may have felt. Branwell died on Sept. 24, and hardly had Charlotte recovered from the breakdown which followed this shock than Emily's health began rapidly to fail. She had been ill for some time, but now her breathing became difficult, and she suffered great pain. Yet it was only two hours before her death on Dec. 19, after she had struggled from her bed and dressed herself, that she would allow a doctor to be called. This stoicism was characteristic of her whole life. With her death the most enigmatical and perhaps the greatest of the Brontës passed away. Our record of her life is extremely meagre, for she was silent and reserved, and left no correspondence of interest, while her single novel, *Wuthering Heights*, darkens rather than solves the mystery of her spiritual existence. This book had been accepted early in 1847 by J. Cautley Newby, of London, but its publication was delayed until after the appearance of *Jane Eyre*. Its greatness was not soon recognized, and many years elapsed before anything beyond a clumsiness of construction and a sav-

agery of mood were generally perceived in it. So difficult is the book to "place," and so charged with a significance which it is difficult to explain, that doubts of all kinds have grown up round it. At first it was widely regarded as an early work of "Currer Bell," and later on as a creation of Branwell's; but there is no reason for rejecting Charlotte's statement that the novel was by her sister, while there is good evidence in Branwell's writings for not crediting him with so great a book as this. It is true that he claimed at least a share of the authorship, but this was no more, probably, than the idle boast of a drunkard. Emily's poems (she alone of the sisters possessed a true poetic gift) throw most light upon her mind and heart. From them we learn of her stoicism, her deism and of her passion for the moors which almost amounted to "nature worship"; and there are also passages which plainly indicate that she had had mystical experiences. Besides the poems, which give some idea of her personality, there is an idealized portrait of Emily in the heroine of Charlotte Brontë's *Shirley*; but of external biographical material little that is of value has been preserved.

On May 26 of the next year Anne died at Scarborough, where she had gone for the sake of her health. Gentle, open and submissive, she was in many respects the antithesis of Emily, but she was nevertheless the deepest in her confidence. Along with *Wuthering Heights*, she had submitted a novel to Newby, and this, *Agnes Grey*, was also accepted. Both books were published in Dec. 1847, but Anne's novel achieved no more success than her sister's. *Agnes Grey* was succeeded by *The Tenant of Wildfell Hall*, which was issued by the same publisher in the following June; but no outstanding merit can be claimed for either of Anne's novels, though they have perhaps suffered mainly by comparison with the work of her greater sisters. Her verses were graceful and often expressed with considerable beauty the pathos and gentleness of her personality, while some of her hymns are sung to this day.

In the interval between the death of Branwell and of Emily, Charlotte had been engaged upon a new novel—*Shirley*. Two-thirds were written, but the story was then laid aside while its author was nursing her sister Anne. She completed the book after Anne's death, and it was published in Oct. 1849. The following winter she visited London as the guest of her publisher, Mr. George Smith, and was introduced to Thackeray, to whom she had dedicated *Jane Eyre*. The following year she repeated the visit, sat for her portrait to George Richmond, and was considerably lionized by a host of admirers. In Aug. 1850 she visited the English lakes as the guest of Sir James Kay-Shuttleworth, and met Mrs. Gaskell, Miss Martineau, Matthew Arnold and other interesting men and women. During this period her publishers assiduously lent her books, and her criticisms of them contained in many letters to Mr. George Smith and Mr. Smith Williams make very interesting reading, though she could never separate artistic and moral values. In 1851 she received a third offer of marriage, this time from Mr. James Taylor, who was in the employment of her publishers. A visit to Miss Martineau at Ambleside, Westmorland and also to London to the Great Exhibition made up the events of this year. On her way home she visited Manchester and spent two days with Mrs. Gaskell. During the year 1852 she worked hard on *Villette*, which was published in Jan. of 1853. In Sept. of that year she received a visit from Mrs. Gaskell at Haworth; in May 1854 she returned it, remaining three days at Manchester, and planning with her hostess the details of her marriage with her father's curate, Arthur Bell Nicholls (1817–1906), who had long been a pertinacious suitor but had been discouraged by Mr. Brontë. The marriage took place in Haworth church on June 29, 1854. Charlotte and her husband spent their honeymoon in Ireland returning to Haworth, where they made their home with Mr. Brontë, Mr. Nicholls having pledged himself to continue in his position as curate to his father-in-law. After less than a year of married life, however, Charlotte Nicholls died of an illness following on childbirth, on March 31, 1855. She was buried in Haworth church by the side of her mother, Branwell and Emily. The father died in 1861, and then her husband returned to Ireland, surviving until 1906.

The bare recital of the Brontë story can give no idea of its undying interest, its exceeding pathos. Their life as told by their biographer Mrs. Gaskell is as interesting as any novel. Their achievement, however, will stand on its own merits. Anne Brontë's two novels, it is true, though constantly reprinted, survive principally through the exceeding vitality of the Brontë tradition. Emily is great alike as a novelist and as a poet. Her "Old Stoic" and "Last Lines" are among the finest achievement of poetry that any woman has given to English literature. *Wuthering Heights* stands alone as a monument of intensity owing nothing to tradition, nothing to the achievement of earlier writers. It was a thing apart, passionately sincere, unforgettable, haunting in its grimness, its grey melancholy. Emily Brontë has a sure and certain place in English literature. As a poet or maker of verse Charlotte Brontë is undistinguished, but there are passages of pure poetry of great magnificence in her four novels, and particularly in *Villette*. The novels *Jane Eyre* and *Villette* will always command attention whatever the future of English fiction, by virtue of their intensity, their independence, their rough individuality. It is essential to realize the early Victorian atmosphere in which Emily and Charlotte Brontë wrote their novels if the greatness of their achievement is to be realized. They shocked their contemporaries by showing their heroines consumed by naked passion, and made a breach in the then conventional theory that woman was merely the loved and not the lover. The problem that has tormented all their biographers, and critics is how they learned to know passion as they did when their lives were spent in the Haworth parsonage so familiar to all their readers. Their world was built up in their own imagination, and it is this which makes its truth and its universal appeal.

*The Life of Charlotte Brontë*, by Mrs. Gaskell, was first published in 1857. Owing to the many controversial questions it aroused, as to the identity of Lowood in *Jane Eyre* with Cowan Bridge school, as to the relations of Branwell Brontë with his employer's wife, as to the supposed peculiarities of Mr. Brontë, and certain other minor points, the third edition was considerably changed. *The Life* has been many times reprinted, but may be read in its most satisfactory form in the Haworth edition (1902), issued by the original publishers, Smith, Elder and Co. To this edition are attached a great number of letters written by Charlotte Brontë to her publisher, George Smith. The first new material supplied to supplement Mrs. Gaskell's *Life* was contained in *Charlotte Brontë; a Monograph*, by T. Wemyss Reid (1877). This book inspired A. C. Swinburne to issue separately a forcible essay on Charlotte and Emily Brontë, under the title of *A Note on Charlotte Brontë* (1877). A further collection of letters written by Charlotte Brontë was contained in *Charlotte Brontë and Her Circle*, by Clement Shorter (1896), and interesting details can be gathered from *The Life of Charlotte Brontë*, by Augustine Birrell (1887). *The Brontës in Ireland*, by William Wright (1893), *Charlotte Brontë and Her Sisters*, by Clement Shorter (1906), and the Brontë Society publications, edited by Butler Wood (1895–1907). A. M. F. Robinson (Mme. Duclaux) wrote a separate biography of Emily Brontë in 1883, and an essay in her *Grands Écrivains d'outre-Manche*. *The Brontës' Life and Letters*, by Clement Shorter (1907) contains the whole of C. Brontë's letters in chronological order. Four additional letters, addressed by Charlotte to M. Héger in 1844–45, show the depths of Charlotte's attachment. The most important of the later studies on the Brontë sisters are May Sinclair, *The Three Brontës*; E. Dimnet, *Les Soeurs Brontë* (1910; E. trans. *The Brontë Sisters*, 1927); Romer Wilson, *All Alone: the life of Emily Brontë* (1928); Rosamonde Langbridge, *Charlotte Brontë, a psychological study* (1929); Charles Simpson, *Emily Brontë* (1930).

**BRONTE**, province of Catania, Sicily, on the western slopes of Mt. Etna, 24m. N.N.W. of Catania direct, and 34m. by rail. Pop. (1921), 17,790 (town); 20,014 (commune). The town was founded by Charles V., with an estate originally belonging to the monastery of Maniacium (Maniace), and was granted to Nelson by Ferdinand IV. of Naples in 1799 as a dukedom, which is still held by a member of the Hood family.

**BRONTOSAURUS**, a gigantic vegetarian Dinosaur, allied to *Diplodocus* (*q.v.*), but somewhat larger, reaching a length of 70 feet. *Brontosaurus* occurs in the Upper Jurassic of Wyoming. The neck and tail were immensely long and it is probable that the animal was semi-aquatic. (See REPTILES; DINOSAURS.)

**BRONX, THE**, a borough of New York city (*q.v.*) since 1898; formerly a district comprising several towns in Westchester county. Area, 42 square miles, population (1930) 1,265,258.

**BRONZE**, an alloy formed wholly or chiefly of copper and tin in variable proportions. The word has been etymologically connected with the same root as appears in "brown," but according to M. P. E. Berthelot (*La Chimie au moyen âge*) it is a place-name derived from *aes Brundisianum* (cf. Pliny, *Nat. Hist.* xxxiii. ch. ix. §45, "specula optima apud maiores fuerunt Brundisiana, stanno et aere mixtis"). A Greek ms. of about the 11th century in the library of St. Mark's, Venice, contains the form *βροντήσιον* and gives the composition of the alloy as 1 lb. of copper with 2 oz. of tin. The product obtained by adding tin to copper is more fusible than copper and thus better suited for casting; it is also harder and less malleable. A soft bronze or *gun-metal* is formed with 16 parts of copper to 1 of tin, and a harder gun-metal, such as was used for bronze ordnance, when the proportion of tin is about doubled. The *steel bronze* of Colonel Franz Uchatius (1811-81) consisted of copper alloyed with 8% of tin, the tenacity and hardness being increased by cold-rolling. Bronze containing about 7 parts of copper to 1 of tin is hard, brittle and sonorous, and can be tempered to take a fine edge. *Bell-metal* varies considerably in composition, from about 3 to 5 parts of copper to 1 of tin. In *speculum metal* there are 2 to 2½ parts of copper to 1 of tin. Statuary bronze may contain from 80 to 90% of copper, the residue being tin, or tin with zinc and lead in various proportions. The bronze used for the British and French copper coinage consists of 95% copper, 4% tin and 1% zinc.

Many copper-tin alloys employed for machinery bearings contain a small proportion of zinc, which gives increased hardness. "Anti-friction metals," also used in bearings, are copper-tin alloys in which the amount of copper is small and there is antimony in addition. Of this class an example is "Babbitt's metal," invented by Isaac Babbitt (1799-1862); it originally consisted of 24 parts of tin, 8 parts of antimony and 4 parts of copper, but in later compositions for the same purpose the proportion of tin is often considerably higher.

**Phosphor Bronze.**—Bronze is improved in quality and strength when fluxed with phosphorus. Alloys prepared in this way, and known as *phosphor bronze*, may contain only about 1% of phosphorus in the ingot, reduced to a mere trace after casting but their value is nevertheless enhanced for purposes in which a hard strong metal is required, as for pump plungers, valves, the bushes of bearings, etc. Bronze again is improved by the presence of manganese in small quantity, and various grades of *manganese bronze*, in some of which there is little or no tin but a considerable percentage of zinc, are used in mechanical engineering.

Alloys of copper with aluminium, though often nearly or completely destitute of tin, are known as *aluminium bronze*, and are valuable for their strength and the resistance they offer to corrosion. By the addition of a small quantity of silicon the tensile strength of copper is much increased; a sample of such *silicon bronze*, used for telegraph wires, on analysis was found to consist of 99.94% of copper, 0.03% of tin, and traces of iron and silicon.

The bronze (Gr. *χαλκός*, Lat., *aes*) of classical antiquity consisted chiefly of copper, alloyed with one or more of the metals, zinc, tin, lead and silver, in proportions that varied as times changed, or according to the purposes for which the alloy was required. Among bronze remains the copper is found to vary from 67 to 95%. From the analysis of coins it appears that for their bronze coins the Greeks adhered to an alloy of copper and tin till 400 B.C., after which time they used also lead with increasing frequency. Silver is rare in their bronze coins. The Romans also used lead as an alloy in their bronze coins, but gradually reduced the quantity, and, under Caligula, Nero, Vespasian, and Domitian, coined pure copper coins; afterwards they reverted to the mixture of lead. So far the words *χαλκός* and *aes* may be translated as bronze. Originally, no doubt, *χαλκός* was the name for pure copper. It is so employed by Homer, who calls it *ἐρυθρός* (red), *αἰθώς* (glittering), *φαιρός* (shining), terms which apply only to copper. But instead of its following from this that the process of alloying copper with other metals was not practised in the time of the poet, or was unknown to him, the contrary would seem to be the case from the passage (*Iliad* xviii.

474) where he describes Hephaestus as throwing into his furnace copper, tin, silver and gold to make the shield of Achilles, so that it is not always possible to know whether when he uses the word *χαλκός* he means copper pure or alloyed. Still more difficult is it to make this distinction when we read of the mythical Dactyls of Ida in Crete or the Telchines or Cyclopes being acquainted with the smelting of *χαλκός*. It is not, however, likely that later Greek writers, who knew bronze in its true sense, and called it *χαλκός*, would have employed this word without qualification for objects which they had seen unless they had meant it to be taken as bronze. When Pausanias (iii. 17. 6) speaks of a statue, one of the oldest figures he had seen of this material, made of separate pieces fastened together with nails, we understand him to mean literally bronze, the more readily since there exist very early figures and utensils of bronze so made.

For the use of bronze in art, see METAL-WORK.

**BRONZE AGE:** see ARCHAEOLOGY.

### BRONZE AND BRASS ORNAMENTAL WORK

The use of bronze dates from remote antiquity. This important metal is an alloy composed of copper and tin, in proportions which vary slightly, but may be normally considered as nine parts of copper to one of tin. Other ingredients which are occasionally found are more or less accidental. The result is a metal of a rich golden brown colour, capable of being worked by casting—a process little applicable to its component parts, but peculiarly successful with bronze, the density and hardness of the metal allowing it to take any impression of a mould, however delicate.

This process is known as *cire perdue*, and is the most primitive and most commonly employed through the centuries, having been described by the monk Theophilus, and also by Benvenuto Cellini. Briefly, it is as follows: A core, roughly representing the size and form of the object to be produced, is made of pounded brick, plaster or other similar substance and thoroughly dried. Upon this the artist overlays his wax, which he models to the degree required in his finished work. Passing from the core through the wax and projecting beyond are metal rods. The modelling being completed, the outer covering which will form the mould has to be applied; this is a liquid formed of clay and plaster sufficiently thin to find its way into every detail of the wax model. Further coatings of liquid are applied, so that there is, when dry, a solid outer coating and a solid inner core held together by the metal rods, with the work of art modelled in wax between. Heat is applied and the wax melts and runs out, and the molten metal is poured in and occupies every detail which the wax had filled. When cool, the outer casing is carefully broken away, the core raked out as far as possible, the projecting rods are removed and the object modelled in wax appears in bronze. If further finish is required it is obtained by tooling. (W. W. W.)

### GREEK AND ROMAN

Copper came into use in the Aegean area towards the end of the predynastic age of Egypt about 3500 B.C. The earliest known implement is a flat celt, which was found on a neolithic house-floor in the central court of the palace of Knossos in Crete, and is regarded as an Egyptian product. Bronze was not generally used until a thousand years or more later. Its first appearance is probably in the celts and dagger-blades of the Second City of Troy, where it is already the standard alloy of 10% tin. It was not established in Crete until the beginning of the Middle Minoan age (M.M.I., c. 2000 B.C.). The Copper age began in northern Greece and Italy c. 2500 B.C., much later than in Crete and Anatolia, and the mature Italian Bronze age of Terremare culture coincided in time with the Late Aegean (Mycenaean) civilization (1600-1000 B.C.). The original sources both of tin and copper in these regions are unknown.

**Earliest Implements and Utensils.**—Tools and weapons, chisels and axe-heads, spearheads or dagger-blades, are the only surviving artifacts of the Copper age, and do not show artistic treatment. But some Early Minoan pottery forms are plainly copied from metal prototypes, cups and jugs of simple construction and rather elaborate design. The cups are conical and some

#### GREEK AND ROMAN BRONZE FROM 1600 B. C. TO A. D. 400

1. Restoration of a bronze dagger of the later Minoan period (about 1600–1100 B.C.) from a grave shaft at Mycenae. It is inlaid with gold and niello and has a floral design. In the original (National Museum, Athens) only the blade is preserved. 2. Reproduction of Mycenaean dagger similar to fig. 1. The design on the blade represents cats hunting birds. 3. Table of variegated marble with bronze fittings found at Boscoreale, near Pompeii; the bronze rim

around the top has palmetto and rosette ornaments inlaid with silver and niello; the first century A.D. 4. Hellenistic statuette of negro boy on pedestal; about 200 B.C. 5. Greek bronze helmet found at Salonika, executed about 500 B.C. 6. Handle of Greek amphora (Pourtales vase) with silver inlay; 500 B.C.

#### GREEK AND ROMAN BRONZES

1. Man leaping over a bull. Plaster cast of a Minoan bronze statuette, probably used as a weight
2. Bronze bust of a female figure found in the Polledraro tomb at Vulci. The base is ornamented with charioteers, lions and winged monsters. Early 6th century B.C.
3. Bronze footrest of a couch inlaid with silver. Found at Amilernum. Conservatori Museum, Rome
4. Fibula of the geometrical period, engraved with a ship, which the helmsman steers with his foot
5. The Ficoroni cista in the Villa Giulia, Rome, finest of the engraved Latin boxes. It is decorated with scenes depicting the myth of the Argonauts and signed by a Roman artist. 3rd century B.C.
6. Cast of bronze relief, probably from a mirror case, showing Aphrodite and Anchises on Mount Ida

### GREEK AND ROMAN BRONZE

1. Greek mirror of polished bronze. 5th century B.C. The figure forming the stand probably represents Aphrodite. On each side of the attachment connecting the handle with the disk is a flying Eros, and along the edge of the disk are two hounds pursuing a fox and a rabbit
2. Etruscan vase from Capua on a tripod of the 5th century B.C. Figures of horsemen decorate the rim of the vase, with a goddess in the centre. The tripod is an Etruscan imitation of Ionic Greek work
3. An Italic bronze mirror of the 4th to the 3rd century B.C. As in less common mirrors of this period, found chiefly at Praeneste, the handle is cast in one piece with the disk. The back of the disk is decorated with an engraved scene showing the Dioscuri with two women
4. Tripod of simple open-work construction from Cyprus. Late Mycenaean (1000-800 B.C.). Rim is engraved with figures of lions pursuing stags
5. Tripod of three satyrs from Herculaneum. In the Museo Nazionale, Naples

## BRONZE STATUETTE OF THE GODDESS CYBELE IN HER PROCESSIONAL CART, DRAWN BY TWO LIONS

This group statuette, found and put together in Rome, probably dates from the 2nd century A.D. It is thought to represent a ceremony in the chief festival of Cybele, the nature goddess, which consisted in carrying the goddess' statue on a chariot from her temple on the Palatine to the river Arno, where it was bathed and brought back to the temple.

The group is 3 feet 5 inches in length and represents Cybele carrying a drum in one hand and a bowl in the other. The upper surface of the chariot and the side pieces of the throne are decorated with floral designs cast separately and soldered on.

times have a stem-foot; there are oval jars with long tubular spouts, and beaked jugs with round shoulders set on conical bodies. Heads of rivets which tie the metal parts together are often reproduced as a decorative element in clay. The spouted jars and a pierced type of axe-head indicate that the metallurgical connections of Early Minoan Crete were partly Mesopotamian.

### MINOAN AND MYCENAEAN

**Weapons and Implements.**—It is known that Middle Minoan bronze work flourished as an independent native art. To the very beginning of this epoch belongs the largest sword of the age, found in the palace of Mallia. It is a flat blade, 79 cm. long, with a broad base and a sharp point; there is a gold and crystal hilt but no ornament on the blade. A dagger of somewhat later date, now in the Metropolitan Museum of New York, is the earliest piece of decorated bronze from Crete. Both sides of the blade are engraved with drawings: bulls fighting and a man hunting boars in a thicket. Slightly later again (M.M. 111) are a series of splendid blades from mainland Greece, which must be attributed to Cretan craftsmen, with ornament in relief, or incised, or inlaid with gold, silver and niello. The most elaborate inlays, pictures of men hunting lions and cats hunting birds, are on daggers from the shaftgraves of Mycenae (*see GOLDSMITHS' WORK*). These large designs cover the whole of the flat blade except its edge, but on swords, best represented by finds at Knossos, the ornament is restricted to the high midribs which are an essential feature of the longer blades. The type belongs to the beginning of the Late Minoan (Mycenaean) age. The hilt is made in one piece with the blade; it has a horned guard, a flanged edge for holding grip-scales, and a tang for a pommel. The scales were ivory or some other perishable substance and were fixed with bronze rivets; the pommels were often made of crystal. A rapier from Zapher Papoura (Knossos) is 91.3 cm. long; its midrib and hilt-flange are engraved with bands of spiral coils, and its rivet-heads (originally gold-cased) with whorls. Ordinary Mycenaean blades are enriched with narrow mouldings, parallel to the midribs of swords and daggers, or to the curved backs of one-edged knives. The spearheads have hammered sockets. Other tools and implements are oval two-edged knives, square-ended razors, cleavers, chisels, hammers, axes, mattocks, ploughshares and saws. Cycladic and mainland Greek (Helladic) weapons show no ornament but include some novel types. A tanged spearhead has a slit (Cycladic) or slipped (Helladic) blade for securing the shaft; and the halberd, a west European weapon, was in use in Middle Helladic Greece. There are few remains of Mycenaean metal armour; a plain cheek-piece from a helmet comes from Ialysos in Rhodes, and a pair of greaves from Enkomi in Cyprus. One of the greaves has wire riveted to its edge for fastening.

**Utensils.**—Middle and Late Minoan and Mycenaean vessels are many. First in size are some basins found at Tylissos in Crete, the largest measuring 1.40 metres in diameter. They are shallow hemispherical bowls with two or three loop-handles riveted on their edges, and are made in several sections. The largest is composed of seven hammered sheets, three at the lip, three in the body, and one at the base. This method of construction is usual in large or complicated forms. The joints of necks and bodies of jugs and jars were often masked with a roll-moulding. Simpler and smaller forms were also cast. The finest specimens of such vases come from houses and tombs at Knossos. Their ornament is applied in separate bands, hammered or cast and chased, and soldered on the lip or shoulder of the vessel. A richly decorated form is a shallow bowl with wide ring-handle and flat lip, on both of which are foliate or floral patterns in relief.

A notable shape, connecting prehistoric with Hellenic metallurgy is a tripod-bowl, a hammered globular body with upright ring-handles on the lip and heavy cast legs attached to the shoulder.

**Statuettes.**—Purely decorative work is rare among Minoan bronzes, and is comparatively poor in quality. There are several statuettes, very completely modelled but roughly cast; they are solid and unchased, with blurred details. Well known are a figure

of a praying or dancing woman from the Troad, now at Berlin, and another from Hagia Triada; praying men from Tylissos and Psychro, another in the British Museum, a flute-player at Leyden, and an ambitious group of a man turning a somersault over a charging bull, in an English collection. This last was perhaps a weight; there are smaller Mycenaean weights in the forms of animals, filled with lead, from Rhodes and Cyprus. Among the latest Mycenaean bronzes found in Cyprus are several tripod-stands of simple openwork construction, a type that has also been found with transitional material in Crete and in Early Iron age (Geometric) contexts on the Greek mainland. Some more elaborate pieces, cast in designs of ships and men and animals, belong to a group of bronzes found in the Idaean cave in Crete, most of which are Asiatic works of the ninth or eighth century B.C. The openwork tripods may have had the same origin. They are probably not Greek.

### HELLENIC AND ITALIAN

**The Geometric Period.**—During the dark ages of the transition from bronze to iron the decorative arts stood almost still but industrial metalwork was freely produced. There are a few remains of Geometric bronze vessels, but as in the case of the Early Minoan material, metal forms are recorded in their pottery derivatives. Some vase-shapes are clearly survivals from the Mycenaean repertory, but the greater number are new, and these are elementary and somewhat clumsy, spherical or biconical bodies, huge cylindrical necks with long band-handles and no spouts. Ceramic painted ornament also reflects originals of metal, and some scraps of thin bronze plate embossed with rows of knobs and lightly engraved in hatched or zig-zag outline doubtless represent the art which the newcomers brought with them to Greek lands. This kind of decorative work is better seen in bronzes of the closely related Villanova culture of north and central Italy. A novel feature is the application of small figures in the round, particularly birds and heads of oxen, as ornaments of handles, lids and rims. The Italian Geometric style developed towards complication, in crowded narrow bands of conventional patterns and serried rows of ducks; but contemporary Greek work was a refinement of the same crude elements. Engraving appears at its best on the large catch-plates of fibulae, some of which bear the earliest known pictures of Hellenic mythology. Small statuettes of animals were made for votive use and also served as seals, the devices being cast underneath their bases. There is a large series of such figures, mostly horses, standing on engraved or perforated plates, which were evidently derived from seals; among the later examples are groups of men and centaurs. Pieces of tripod-cauldrons from Olympia have animals lying or standing on their upright ring-handles, which are steadied by human figures on the rims. Handles and legs are cast, and are enriched with graceful geometric mouldings. The bowls are wrought, and their shape and technique are pre-Hellenic. Here are two of the elements of classical Greek art in full course of development: the forms and processes of earlier times invigorated by a new aesthetic sense.

**Oriental Influence.**—A third element was presently supplied in the rich repertory of decorative motives, Egyptian and Assyrian, that was brought to Europe by Phoenician traders or fetched from Asia by adventurous Greeks. A vast amount of oriental merchandise found its way into Greece and Italy c. 800 B.C. There is some uncertainty about the place of manufacture of much of the surviving bronze work, but the same doubt serves to emphasize the close resemblance that these pieces, Phoenician, Greek or Etruscan, bear to their Assyrian or Egyptian models. Foremost among them are the bowls and shields from the Idaean cave in Crete. These interesting bowls are embossed with simple bands of animals, the shields with bold and complicated designs of purely oriental character. It is unlikely that a Greek craftsman in this vigorous Geometric age could suppress his style and produce mechanical copies such as these. So in Etruscan graves beside inscribed Phoenician bowls there have been found great cauldrons, adorned with jutting heads of lions and griffins, and set on conical stands which are embossed with Assyrian winged monsters.

**Classical Greek and Etruscan.**—The bowl and stand were favourite archaic forms. The Greek stand was a fusion of the cast-rod tripod and the embossed cone. Some early examples have large triangular plates between the legs, worked in relief; but the developed type has separate legs and stays of which the joints are masked with decorative rims and feet and covering-plates. These ornaments are cast and chased, and are modelled in floral, animal and human forms. The feet are lions' paws, which sometimes clasp a ball or stand on toads; the rims and plaques bear groups of fighting animals, warriors, revellers or athletes, nymphs and satyrs, or mythological subjects in relief. Feasters recline and horsemen gallop on the rims of bowls; handles are formed by single standing figures, arched pairs of wrestlers, lovers holding hands, or two vertical soldiers carrying a horizontal comrade. Nude athletes serve as handles for all kinds of lids and vessels, draped women support mirror-disks around which love-gods fly, and similar figures crown tall shafts of candelabra. Handle-bases are modelled as satyr-masks, palmettes and sphinxes. This is Greek ornament of the 6th and later centuries. Its centres of manufacture are not precisely known, but the style of much archaic work points to Ionia. Etruscan fabrics approach their Greek originals so closely that it is not possible to separate them in technique or design, and the Etruscan style is no more than provincial Greek. Bronze was quite plentiful in Italy, the earliest Roman coinage was of heavy bronze, and there is literary evidence that Etruscan bronzes were exported. The process of line engraving seems to have been a Latin speciality; it was applied in pictorial subjects on the backs of mirrors and on the sides of large cylindrical boxes, both of which are particularly connected with Praeneste. The finest of all such boxes, the Ficoroni *cista* in the Villa Giulia at Rome, bears the signature of a Roman artist. These belong to the 4th and 3rd centuries B.C. Greek mirrors of the same period are seldom engraved; the disk is usually contained in a flat box which has a *repoussé* design on its lid.

**Hellenistic and Roman.**—Hellenistic and Graeco-Roman forms are more conventional, and the new motives that belong to these periods are mostly floral. Busts and masks are the usual handle-plaques and spouts; heads and limbs of various animals are allotted certain decorative functions, as for instance the spirited mules' heads mentioned by Juvenal, which formed the elbow-rests of dining-couches. These structural pieces are frequently inlaid with silver and niello. Bronze chairs and tables were commonly used in Hellenistic and Roman houses, and largely took the place of the monumental vases that were popular in earlier days. Small household articles, such as lamps, when made of bronze are usually Roman, and a peculiarly Roman class of personal ornament is a large bronze brooch inlaid with coloured enamels, a technique which seems to have had a Gaulish origin.

**Fine Art.**—Bronze statuettes were also made in every period of antiquity for votive use, and at least in Hellenistic and Roman times for domestic ornaments and furniture of household shrines. But the art of bronze statuary hardly existed before the introduction of hollow casting, about the middle of the 6th century, B.C. The most primitive votive statuettes are oxen and other animals, which evidently represent victims offered to the gods. They have been found abundantly on many temple sites. But classical art preferred the human subject, votaries holding gifts or in their ordinary guise, or gods themselves in human form. Such figures are frequently inscribed with formulas of dedication. Gods and goddesses posed conformably with their traditional characters and bearing their distinctive attributes are the most numerous represented class of later statuettes. They are a religious *genre*, appearing first in 4th century sculpture and particularly favoured by Hellenistic sentiment and Roman pedantry. Many of them were doubtless votive figures, others were images in domestic shrines, and some were certainly ornaments. Among the cult-idols are the dancing Lares, who carry cornucopias and libation-bowls. The little Heracles that Lysippus made for Alexander was a table-ornament (*epitrapezios*): he was reclining on the lion's skin, his club in one hand, a wine-cup in the other.

**Technique.**—With the invention of hollow casting bronze became the most important medium of monumental sculpture,

largely because of its strength and lightness, which admitted poses that would not be possible in stone. But the value of the metal in later ages has involved the destruction of nearly all such statues (*see* Musnolian, *North African Archaeology*). The few complete figures that survive, and a somewhat more numerous series of detached heads and portrait-busts, attest the excellence of ancient work in this material. The earliest statuettes are chiselled, wrought and welded; next in time come solid castings, but larger figures were composed of hammered sections, like domestic utensils, each part worked separately in *repoussé* and the whole assembled with rivets (*σφυρήλατα*). Very little of this flimsy fabric is extant, but chance has preserved one bust entire, in the Polledrara Tomb at Vulci. This belongs to the early 6th century B.C., the age of *repoussé* work. The process was soon superseded in such subjects by hollow casting, but beaten reliefs, the household craft from which Greek bronze work sprang, persisted in some special and highly perfected forms, as handle-plates on certain vases, *emblemata* on mirror-cases, and particularly as ornaments of armour, where light weight was required. The Siris bronzes in the British Museum are shoulder-pieces from a 4th century cuirass. Casting was done by the *cire-perdue* process in clay moulds, but a great deal of labour was spent on finishing. The casts are very finely chased, and most large pieces contain patches, inserted to make good the flaws. Heads and limbs of statues were cast separately and adjusted to the bodies: besides the evidence of literature and of the actual bronzes there is an illustration of a dismembered statue in the making on a painted vase in Berlin.

Pliny and other ancient writers have much to say in regard to various alloys of bronze—Corinthian, Delian, Aeginetan, Syracusan—in regard to their composition and uses and particularly to their colour effects, but their statements have not been confirmed by modern analyses and are sometimes manifestly false. Corinthian bronze is said to have been first produced by accident in the Roman burning of the city (146 B.C.) when streams of molten copper, gold and silver mingled. Similar tales are told by Plutarch and Pliny about the artists' control of colour: Silanion made a pale-faced Iocasta by mixing silver with his bronze, Aristonidas made Athamas blush with an alloy of iron. There is good evidence that Greek and Roman bronzes were not artificially patinated, though many were gilt or silvered. Plutarch admires the blue colour of some very ancient statues at Delphi, and wonders how it was produced; Pliny mentions a bitumen wash, but this was doubtless a protective lacquer; and a 4th century inscription from Chios records the regulations made there for keeping a public statue clean and bright. (*See* GREEK ART; ROMAN ART; SCULPTURE; MEDALS AND COINS; SEALS.) (E. J. F.)

#### EUROPEAN BRASS AND BRONZE

This article is not concerned with sculpture in bronze, but rather with the many artistic applications of the metal in connection with architecture, or with objects for ecclesiastical and domestic use. Why bronze was preferred in Italy, iron in Spain and Germany and brass in the Low Countries cannot be satisfactorily determined; national temperament is impressed on the choice of metals and also on the methods of working them. Centres of artistic energy shift from one place to another owing to wars, conquests or migrations.

Leaving alone remote antiquity and starting with imperial Rome, the working of bronze, inspired probably by conquered Greece, is clearly seen. There are ancient bronze doors in the Temple of Romulus in the Forum; others from the baths of Caracalla are in the Lateran church, which also contains four fine gilt bronze fluted columns of the Corinthian order. The Naples museum contains a large collection of domestic utensils of bronze, recovered from the buried towns of Pompeii and Herculaneum, which show a high degree of perfection in the working of the metal, as well as a wide application of its use. A number of Moorings in the form of finely-modelled animal heads, made in the 1st century A.D., and recovered from Lake Nemi in the Alban hills some years ago, show a further acquaintance with the skillful working of this metal. The chair of Dagobert in the Bibliothèque

ETRUSCAN BRONZE CHARIOT

This unique example of repoussé bronze was found in 1902 in a tomb near Monteleone, Italy; it has been mounted upon a modern wooden frame. Its artistic merit is enhanced by the remarkable green patina caused by the centuries during which it was buried.

### "PORTA DEL PARADISO" ON THE BAPTISTRY, FLORENCE

The bronze east door on the baptistry of San Giovanni, designed by Lorenzo Ghiberti, is a famous example of Italian metal-work of the 15th century. The panels represent in relief scenes from the Old Testament. Each portal is surrounded by statuettes of scriptural personages, and the door frame is ornamented with a border of foliage, flowers, birds and animals in Renaissance style. The beauty of these portals caused Michelangelo to declare them worthy to be the gates of Paradise.

### CANDLESTICKS, LIGHTHOLDERS AND A LECTERN

1. The Gloucester candlestick. English, about 1110. It is gilt bell-metal and stands nearly 2 feet high.
2. One of a pair of chased ormolu candelabra for four lights. French, last quarter of the 18th century.
3. English brass chandelier, probably of the 14th century. The lights are arranged in two tiers, the lower one for eight candles. The stem has a bird's nest at the top.
4. One of a pair of chased ormolu candelabra for six lights. French, last quarter of the 18th century.
5. More common types of pricket and socket altar candlesticks in use in Europe during the Middle Ages.
6. Lectern in St. Mary's college, Oscott. The shaft, with pierced tracery, rests on scouken long and short feet. The traditional symbol of St. John the Divine. The outspread wings at the top form the book-rest.

Nationale, Paris, appears to be a Roman bronze curule chair, with back and part of the arms added by the abbot Suger in the 12th century.

Byzantium, from the time when Constantine made it the seat of empire, in the early part of the 4th century, was for 1,000 years renowned for its work in metal. Its position as a trade centre between East and West attracted all the finest work provided by the artistic skill of craftsmen from Syria, Egypt, Persia, Asia Minor and the northern shores of the Black sea, and for 400 years, until the beginning of the Iconoclastic period in the first half of the 8th century, its output was enormous. Several Italian churches still retain bronze doors cast in Constantinople in the later days of the Eastern empire, such as those presented by the members of the Pantaleone family, in the latter half of the 11th century, to the churches at Amalfi, Monte Cassino, Atrani and Monte Gargano. Similar doors are at Salerno; and St. Mark's, Venice, also has doors of Greek origin.

The period of the Iconoclasts fortunately synchronized with the reign of Charlemagne, whose power was felt throughout western Europe. The craftsmen who were forced to leave Byzantium were welcomed by him in his capitals of Cologne and Aix-la-Chapelle and their influence was also felt in France. Another stream passed by way of the Mediterranean to Italy, where the old classical art had decayed owing to the many national calamities, and here it brought about a revival. In the Rhineland the terms "Rhenish-Byzantine" and "Romanesque," applied to architecture and works of art generally, testify to the provenance of the style of this and the succeeding period. The bronze doors of the cathedral of Aix-la-Chapelle are of classic design and date probably from Charlemagne's time. All through the Middle Ages the use of bronze continued on a great scale, particularly in the 11th and 12th centuries. Bernward, bishop of Hildesheim, a great patron of the arts, had bronze doors made for St. Nicholas' church (afterwards removed to the cathedral) which were set up in 1015; great doors were made for Augsburg somewhere between 1060 and 1065, and for Mainz shortly after the year 1000. A prominent feature on several of these doors is seen in finely-modelled lion heads, with conventional manes and with rings hanging from their jaws. These have their counterpart in France and Scandinavia as well as in England, where they are represented by the so-called sanctuary knocker at Durham cathedral. Provision of elaborate tomb monuments and of church furniture gave much work to the German founder, the former largely in the nature of sculpture. Mention may be made of the seven-branch candlestick at Essen cathedral made for the abbess Matilda about the year 1000, and another at Brunswick completed in 1223; also of the remarkable font of the 13th century made for Hildesheim cathedral at the charge of Wilbernus, a canon of the cathedral. Other fonts are found at Brandenburg and Wurzburg. Of smaller objects such as ewers, holy-water vessels, reliquaries and candelabra, a vast number were produced. Most of the finest work of the 15th century was executed for the Church. The end of the Gothic period in Germany found the great craftsman, Peter Vischer of Nuremberg, and his sons, working on the bronze shrine to contain the reliquary of St. Sebald, a finely-conceived monument of architectural form, with rich details of ornament and figures; among the latter appearing the artist in his working dress. The shrine was completed and set up in the year 1516. This great craftsman executed other great works at Magdeburg, Römheld and Breslau. Reference should be made to the colossal monument at Innsbruck, the tomb of the emperor Maximilian I., with its 28 bronze statues of more than life size. Large fountains in which bronze was freely employed were set up, such as those at Munich and Augsburg. The tendency was to use this metal for large works of an architectural or sculptural nature; while at the same time smaller objects were produced for domestic purposes.

**Italy.**—By the 12th century the Italian craftsmen had developed a style of their own, as may be seen in the bronze doors of S. Zeno, Verona (which are made of hammered and not cast bronze), Ravello, Trani and Monreale. Bonnano da Pisa made a series of doors for the duomo of that city, one pair of which remains. The 14th century witnessed the birth of a great revival

in the working of bronze, which was destined to flourish for at least four centuries. Bronze was the metal beloved of the Italian craftsman; in that metal he produced objects for every conceivable purpose, great or small, from a door-knob to the mighty doors by Lorenzo Ghiberti at Florence, of which Michael Angelo remarked that they would stand well at the gates of Paradise. Niccolo, Giovanni and Andrea Pisano, Ghiberti, Brunelleschi, Donatello, Verrocchio, Cellini, Michael Angelo, Giovanni da Bologna—these and many others produced great works in bronze. Benedetto da Rovezzano came to England in 1524 to execute a tomb for Cardinal Wolsey, part of which, after many vicissitudes, is now in the crypt of St. Paul's cathedral. Pietro Torregiano of Florence executed the tomb of Henry VII. in Westminster Abbey. Alessandro Leopardi, at the beginning of the 16th century, completed the three admirable sockets for flag-staffs which still adorn the piazza of St. Mark's, Venice. A further development showed itself in the production of portrait medals in bronze, which reached a high degree of perfection and engaged the attention of many celebrated artists. Bronze plaquettes for the decoration of large objects exhibit a fine sense of design and composition. Of smaller objects, for church and domestic use, the number was legion. Among the former may be mentioned crucifixes, shrines, altar and paschal candlesticks, such as the elaborate examples at the Certosa, Pavia; for secular use, mortars, inkstands, candlesticks and a large number of splendid door-knockers and handles, all executed with consummate skill and perfection of finish. Work of this kind continued to be made throughout the 17th and 18th centuries.

**France.**—Wars and internal troubles must account for the disappearance of work in bronze; it is hardly likely that a nation with so many schools of fine craftsmen in the various metals could have failed to work in bronze. The great bronze seven-branched candlestick in Milan cathedral has a base and lower part decorated with intricately-designed ornament which is considered by many to be French work of the 13th century; the upper part with the branches was added in the second half of the 16th century. A portion of a foot of a similar object, showing the same intricate decoration, existed formerly at Reims, but was unfortunately destroyed during the World War.

In the 16th century the names of Germain Pilon and Jean Goujon are sufficient evidence of the ability to work in bronze. A great outburst of artistic energy is seen from the beginning of the 17th century, when works in ormolu or gilt bronze were produced in huge quantities. The craftsmanship is magnificent and of the highest quality, the designs at first refined and symmetrical; but later, under the influence of the rococo style, introduced in 1723, aiming only at gorgeous magnificence. It was all in keeping with the spirit of the age, and in their own sumptuous setting these fine candelabra, sconces, vases, clocks and rich mountings of furniture are entirely harmonious. The "ciseleur" and the "fondeur," such as Gouthière and Caffieri, associated themselves with the makers of fine furniture and of delicate Sevres porcelain, the result being extreme richness and handsome effect. The style was succeeded after the Revolution by a stiff, classical manner which, although having a charm of its own, lacks the life and freedom of earlier work. In London the styles may be studied in the Wallace collection, Manchester square, and at the Victoria and Albert museum, South Kensington; in New York at the Metropolitan museum.

**England.**—Casting in bronze reached high perfection in England, where a number of monuments yet remain. William Torel, goldsmith and citizen of London, made the bronze effigy of Henry III., and later that of Queen Eleanor for their tombs in Westminster Abbey; the effigy of Edward III. was probably the work of one of his pupils. No bronze fonts are found in English churches, but a number of processional crucifixes have survived from the 15th century, all following the same design and of crude execution. Sanctuary rings or knockers exist at Norwich, Gloucester and elsewhere; the most remarkable is that on the north door of the nave of Durham cathedral which has sufficient character of its own to differentiate it from its Continental brothers and to suggest a Northern origin. The Gloucester candlestick in the Victoria and Albert museum, South Kensington, displays the

power and imagination of the designer as well as an extraordinary manipulative skill on the part of the founder. According to an inscription on the object, this candlestick, which stands some 2ft. high and is made of an alloy allied to bronze, was made for Abbot Peter who ruled from 1109 to 1112. While the outline is carefully preserved, the ornament consists of a mass of figures of monsters, birds and men, mixed and intertwined to the verge of confusion. As a piece of casting it is a triumph of technical ability. For secular use the mortar was one of the commonest of objects in England as on the Continent; early examples of Gothic design are of great beauty. In later examples a mixture of styles is found in the bands of Gothic and Renaissance ornament, which are freely used in combination. Bronze ewers must have been common; of the more ornate kind two may be seen, one at South Kensington and a second at the British Museum. These are large vessels of about 2ft. in height, with shields of arms and inscriptions in bell-founders' lettering. Many objects for domestic use, such as mortars, skillets, etc., were produced in later centuries.

**Bells.**—In northern Europe, France, Germany, England and the Netherlands bell-founding has been an enormous industry since the early part of the Middle Ages. Unfortunately a large number of mediaeval bells have been melted down and recast, and in times of warfare many were seized to be cast into guns. Early bells are of graceful outline, and often have simple but well-designed ornaments and very decorative inscriptions; for the latter a separate stamp or die was used for each letter or for a short group of letters. In every country bell-founders were an important group of the community; in England a great many of their names are known and the special character of their work is recognizable. Old bells exist in the French cathedrals of Amiens, Beauvais, Chartres and elsewhere; in Germany at Erfurt, Cologne and Halberstadt. The bell-founding industry has continued all through the centuries, one of its later achievements being the casting of "Big Ben" at Westminster, in 1858, a bell of between 13 and 14 tons in weight.

In recent years bronze has to some extent replaced iron for railings, balconies and staircases, in connection with architecture; the style adopted is stiffly classical, which does not call for a very large amount of ornamentation, and the metal has the merit of pleasant appearance and considerable durability.

**Brass.**—Brass is an alloy composed of copper and zinc, usually for sheet metal, and casting in the proportion of seven parts of the former to three of the latter. Such a combination secures a good, brilliant colour. There are, however, varieties of tone ranging from a pale lemon colour to a deep golden brown, which depends upon a smaller or greater amount of zinc. In early times this metal seems to have been sparingly employed, but from the Middle Ages onward the industry in brass was a very important one, carried out on a vast scale and applied in widely different directions. The term "latten," which is frequently met with in old documents, is rather loosely employed, and is sometimes used for objects made of bronze; its true application is to the alloy we call brass. In Europe its use for artistic purposes centred largely in the region of the Meuse valley in south-east Belgium, together with north-eastern France, parts of Holland and the Rhenish provinces of which Cologne was the centre. As far back as the 11th century the inhabitants of the towns of Huy and Dinant are found working in this metal; zinc they found in their own country, while for copper they went to Cologne and Dortmund, and later to the mines of the Harz mountains. Much work was produced both by casting and repoussé, but it was in the former process that they excelled. Within a very short time the term "dinanderie" was coined to designate the work in brass which emanated from the foundries of Dinant and other towns in the neighbourhood. Their productions found their way to France, Spain, England and Germany. In London the Dinant merchants, encouraged by Edward III., established a "Hall" in 1329 which existed until the end of the 16th century; in France they traded at Rouen, Calais, Paris and elsewhere. The industry flourished for several centuries, but was weakened by quarrels with their rivals at the neighbouring town of Bouvignes; in 1466 the town was sacked and destroyed by Charles the Bold. The brass-founders

fled to Huy, Namur, Middelburg, Tournai and Bruges, where their work was continued. The earliest piece of work in brass from the Meuse district is the font at St. Bartholomew's church, Liège, a marvellous vessel resting on oxen, the outside of the bowl cast in high relief with groups of figures engaged in baptismal ceremonies; it was executed between 1113 and 1118 by Renier of Huy, the maker of a beautiful censer in the museum of Lille. From this time onward a long series of magnificent works were executed for churches and cathedrals in the form of fonts, lecterns, paschal and altar candlesticks, tabernacles and chandeliers; fonts of simple outline have rich covers frequently adorned with figure subjects; lecterns are usually surmounted by an eagle of conventional form, but sometimes by a pelican; a griffin surmounts the lectern at Andenne. The stands which support these birds are sometimes of rich Gothic tracery work, with figures, and rest upon lions; later forms show a shaft of cylindrical form, with mouldings at intervals, and splayed out to a wide base. A number are found in Germany in the Cologne district, which may be of local manufacture; some remain in Venice churches. About a score have been noted in English churches, as at Norwich, St. Albans, Croydon and elsewhere. For the most part they follow the same model, and were probably imported from Belgium; fine brass chandeliers exist, at the Temple church, Bristol, at St. Michael's Mount, Cornwall, and in North Wales. The lecterns must have set the fashion in England for this type of object; for several centuries they are found, as at St. George's chapel, Windsor, King's college chapel, Cambridge, St. Paul's cathedral and some London churches. In the region of Cologne much brass-work was produced and still remains in the churches; mention must be made of the handsome screen in the church of Xanten, the work, it is said, of a craftsman of Maestricht, Holland, at the beginning of the 16th century.

Holland, Norway and Sweden also produced chandeliers, many of great size: the 16th and 17th-century type is the well known "spider," large numbers of which were also made in England and still hang in many London and provincial churches. Holland also showed a great liking for hammered work, and produced a large number of lecterns, altar candlesticks and the like in that method. The large dishes embossed with Adam and Eve and similar subjects are probably of Dutch origin. These differ considerably from the brass dishes in which the central subject—the Annunciation, St. George, St. Christopher, the Agnus Dei, a mermaid or flowers—is surrounded by a band of letters, which frequently have no significance beyond that of ornamentation; the rims are stamped with a repeating pattern of small designs. This latter type of dish was probably the work of Nuremberg or Augsburg craftsmen, and it should be noticed that the whole of the ornament is produced by hammering into dies or by the use of stamps; they are purely mechanical pieces.

Brass was widely used for smaller objects in churches and for domestic use. Flemish and German pictures show candlesticks, holy-water stoups, reflectors, censers and vessels for washing the hands as used in churches. The inventories of Church goods in England made at the time of the Reformation disclose a very large number of objects in latten which were probably made in the country. In general use was an attractive vessel known as the aquamanile; this is a water-vessel usually in the form of a standing lion, with a spout projecting from his mouth; on the top of the head is an opening for filling the vessel, and a lizard-shaped handle joins the back of the head with the tail. Others are in the form of a horse or ram; a few are in the form of a human bust, and some represent a mounted warrior. They were produced from the 12th to the 15th century. Of domestic objects the number was legion: mortars, small candlesticks, warming pans, trivets, fenders; these date mainly from the 17th and 18th centuries, when brass ornamentation was also frequently applied to clock-dials, large and small. Two English developments during the 17th century call for special notice. The first was an attempt to use enamel with brass, a difficult matter, as brass is a bad medium for enamel. A number of objects exist in the form of fire-dogs, candlesticks, plaques and vases, the body of which is of brass roughly cast with a design in relief; the hollow spaces between the

#### VENETIAN BRONZE KNOCKER OF THE 16TH CENTURY

This bronze knocker, from the Palazzo Trevisan, Venice, has a design that occurs frequently, with variations, among Venetian palace knockers of the period. Neptune, brandishing his trident, stands upon two sea-horses. Their tails are thrown up behind him in elaborate foliation, while they paw the sea foam in the shell at the base of the knocker. The artist is unknown.

#### ENGLISH BRONZES

1. The sanctuary knocker on the north door of the nave of Durham cathedral, England (1133-40), probably the most ancient knocker extant. The design suggests Scandinavian origin.
2. An English aquamanile in the form of a standing lion. A spout projects from the mouth, and the opening for filling is on the top of the head. This type of vessel was commonly used with basin during the middle ages for handwashing at table.
3. 14th-century English flagon of cast bronze from a manor house in Norfolk. It is decorated with the old royal arms of England and an inscription in Gothic letters: "Goddess grace be to this place. Amen. Stand utter (stand away) from the fyre and lat onjust (let one just) come nere".
4. Round hammered brass dish of the 16th or 17th century. The centre scene, representing the Annunciation, is surrounded by a band of letters. The rim is stamped with a pattern of small designs.

lines of the design are filled in with patches of white, black, blue or red enamel, with very pleasing result. The nearest analogy is found in the small enamelled brass plaques and icons produced in Russia in the 17th and 18th centuries. The second use of brass is found in a group of locks of intricate mechanism, the cases of which are of brass cast in openwork with a delicate pattern of scrollwork and bird forms sometimes engraved. A further development shows solid brass cases covered with richly engraved designs. The Victoria and Albert museum, London, contains a fine group of these locks; others are *in situ* at Hampton Court Palace and in country mansions.

During the 18th century brass was largely used in the production of objects for domestic use; the manufacture of large hanging chandeliers also continued, together with wall-sconces and other lighting apparatus. In the latter half of the 19th century there came an increasing demand for ecclesiastical work in England; lecterns, alms dishes, processional crosses and altar furniture were made of brass; the designs were for the greater part adaptations of older work and without any great originality.

**Monumental Brasses.**—The working of memorial brasses is generally considered to have originated in north-western Germany, at least one centre being Cologne, where were manufactured the latten or "Cullen" plates for local use and for exportation. But it is certain that from mediaeval times there was an equal production in the towns of Belgium, when brass was the favoured metal for other purposes. Continental brasses were of rectangular sheets of metal on which the figure of the deceased was represented, up to life-size, by deeply incised lines, frequently filled with mastic or enamel-like substance; the background of the figures was covered with an architectural setting, or with ornament of foliage and figures, and an inscription. In England, possibly because the metal was less plentiful, the figures are usually accessories, being cut out of the metal and inserted in the matrices of stone or marble slabs which form part of the tomb; architectural canopies, inscriptions and shields of arms are affixed in the same way. Thus the stone or marble background takes the place of the decorated brass background of the Continental example. The early method of filling in the incisions has suggested some connection with the methods of the Limoges enamellers of the 13th century. The art was introduced into England from the Low Countries, and speedily attained a high degree of excellence. For many centuries it remained very popular, and a large number of brasses still remain to witness to a very beautiful department of artistic working.

The earliest existing brass is that of Bishop Ysowilpe at Verden, in Germany, which dates from 1231 and is on the model of an incised stone, as if by an artist accustomed to work in that material. In England the oldest example is at Stoke D'Abernon church, in Surrey, to the memory of Sir John D'Abernon, who died in 1277. Numerous brasses are to be found in Belgium, and some in France and Holland. Apart from their artistic attractiveness, these ornamental brasses are of the utmost value in faithfully depicting the costumes of the period, ecclesiastical, civil or military; they furnish also appropriate inscriptions in beautiful lettering.

### CHINESE BRONZE

**History.**—The bronze products of China have been from the earliest times of so high a degree of excellence, both artistic and technical, that they may truly be classed among the fine arts. So early as any reliance can be placed upon records the Chinese

appear to have been enthusiastic amateurs and collectors of bronzes, and up to the present day it is this very enthusiasm which has seemed to prevent a scientific attitude among Chinese antiquarians when the question of the dating of old bronzes is concerned. Many volumes have been written in Chinese and European languages, but the authoritative work has not as yet appeared. There are so many factors beside artistic merit which enter into the consideration of a bronze that facts have been collected and various theories advanced without arriving at any definite knowledge.

The bronzes in the Chinese collections may be divided roughly into two classes: (1) those whose surface has been worked over and (2) those which remain in the same condition as when they were first excavated. Those bronzes which have been for many years in famous Chinese collections have in most cases been worked over and vastly improved in appearance. Bronzes, as first excavated, should prove the most reliable documents, but scientific excavation is as yet hardly established in China, and it is difficult to ascertain the true facts concerning the finding of any piece which may come upon the market. Even though a perfectly reliable eye witness may testify to having been present at the excavation of a bronze, the chances are that he is not a trained archaeologist, and is unable to interpret correctly the conditions under which the bronze has been found. So far, we know of only one important excavation of bronzes which may be dated with any approximation of certainty. Remarkably fine specimens of bronzes exist in the collections of China, Korea, Japan, Europe and America, and the history of some of the pieces in the Chinese collections is known for several hundred years, for illustrated catalogues of bronzes were compiled during the Sung dynasty (A.D. 960–1279), and have come down to us together with later and more copious works, some in many volumes. They include: a famous work called the *Ting Lu*, written in the 6th century by Yu Li, and another in 20 volumes called the *San Li Tu* written in the 10th century by Nieh Tsung-yi. Both of these, however, have relied too much on imagination to be considered reliable. The most important early catalogue is in 30 volumes and dates from the Sung dynasty; its title is *Hsian Ho Po Ku T'ou Lu*, and it was written in the 12th century by Wang Pu; it has been often reprinted. The most famous of all the catalogues is one in 42 volumes, compiled for the Emperor Ch'ien Lung and printed in 1751. It illustrates his splendid collection of bronzes in the Peking palace and is called *Hsi Ch'ing Ku Chien*. There are many others of which a number are devoted to a discussion of inscriptions on bronzes.

Treatises on bronzes were written during the Chou dynasty (1122–255 B.C.) and from one of these we get our first information about their manufacture. Indeed, so great is the respect for ancient bronzes in China that in the year 116 B.C., when an old bronze *ting* was found in the bank of a river in Shensi, the name of the reign was changed in honour of the event. The reverential attitude of the Chinese towards antiquity, the permanent nature of the metal alloy, and the fact that the earliest important bronzes are all of a ceremonial or sacrificial nature have combined to place them high in the esteem of Chinese connoisseurs from the earliest times.

A Chinese collector will not hesitate to date an old bronze a full dynasty earlier than would a cautious European or American collector. Thus we are told that in many Chinese collections a considerable proportion of the bronzes were made in the Shang dynasty (1766–1122 B.C.) when such an attribution would seem to be based merely upon a pious hope. Since with some degree of certainty bronzes have been established as dating from the 5th century B.C., and are of accomplished workmanship, they are doubtless of more recent date than many others with which collectors are familiar, but there are few trained archaeologists outside China who will venture to state that any known bronze is definitely of the Shang dynasty. Within the next few years it may be possible, from dated excavations yet to be made, to determine the types of manufacture sufficiently to attribute bronzes to the early or the late Chou dynasty (1122–255 B.C.). That is, however, at present beyond the bounds of our knowledge. From

Han times (206 B.C.–A.D. 220) we are on a somewhat firmer footing, and the recent excavations of Kozlov, in Mongolia, have shed a great deal of light upon Han civilization enabling us to place in the Han dynasty, with some assurance, bronzes that would otherwise have received a much later dating. Dated bronzes of the Six dynasties (A.D. 265–589) and the T'ang dynasty (618–907) exist, but during the Sung dynasty (A.D. 960–1279) the taste for reproducing old bronzes arose, and the manufacture was carried on side by side with contemporary designs, so a state of confusion has resulted. It is highly probable that many of the so-called ancient bronzes are comparatively modern copies of the Sung period. In such pieces anachronisms are noticeable in the type and use of decorative motives rather than in the appearance of the objects as a whole. We know a good deal about the porcelain of the Ming dynasty (1368–1644), many pieces of which are dated, and a fairly good way of determining Ming bronzes is to compare them with Ming porcelains, which were often based upon bronze forms; some of them were undoubtedly copied from early bronzes, but anachronisms are bound to creep in. Except for deliberate forgeries, of which quantities exist, there is little danger of confusing a modern bronze with an ancient one, for little of the exquisite technique of the early bronze founders has survived. This is due rather to cheapness of production and careless slipshod methods, than to any loss of knowledge of the processes.

**Bronze Composition and Manufacture.**—Bronze was used at a very early date for both ceremonial and utilitarian purposes and doubtless the ceremonial use was the later development. It must first have been cast in single stone moulds, then in piece moulds, and finally by the lost wax process, to which complicated method we owe the earliest bronzes now known to us. The simple piece moulds were used for coins, spear-heads, halberds, swords, and such objects, where the forms were simple and flat. Large basins were also cast by this method and Voretzsch believes that it is often possible to tell from examining the surface of a bronze how many pieces had previously been cast in the same mould.<sup>1</sup> The ceremonial vessels varied greatly in form, some being very complicated, with elaborately modelled handles and surface decoration in several different planes. While the earliest of these are cast by the lost wax process, and are technically superb, it is interesting to note that from the Han dynasty onwards we find an increasing number of bronzes whose component parts were separately cast and afterwards assembled by welding. So proficient were the workers in the craft of bronze founding, that bronzes of the good periods seem to have come from the mould so cleanly and sharply defined that very little work was necessary to finish them with chisel and file. The fact that a bronze was cast in one piece does not necessarily indicate that it is old, but a bronze cast in several parts and welded together could hardly antedate the Christian era, and would probably be of much later date.

There have been several series of experiments conducted to determine the composition of early bronzes. One of the most complete has recently been published by Prof. M. Chikashigé, a Japanese, who analysed chemically and physically a number of mirrors. It has been stated in a work pertaining to the Chou dynasty, but possibly of later date, the K'ao Kung Chi, that the proportions of copper and tin were definitely established for the making of bronzes for specific purposes. It is certain, however, that neither these metals nor any others were available to the Chinese in a form at all pure, so in all the alloys there are other metals present such as lead, zinc, antimony, iron and silver. Some of the early bronzes have a beautiful golden colour under the patina, and there are dealers who have not hesitated to state that this was due to the presence of large quantities of gold in the alloy. Chemical analyses show no gold.

The proportions used in the Chou dynasty, according to the K'ao Kung Chi, are as follows:

|  |
|--|
| 5 parts copper, 1 part tin for bells, gongs, kettles, ceremonial vessels and measures of capacity. |
| 4 " " 1 " " " axes and hatchets.   |
| 3 " " 1 " " " halberd-heads and tridents.  |
| 2 " " 1 " " " two-edged swords, spades, hoes and similar agricultural implements.                  |

<sup>1</sup>Voretzsch, *Altchinesische Bronzen*, pp. 35, 39 (1924).

3 parts copper, 2 parts tin for arrowpoints and knives used as styluses for writing.

1 part copper, 1 part tin for mirrors.

The varying proportions of metals in the alloy would of course affect the colour, and we have, in consequence, a range from a coppery red colour through lighter reds and golden yellow to the nearly pure silver colour of the mirrors. The surface of most ancient bronzes, when cleaned from deposits and patina, has a dull silvery colour due to mercury. This is said by some to be the result of the accidental presence of mercury in the alloy, which has worked to the surface during long years of burial. It is more probable, however, that the mercury was used deliberately to coat the surface of the bronze and thereby produce a silver-coloured plating in cases where the alloy itself was not white. The colours produced by age and careful manipulation, now so highly valued, were of no interest to the Chinese of early ages who preferred the bronzes to be of a steely colour.

**Forms and Uses.**—The uses of the bronze ceremonial vessels are largely conjectural. Our information is gained from works based upon the researches of the archaeologists of the Sung dynasty, who undoubtedly had material not available to us, but whose deductions and theories would hardly be called scientific. It is believed that the sacrificial forms were based upon idealizations of vessels in common use; that some held liquids such as wine and water, and others, cereals and prepared meats. Some of them may have been used only for commemorative purposes. A man raised to high rank would cause a bronze vessel to be made in honour of the occasion, and would inscribe it, sometimes to his ancestors, to whom he believed his preferment was due, sometimes to himself. It is not known whether or not such vessels were used in family sacrifices or religious ceremonies. Since Shang bronzes are still problematic it may be well to consider briefly the forms of ceremonial bronzes most widely used during the Chou dynasty.

All Chou bronzes can be characterized as dignified and massive in proportion. Whether they be large or small there is always an appearance of strength and solidity; and although not essentially clumsy, there is as yet little charm of contour such as would have been so essential to the Greeks. The few exceptions are in the profiles of some of the simpler *tsum*, and these are as sensitive in line as any works of art that have ever been made. So keenly was the line felt in such instances that the slenderness or sturdiness of the *tsum* was perfectly expressed in the quality of the profile, regardless of bulk. There is crudity perhaps in the conception of some of the decorative motives, but it is the crudeness of conception of the Romanesque period, without any traces of its awkwardness of execution.

Chief among early bronze forms is the *ting* (鼎). Originally a tripod cooking pot, it assumed a great variety of shapes, some clumsy and topheavy, and others refined, but always sturdy. There is at present in the Buckingham collection in the Art Institute of Chicago, an unusually fine example of an early but refined type. It was formerly in the Tuan Fang collection. The patina is a beautiful tea-dust green, and has evidently been hand-polished for generations.

The *hsien* (簋) is generally a three-legged vessel the bottom section of which is covered by a perforated and sometimes hinged lid; it was a steamer often made in two parts, occasionally separable, and is really an archaic version of a cooking utensil well known in Chinese kitchens. It is always clumsy in form, as compared with other bronze forms, which may be another indication of its early origin.

The *yu* (缶) is a covered bucket-like utensil with a swinging bale. It has a bulbous body, always elliptical in section, and the cover fits closely down over the neck. In some cases the swinging handle is so arranged that it moves through a limited distance, allowing only sufficient room for the easy removal of the lid. The function of the *yu* was the storage and transportation of sacrificial wine, or possibly of wine for less solemn occasions.

The *tsum* (尊) which, in its simplest form, is a cylinderlike beaker with concave sides, goes through a variety of changes in form without change of name. Some of the most beautiful of all

### CHINESE BRONZE INCENSE BURNER

Chinese bronze incense burner of the Sung dynasty (A.D. 960-1280) in the form of a water buffalo upon which is riding Lao-tse, the philosopher who founded the Taoist religion. The water buffalo, being one of the most dangerous and difficult beasts to tame, is chosen as a symbol of the power of the gentle thought of the philosopher. The casting of this piece is paper-thin

the ancient bronzes are *tsun*. These beakers were used to contain liquids.

The *yi* (彝) is a wide cup, generally with two handles, though some handsome variants are known with four. The handles are sturdy, with animal heads at the top and a rectangular pendant at the bottom. This form must originally have had significance, but its origin is lost. A few specimens have been found mounted upon a square hollow base, cast all in one piece, from under the top of which depends a loop. Some Chinese archaeologists claim that a bell originally hung from this loop, which rang when the *yi* was lifted. Although the bell is of very ancient origin in China it was without a clapper for some centuries after the *yi* in question were made, so it seems hardly possible that a voiceless bell should have hung there. Bells were struck with a wooden mallet on the outer surface, and a person who held a heavy *yi* aloft in both hands could certainly not have struck a bell hanging beneath. The use of the loop remains therefore still problematical, and would not have been mentioned here were it not that it furnishes an excellent example of the fantastic speculations which have passed current in China as archaeology. The *yi* was used for offerings of grain.

Another form called *yi*, but differently written (匜), is sometimes the most fantastic of all the sacrificial vessels. These *yi* are often animal forms conventionalized into containers for sacrificial wine, and generally of a deliberately ugly or menacing aspect. The animals are usually not recognizable as members of any known species, but are extremely convincing, nevertheless.

A form called the *hu* (壺) became very popular during the Han dynasty. It is a round-bellied jar with a spreading cylindrical neck, and a cylindrical foot. It has two ring handles suspended from flat tiger masks on the shoulders, and was used as a container for wine or water. Three of the finest of these examples are in the Buckingham collection. One bears engraved upon the neck four characters reading "Number seven eastern palace." Another of these jars approximately the same size and shape has the entire surface covered with an engraved pattern consisting of geometrical ornament and dragon-headed interlacing scroll patterns. Both these jars are of reddish bronze with a heavy gold plating, but the decorated jar has the pattern relieved in silver colour evidently obtained by painting the gold surface with mercury. The masks which support the handles of this jar are very crisply chiselled, and there can be little doubt that it is an imperial piece. The third of these jars is inlaid with a metal now much decomposed, but probably copper. A pattern of sprightly animals, facing each other in pairs, and in different registers, alternating with spirals gives vigorous decoration over the entire surface. The form of the jar is extremely simple, but it is saved from monotony and raised to a high degree of beauty by the unusual vitality of the decorating shapes.

Bells and mirrors deserve special mention. Fine bronze bells of the early periods have long been highly esteemed by Chinese collectors, particularly when they bear inscriptions, and an inscribed bell was always considered superior to an uninscribed one of greater artistic merit. The forms of early bells are all more or less alike, and they may be generally considered as representing one class, although there is a great variety in proportion and in the surface decoration. Most of the bells have projecting bosses, sometimes called nipples, arranged in regular pattern on the surface, and these have given rise to some amazing speculations among Chinese amateurs. Perhaps the most amusing is that they are the survival of tuning pegs, such as are used at present in harps and pianos. It is claimed that strings or wires were stretched between them and that the bells were tuned to various musical pitches. A simpler solution of the problem would be that they represent rivets which in early times fastened plates of metal together in bell forms before bronze could be easily cast. The bells are all flat in section, like pointed ellipses, and this form could easily develop from metal plates.

Mirrors were probably introduced from the West, as highly artistic metal mirrors were in use in Greece some time before they seem to have appeared in China and crude earlier Scythian examples are known. With one or two possible exceptions the

earliest Chinese mirrors we know date from the Han dynasty. The earliest examples are circular and very simple. The reflecting surface is as a rule slightly convex, and the back is decorated with concentric bands of geometrical patterns. Ritualistic mirrors sometimes had concave reflecting surfaces. Sometimes there are birds or beasts in raised outline, and sometimes characters and signs of the zodiac in the field inside the bands. A boss in the exact centre, pierced from side to side, allowed the passage of a cord which was twisted into a tassel and used as a handle for the mirror. Some of the finest mirrors date from the T'ang dynasty. The backs are covered in high relief with intertwining patterns of vines, leaves, birds and running animals, and are reminiscent of Persian taste as well as the repoussé silver work done in Asia Minor from Hellenistic times. Caravans were passing continually between China and the West, and, from the time of the Han dynasty, outside influences become a distinct factor in the development of all the crafts of China.

Much has been said about the style of the Ch'in dynasty, a period of less than 50 years between the Chou and the Han, filled with uproar and confusion. There is little doubt that many practices of the Chou dynasty came to a rather abrupt end, but styles do not end with one dynasty nor begin with another, and it is doubtful if such a thing actually exists as a Ch'in style. The use of bronze became more widespread among the people during the Han dynasty, and from that time its uses multiply. There are splendid representations of animals, generally on a very small scale, singly, and in fantastic groupings. These occur from Han to T'ang.

During the Six dynasties it became the custom to cast votive figures in gilt bronze, and the monasteries seem to have made a practice of keeping large numbers of these on hand, ready for dedication by the pious. It is from the inscriptions engraved on the bases at the time of such dedications that we have gained much of our information on sculptural characteristics and religious practices of the Wei and T'ang dynasties.

From the end of the Chou period there is a tendency to simplify bronze forms and rely upon engraved or inlaid patterns in place of the early decorations in relief. During the Sung dynasty the keen delight in archaeological research prompted the manufacture of exact counterparts of early forms, as well as all sorts of archaistic approximations. Very few Ming bronzes have much to recommend them as works of art. They are generally the products of the virtuosity of mediocre craftsmen, produced at a time when lavish decoration had taken the place of purity of form.

**Inscriptions.**—In the identification of ancient bronzes the Chinese lay great stress upon inscriptions. There is still some doubt as to the meaning of certain of the ancient characters, but most of the inscriptions can be read. They vary in length from one character to several hundred, and often give accounts of historical events and the names of personages, but without dates, and without sufficient detail to make attributions to definite times or places anything more than conjectural. One of the longest on record is in the South Kensington museum, London. The shorter inscriptions read: "To the venerable father," "I have dedicated this bronze to my father Ting," "Serviceable for sons and grandsons," etc. There are also single marks, more or less pictographic, some of which represent animals, birds or men. The meaning of others is not at all clear.

As bronzes with inscriptions bring higher prices, many dealers have felt it their duty to see that all bronzes in their possession bore the right, or wrong type of inscription. Many bronzes, perfectly genuine, excellent specimens artistically, have had inscriptions added at a later date, in characters sometimes meaningless. In the ancient bronzes the inscriptions were cast in the surface like the ornament, and it is practically impossible to imitate a cast inscription by means of engraved characters, so a microscope, and even the eye alone will detect the added inscription. This is not, however, a practice of recent origin, and some very fine bronzes of the Chou dynasty bear inscriptions in Shang or Chou characters which were added to them several hundred years later.

#### EARLY CHINESE BRONZES

**Decoration.**—The religion of the Shang and Chou dynasties was animistic, and the decorations on the early bronzes have been interpreted as representations of the forces of nature, sometimes in demoniac form. Almost all decorations consist of two parts, an arrangement of forms of animistic or zoömorphie origin in rather high relief, strongly modelled, and a pattern of thin lines, closely spaced, in sharp relief, either outlining the stronger forms, or in an all-over pattern of spirals, completely filling the ground. These lines are extraordinarily crisp in execution, and unvarying in thickness throughout the pattern, and were carved in the surface of the original model, from which they were cast in the bronze. Later bronzes often have patterns of this type applied by means of stamps to the mould, with the result that the character is entirely different, the crispness of execution being totally lacking, and the relief much shallower. These line motives are of the well-known and wide-spread key or fret design and are generally known as the "thunder" pattern. Very delicate single lines in relief, often form bands around *tsun*, *yu*, and other vessels. They are extremely regular, but careful inspection will detect slight variations in direction, showing that they were not mechanically done. The Chinese call them "bowstrings." Other linear motives are found of intersecting lozenge or diamond patterns on the handles of vessels.

Of the non-geometrical decorative forms of the Chou dynasty the T'ao-t'ieh, or ogre's head is the favourite. Often it is represented only by a pair of eyes—hemispherical bosses with an incised centre. Sometimes the upper part of a face is indicated, but the lower jaw is never shown, so it appears, even in its most complete form, as a sort of mask. It is abstract, but nevertheless there is something intense about it which has an awe-inspiring effect even upon the uninitiated. In late Chou bronzes, zoömorphie forms are sometimes arranged in opposition so as to form parts of a T'ao-t'ieh. In spite of many and ingenious theories it is

still uncertain what the T'ao-t'ieh represents, but his representation is always easily identified.

Animal heads are often used as ornamental bosses in the centre of a band of decoration, and as handle ends on the swinging bales of the *yu*. Some of the heads are horned and some are not. Some have spreading mouselike ears. They are variously identified, but none of them seem closely patterned after nature. They are abstractions based upon animals rather than animal portraits.

In considering the decorative zoömorphie motives on Chou bronzes and those of similar design it might be safe to say that a recognizable animal always argues a comparatively late date. We can see bird-like, and animal-like forms, and even very close likenesses of the cicada, which lends itself easily to geometrical conventionalization, but as soon as elephants, or other recognizable animals appear we realize that the piece is later in date or even archaistic.

Very noticeable as decorative forms are the projecting flanges on the corners of square bronzes, or dividing the surface of the round bronzes into vertical panels. It is one of the favourite motives of the Chou dynasty. As will be noticed in the illustrations they are usually cut and perforated into decorative forms. In some cases they are so fantastic as to detract from the beauty of the piece.

One sees no reason to doubt that their origin was the projecting "fins" which are always left in castings from piece moulds, and that long after the piece moulds had ceased to be used for fine bronzes, the decorative descendants of their "fins" were cast, as ornamental motives.

In the Han dynasty, and later, there is a great deal of inlaying in gold lines of the most elaborate patterns. Evidently a new flood of folk-lore from outside sources was pouring over China at that time, and all sorts of animals and warlocks chase each

#### INDIAN METALWORK OF THE 6TH TO THE 19TH CENTURY

1. Tinned copper ware from Kashmir. 18th and 19th century. 2. Gilt copper relief representing a *kinnari*, from the temple at Srisailam. 3. Silver inlaid copper box (*killotaya*) for chewing-lime. Ceylon, 18th century. 4. Three brass *surahis* for carrying Ganges water, 18th-19th century. 5. Brass vessels from Kashmir showing Persian influence. 6. Copper lamp. South India, about 17th century. At the back, seated,

Gaja-Laksmi, framed by a *makara-torana*. 7. Bronze-coated iron plummet from Bengal, 6th century. 8. Copper ewer (*kendiya*) engraved and set with gems. Ceylon, 18th century. 9. Two temple hand lamps of brass from Travancore, early 19th century. All of these objects are of various alloys, ranging from copper and brass to bronze

other through mountains and clouds. There was then a breaking away from the heavy and sombre traditions of the Chou dynasty and a tremendous expression of energy. Many of these inlaid gold bronzes have recently come to light and have been ably discussed by Rostovtzeff in his book "Inlaid Bronzes of the Han Dynasty." The animals or spirits, or whatever the forms represent, were in most cases animals not seen or known—heard of perhaps in wild tales of barbarian tribes, or copied from foreign animal motives imperfectly understood; imagined, or evolved as personifications of the forces of nature.

During the Han dynasty the tale of the Kun-lung mountains with their peachtree on which grew the peaches of longevity was popular, and the "hill" type of incense burner came into being. Though prevalent in Han pottery, in bronze it is hardly met before the Six dynasties, and then, although the conical cover moulded to resemble mountain peaks hardly changed its shape, the cylindrical base most common in pottery was replaced by forms of greater fancy and grace. Coiling dragons of strength and vigour often supported the censer in their jaws.

Dragons were not very common as bronze decorations before the Han dynasty. It has been proved that they were a comparatively late importation from the west, but from T'ang times onwards they are the commonest of all decorative motives. Taoist figures become popular in Sung and Ming times, such as Lao Tzu, riding upon an ox and in the following centuries bronze has been the medium for comparatively trivial ideas. The majesty of the early days is gone forever. A conspicuous exception, however, is the set of large bronze astronomical instruments cast in 1279 for the observatory on the walls of Peking. The Ming emperors sought dignity on an enormous scale, and huge bronze vessels and dragons were cast for use in the palace and the palace grounds, but few of them were successful and most were extremely awkward and ungainly.

The walls of early bronze vessels, except for the basin-like ones, are generally thick, and the walls of later bronzes are always comparatively thin. The early bronzes show a tenseness of conception, the later ones a suavity of line and simplicity of mass that tends to become insipid. All the handles and other freestanding parts of early bronzes seem so perfectly suited to their function and the needs of the design that they appear inevitable. The handles on Ming and Ching bronze jars are frequently monstrosities, violating all design canons. The decoration on early bronzes seems always produced with the particular piece in mind, but in the later bronzes it is simply a matter of stock patterns applied with dies and stamps.

**Patina.**—Inasmuch as an interesting patina will to-day bring a high price for a bronze of little or no artistic merit some discussion of patinas may be useful here. True patination is produced by chemical changes brought about by the action on the bronze of chemicals in the soil in which it is buried, hastened more or less by the amount of moisture present. Some bronzes have been found in water, which produces a distinctive effect, and some are thought never to have been buried. Europeans and Americans prefer a green patina, and the Chinese consider that a velvety black is the best. Good patinas are very appealing in colour and texture, particularly if they have received careful grinding and polishing for generations, so it is not surprising to find bronzes in many museums which have absolutely no merit beyond the accidental one of colour. When a bronze is excavated its surface is naturally covered with dirt and incrustations more or less thick, underneath which is the patina caused by the disintegration of the metal surface and its combination with elements which surround it. If the patina is thick and its colour good it may be carefully ground down and polished away until the resultant bronze is actually the handiwork of a more recent craftsman who has carved out of the heavy patinated surface the original form of the bronze. The favourite Chinese method is to polish with the bare hand, relying on the oils of the skin for the sole lubrication. Generations of such polishing by hosts of patient servants has given to many famous bronzes their charm of colour. At the present time many bronzes are coming on the market just as they have been excavated, and there is an evident attempt to preserve

all dirt which can be made to cling to the surface. Many European collectors wax and polish the surfaces of their bronzes, but the practice is not followed in America.

Unscrupulous dealers have not hesitated to apply artificial patinas to genuine old bronzes to increase their saleability, and this is done in a variety of ways. The simplest method is to paint them. Watercolour paints will wash off in water, and turpentine or naphtha will act as a solvent to oil colours, so these methods of falsification are easily detected. Sodium silicate, which is very slow to dissolve, is often used and in Japan exceedingly clever work is done with coloured lacquers. Waxes are used also. There is, unfortunately, no way to be absolutely certain that a bronze is genuine, but there are many ways of finding out when they are not genuine. A true patina is not easily damaged. Boiling a few hours in water, and washing with paint and varnish solvents will easily remove the more recent traces of antiquity. The lacquer does not come off so easily, but where lacquer, or a silicate, has been applied, the surface beneath is generally roughened so that if a small bit of the surface is exposed, the artificial roughening can be seen. The true patina has actually eaten into the surface and cannot in most cases be easily removed. Where the process of patination has gone far the entire bronze shell is sometimes changed in composition, and if genuine fragments of ancient bronzes are examined it will be seen that the patina penetrates deep below the surface, sometimes leaving only a slight core of the original bronze which, too, has changed in composition, if not in colour, and has become extremely brittle. On the other hand under different conditions the strength, the toughness and even the appearance of old bronzes have been little affected. Some very careful forgeries have been made by applying fragments of true malachite to the surface of the bronze with lacquer. Some types of bronze patina are actually like malachite in structure, appearance, and chemical composition, but forgeries of this type may be detected under the magnifying glass by observing the stratifications of the colour layers which will not harmonize with each other.

## INDIAN AND INDONESIAN

**Copper, Brass and Bronze.**—The founding of copper, brass and bronze by the *cire perdue* process is universal in India, and of high antiquity; but it may be remarked that the use of bronze is comparatively rare in the case of images, most of the so-called Indian bronzes being made of pure copper. After finishing, the casting is usually gilded by the mercury process. In the case of Nepalese copper figures, and occasionally in Jaina brass figures, a decoration with inlaid gems may be added. Small images are cast solid; much larger images were cast by the same process, but on an earthy core composed of clay, sand, charcoal and rice-husks, burnt to a cinder-like consistency. The colossal copper Buddha from Sultāngāñj, of Gupta date, now in the Birmingham museum and art gallery, was cast in this manner, but in several sections; the same process is widely employed in Farther India, and is especially characteristic of the later Siamese "bronzes."

In the case of utensils such as water-vessels and ceremonial vases, lamps, etc., the same process is employed, but the casting is finished by turning on a lathe and polishing. Vessels of copper, brass or bell-metal were formerly made exclusively for domestic and religious use, but more highly ornamented types are now made largely for sale to tourists, in Benares, Madras and Ceylon. Amongst the standard forms may be mentioned water-vessels for

hand use (*loṭā*), those with long necks (*surāhi*) used for carrying Ganges water to great distances for ritual purposes, and the vessels for specifically religious use in worship, such as the *arghya-patra* for consecrated water. Spouted vessels are used for drinking water, not from the spout by direct contact, but as a continuous stream poured directly into the throat (see DRINKING VESSELS). A special form of vessel formerly in use by Brahmanical and Buddhist ascetics was the *kamandalu* or *kundikā*, usually of earthenware, but sometimes of bronze, in which the long neck formed the true spout, and a lateral opening served for filling; this form passed with Buddhism to China and Korea.

The *cire perdue* process is also employed in the making of peasant jewellery in base metal. A very interesting variety of this technique is practised at Būndi in Rajputana, where the flexible anklets called *sānt* are cast in one piece. A composition of wax, resin and oil is prepared in a long string, which is then twisted spirally round a stick of the diameter of the intended links; one cut along the stick separates the links, which are then interlaced every one into two others, and joined up by the application of a hot knife. When 60 or 70 rings have been thus united, the ends of the chain are joined, and the whole gently manipulated until it forms a perfectly flexible model of the future anklet. This is then dipped into a paste of clay and cowdung, and finally enclosed in an outer layer of clay. When dry the mould thus prepared is scraped until a small piece of each link is just visible, then a wax leading line is attached all round, and the whole again covered with clay. Two such moulds being placed side by side, the wax leading lines are led into a hollow at the top of the mould; this hollow cup is filled with metal and borax, and covered with clay, leaving only a blow-hole. The whole is then placed in the furnace, the wax melts, and the metal takes its place. When the mould is opened it is only necessary to remove the leading lines and file down irregularities, to have a pair of flexible anklets ready for use. Small images and toys are often made in a similar fashion from prepared wax, all the ornament being applied in the shape of the wax string; brassware similarly decorated always retains an appliqué effect in the finished product.

Some of the finest examples of Indian metal-work are afforded by temple bells, and standing and hanging lamps and lamp-chains. The bells range from those used in the hand to the great bell cast for King Bawdawpaya in Burma in 1790, the second largest in the world, and weighing over 80 tons. Lamps for burning oil are cupped for one or more wicks; those made in candelabra form, like a tree of which the branches bear innumerable lights, are especially beautiful.

Brass or copper vessels may be decorated by chased or engraved ornament or by inlay or encrustation of some other metal, according to the method already described in the case of iron. Brass inlaid with silver and copper is often very effective. Silver is applied to copper with specially good effect in the case of the *huqqa* covers of Purnea, Bengal. More rarely a copper vessel may be decorated with inset gems, like goldsmith's work. The characteristic brass ware of Morādābād, still extensively produced, is engraved with minute designs, relieved against a background of coloured lac, which is filled into the excavated ground by means of heat; in some of the best examples the ground colour is all black, producing a sort of imitation *bidri*, in others red and green are also used. True enamel seems to be applied only to gold and silver, niello (*q.v.*) only to silver. The excellent tinned copper ware of Kashmir and the Punjab is mainly used by Mohammedans for domestic purposes, and is of Persian origin.

**Bidri.**—One of the most distinctive of Indian metal wares is that known as *bidri*, from the chief and, perhaps, original place of manufacture at Bidar in Hyderābād. Another main source of production, both in the 18th century and at the present day, is Lucknow. The objects made are for domestic use (Pl. xvii, figs. 1, 2, 3). The alloy is composed mainly of tin or zinc, with smaller proportions of lead and copper. After casting, and shaping on the lathe, the surface is then engraved for the application of silver inlay; finally the surface is polished and darkened by the application of a sal ammoniac and saltpetre paste mixed with oil. The designs are geometrical and floral and in the best taste (except in some

modern examples, where the effect is too thin), standing out brightly in silver on the dead black ground colour of the alloy (See also ARMS AND ARMOUR; COPPER; CIRE PERDUE; SILVER-SMITH'S AND GOLDSMITH'S WORK; PEWTER; MEDALS AND COINS).

### CORROSION AND RESTORATION

The art of fabricating metal objects such as spearheads, daggers, urns, vases, statues, bracelets, etc., dates back many thousands of years. There are on exhibit to-day in all of the important museums of the world many precious specimens, often of rare beauty of design, that bear witness to the highly developed skill of the ancient metal workers and artists of Egypt, Greece, Etruria and other countries. These metal objects when unearthed to-day are at times in a very well-preserved condition. This applies, for example, to most of the bronze, silver and other metal articles found in the tomb of Tutankhamen. This tomb may be looked upon as an "ideal location" in view of the fact that corroding influences such as moisture, salts and acids were practically absent throughout the countless days of seclusion. On the other hand, there have been many old graves uncovered in which the metal implements and jewellery were found to be completely disintegrated, no vestige of the original metal or alloy remaining. The corroding agents, ever present in most soils, had converted the copper, tin, iron and lead back into mineral compounds such as oxides, chlorides and carbonates.

Between these two limits—complete preservation and complete disintegration—there are many intermediate stages. Very often a statue or a coin reveals upon examination a distinct metal core, the outer incrustation being composed of minerals formed from the original metal or metals. The process of restoration, briefly outlined below, and discovered and developed a few years ago (C. G. Fink and C. H. Eldridge, *Report, Metropolitan Museum of Art*, New York, 1925), applies in particular to art objects of bronze and of other alloys which have suffered partial or complete disintegration while being buried or being otherwise exposed to corroding influences.

**The Process of Corrosion.**—It is now conceded by most authorities that the process of corrosion of a metal or an alloy is due to electro-chemical action. One or many "cells" are formed between the more noble or "positive" areas or components, and the less noble or "negative" areas of the metal. Very often there is a distinct plating out of pure silver due to disintegration of silver-copper alloys. In the case of the bronzes the products of corrosion are the oxides of tin and copper besides the pretty green (malachite) and blue (azurite) basic carbonates of copper. At times chlorides and sulphur compounds of copper are likewise present. Silver, when not alloyed, is found either as metal or as ebony-black sulphide. Gold almost invariably occurs as metal, either pure or alloyed with copper or silver.

Certain salts such as chlorides, sulphates and nitrates present in rain and in moist soil greatly hasten the process of corrosion. There are, however, other active agents, for example, acids and

#### INDIAN METALWORK OF THE 10TH TO THE 19TH CENTURY

1. 17th century shrine from Darjeeling. Finials and feet are cast, the rest is repoussé, with pierced work in the canopy. The surface is covered with a green patina, probably due to weather rather than burial
2. Brass lamp, heavily cast and chased. Nepal, 18th-19th century
3. Brass shrine from Jaina, 14th-15th century

4. Javanese copper bell of the 10th century
5. Carved steel elephant goad (*ankusa*) from Tanjore, 17th century
6. Copper sacrificial spoon. Cambodian, about the 10th century

All of these objects are of various alloys ranging from copper and brass to bronze

salts of organic origin, notably carbonic acid, which serve as electrolytes and tend to hasten the decomposition of the metal or alloy.

Of prime importance in this process of corrosion is the presence of water or moisture. In completely dry locations corrosion does not occur. Water, present merely as moisture in the soil in which the bronze lies buried, is sufficient to bring about mineralization of the surface of the bronze and eventually of its entire body.

The author's examination of the cross-section of a number of metal objects which were in the last stages of complete mineralization revealed some interesting facts: The cross-section of a Greek bronze bracelet showed a small residual metallic core, around this a  $\frac{1}{8}$  in. thick layer of copper oxide (cuprite) and stannite and outside of this a layer of green basic carbonate of copper (malachite). The cross-section of another bracelet showed a metallic core composed primarily of copper and silver, then but a short space from the surface of this core, a ring of pure silver and then beyond this a layer of malachite.

It might be well to recall at this point that of the various copper minerals occurring in the earth's crust, malachite is one of the most stable, in particular, under those conditions of the atmosphere and the soil of the localities in which the human race has lived and prospered. Malachite is a decomposition product of other less stable copper minerals such as the sulphide, chalcocite, or the chloride, atacamite, or the sulphate, brochantite. During the process of corrosion of a bronze there are, as a rule, undoubtedly unstable compounds of copper first formed which are eventually transformed into the basic carbonate or malachite.

**The Older Processes of Restoration.**—In the past, metal objects of art had been found in dry locations, in a good state of preservation, and these needed very little preparation or cleaning before being submitted to museums or collections. On the other hand, when the metal article was covered with an earthy crust of appreciable thickness—and usually unsightly in appearance—various "radical" measures were resorted to by dealers and others. Old bronzes showed fresh chisel marks, indicating plainly that the method of removing the crust or hard outer layers was of a very crude mechanical sort. Other "restored" bronzes showed all the pit marks of strong acid cleaning. Those who have resorted to these radical chisel or acid methods of "restoration" in the past overlooked one very important fact—a fact which was only brought to light a few years ago in the course of our own researches. The fact is this: *During the process of corrosion of an art bronze the detail of design is "held" or "preserved" in the crust but not on the surface of the metal core.* The core of a badly corroded bronze is almost invariably deeply pitted and ugly in appearance.

**The New Process of Restoration.**—Conceding that the corrosion of metals and alloys was an electrolytic one, it was evident that if this electrolytic process of corrosion could be reversed, a method might be devised whereby the metal compounds in the crust would be reduced back to metal. After a series of experiments, expectations were fully realized, and this record, with the illustrations herewith, is the restoration process as finally worked out by the writer.

Without any preliminary cleaning, the corroded bronze object to be restored is hung as a cathode in a 2% caustic soda solution (room temperature) and low amperage direct current applied. The object is suspended with soft copper wires and is completely immersed in the solution. When there is danger that the object might not hold together during the process of reduction or restoration, it is advisable to pack the whole object in clean white sand, after making proper electrical connections, and then filling the containers with the caustic soda solution. Two or more anodes are hung up near the edge of the container. Iron, duriron and platinum anodes have been used with success. A rectangular glass battery jar of one litre capacity serves well as a container for the treatment of small bronzes. For large objects, stoneware tanks may be employed and there is no objection to the use of large sheet-iron tanks welded at the joints. A very low current density is essential. In general, the more completely mineralized the object, the lower should be the current density. From one

to five amperes per square foot of exposed cathode crust surface is usually suitable, but even lower current densities are to be resorted to when the gassing at the cathode is too vigorous. It must be understood that violent gassing will cause serious injury to a soft crust, especially during the first stages of reduction. Upon first closing the electrical circuit it often happens that no appreciable current passes through the cell, due to the poor contact between the copper wire and the crust. However, this is only a temporary phenomenon and after a short time the entire crust becomes conducting. An important requisite for success is the allowance of ample time. The heavier the crust the longer the time. Bronzes with crusts of  $\frac{1}{8}$  to  $\frac{1}{2}$  in. in thickness usually require three to six months continuous electrolytic treatment. The metal compounds in the crust are slowly reduced back to metal and after further electrolysis the finely divided metal becomes more and more compact. Very often it is not essential to proceed to this very last stage. By careful handling and drying the finely divided metal can be conveniently compacted by means of a good grade of shellac. This latter procedure is particularly useful where detail of design is of first importance and where the object treated will be kept in a glass case. Silver alloy objects which have been badly decomposed while buried in the soil usually contain a layer of pure silver within the crust, as mentioned above. Now it is a very fortunate circumstance that the details of design of the original silver-alloy bracelet or other article are faithfully reproduced in this layer of pure silver, the product of the de-cuprification of the alloy. Accordingly, when restoring articles of this alloy by the electrolytic method, we reduce the malachite and other copper compounds in the crust outside of the silver. A layer composed largely of metallic copper is produced on top of the silver. In order to expose the silver underneath the article in question, at the completion of the electrolytic treatment, it is carefully dipped alternately in dilute nitric acid (10%) and in warm water until all of the copper is removed. For the removal of the last traces of copper deposited on the silver it is safer to use formic acid instead of nitric and thus avoid any possible etching of the silver surface.

Among the Greeks and Romans, and likewise among the ancient Chinese, it was often customary to apply hammered gold-leaf to the surface of bronze objects. Take, for example, the author's investigation of a decorated Roman bronze plaque which had been used for architectural purposes. The original plaque was of solid bronze, and to the surface was applied gold-leaf about  $\frac{1}{1,000}$  in. thick (the human hair is about  $\frac{1}{1,000}$  in. in diameter). During the process of corrosion the copper and tin salts passed through the pores of the gold-leaf and formed a heavy green crust. To remove the crust by one of the older methods of restoration, such as the chisel method or the acid method, would have resulted in complete failure, since the bronze proper was entirely mineralized and the gold-leaf had no mechanical strength, although it was tightly embedded or anchored in the red-green crust. By applying the electrolytic method of restoration, a "restored" plaque, composed of an upper and lower layer of metallic copper and in between the layer of gold-leaf was obtained. By very careful manipulation, the upper layer of the copper was dissolved and the gold underneath exposed.

**Preserving the Restored Bronzes and Other Alloys.**—In the case of the ordinary copper-tin and copper-tin-lead bronzes, the surface obtained by the electrolytic restoration method was coppery in colour, very much like the surface of freshly cast high copper alloys. This appearance of "newness" is usually an objection from an artistic point of view. Nearly all ancient and many modern bronzes on exhibit to-day have coats of patina either naturally formed or artificially applied. One of the commonest reagents used for *patinating* bronzes is salammoniac ( $\text{NH}_4\text{Cl}$ ). However, we can not too strongly warn against the use of this salt as it will often give rise to that treacherous "bronze disease" more fully described below. Examining a large number of natural patinas, in particular those formed in Egypt, Greece and ancient Rome, a number of different shades were found: There is the beautiful red of cuprous oxide, the green of malachite and the blue of azurite. In this investigation it was evident that the

closer the approach to the natural conditions under which the patinas are formed, the more beautiful and artistic would be the results. Accordingly, such methods as applying solutions with a brush or cloth were eliminated at the start. The final procedure as now used consists in exposing the bronze to carbon dioxide gas after a preliminary exposure to fumes of ammonia or acetic acid or both. Beautiful shades of blues and greens are produced in irregular patches. In our American and European climates the greens are the most stable, the blue shades turning to green after some months. To produce the red shades of patina is decidedly more difficult. Artistic effects can be produced by submerging the bronze in a suspension of precipitated chalk to which has been added a little iodine, as tincture of iodine. This treatment had best precede the carbonic acid treatment described above. After the bronze object has been patinated, it is then carefully dried in an oven (232° F) and upon partially cooling it is sprayed with a dilute solution of bees-wax in benzol. There is left behind an unbroken film of bees-wax more lasting and protective than most of the lacquer preparations commonly used to-day.

Silver objects of art are usually kept in the bright polished condition, although a few collectors prefer the black sulphide patina. Accordingly, in the case of the silver articles restored by our process these are, after restoration, carefully dried in an electric oven (gas ovens tarnish the silver) kept at a temperature slightly above the boiling point of water. Thereupon, the bees-wax coat is applied as described for the bronzes.

Gold or gold alloy objects seldom require a protective coating. However, if the gold is present merely as a thin leaf or film, it is better to apply the wax coating as for bronzes, in order to protect the base metal underneath the gold-leaf. But even this wax film is not an absolute protection against the destructive action of the contaminated atmosphere of a modern city. All metal objects of art should be kept in *glass cases*. The atmosphere within the case can be "corrected" by placing within the show case small open containers filled with sticks of caustic soda or caustic potash. As soon as these sticks turn to a thick liquid paste the containers should be cleaned out, dried and filled with fresh caustic. The less frequently a case is opened and the better it is sealed, the longer will the caustic remain effective.

**The Bronze Disease.**—The term "bronze disease" or "collector's plague" as usually applied, refers to a highly localized and usually accelerated form of corrosion. A bronze vase covered with a beautiful shiny patina may suddenly show a dull, light green spot, often not bigger than the head of a pin. If neglected, this spot grows in size more or less rapidly, depending to a large extent upon the composition of the surrounding atmosphere. The "bronze disease" has been known for many years. The "disease" may at times break out as an epidemic and nearly every bronze in a collection be affected. A "healthy" bronze may be inoculated by a mere touch of fingers which have been handling sick bronze. The immediate cause of this localized infection is difficult to determine and many have been the conjectures proffered. Our own researches indicate that one of the most frequent causes of the "bronze disease" is a grain of ammonium or other chloride or sulphate which in the presence of a little moisture reacts with the copper in the bronze to form a complex copper chloride or sulphate. This latter chloride or sulphate is unstable, however, in the presence of carbonic acid and moisture of the atmosphere and is soon converted to a basic carbonate such as malachite. The hydrochloric or sulphuric acid thus liberated is free to act upon further areas of the bronze. Bronzes saturated with chlorides that had shown no signs of the disease as long as they remained in a comparative dry location, at once developed the disease upon being transferred to a moist climate. Samples of atacamite, the natural basic copper chloride mineral, and samples of brochantite, a natural basic copper sulphate, occurring in the arid regions of Chile, upon being shipped to New York and there exposed to the air immediately underwent decomposition resulting in a final copper carbonate compound.

Bronzes infected with the disease should be washed in repeated changes of boiling distilled water. In case the disease is deeply rooted the only safe procedure is to make the bronze object

a cathode in a 2% sodium hydrate solution and electrolyze as in the case of the restoration process described above. During electrolysis the chloride, sulphate and other acid radicals pass to the iron anode there reacting to form basic iron salts which precipitate out of solution.

**Detection of Frauds.**—The manufacture of "antiques" is an industry of increasingly large proportions and it has become more and more difficult to determine whether or not a certain object is genuine or "faked." In the case of oil paintings, chemical analysis, the microscope and the X-ray have been of inestimable value and with very few exceptions conclusive answers are obtained. In the case of bronzes and other metal art objects, the detection of frauds is considerably more difficult. However, the following procedure in the examination of a doubtful specimen has been found most satisfactory and reliable: (1) microscopic examination of the patina or crust; (2) chemical analysis of the patina or crust; (3) metallographic examination of the metal core and the metal in direct contact with the patina or crust; (4) chemical analysis of the metal (or metals). In the examination of the patina we may find distinct crystalline growths of malachite or azurite, the tiny crystals partially imbedded in the underlying oxide film. Such crystalline growths are most difficult to imitate and patinas of recent origin are almost always amorphous or non-crystalline. Nevertheless, the patina may be recently formed or applied and yet the bronze may be genuine—in fact, very many of the genuine bronzes exhibited nowadays have patinas of recent or artificial formation. Accordingly, if the microstructure of the malachite or azurite particles in the crust or in the patina is distinctly crystalline and interlaced with the copper oxide layer, the bronze is very likely genuine. But an amorphous malachite deposit does not necessarily imply that the underlying bronze is not genuine. Under the outermost coating of malachite or azurite or clayey material there usually is found, in the case of genuine bronzes, a layer of copper oxide, reddish-brown to reddish-black in colour. This layer is usually of considerable thickness and is not readily applied by any rapid artificial process. In the metallographic examination of the bronze we find additional proof as to whether or not the bronze is genuine. Taking a very fine slice of metal from some inconspicuous part of the bronze, and preparing this by polishing and etching for microscopical examination we note in the case of a genuine bronze that there is a gradual change in structure as we pass to the outer exposed edge of the bronze; furthermore, we will sometimes note changes that are brought about by a very slow process of "annealing." We have referred to the process of decupercification above. Chemical analysis must be carried out with great care. We can support the findings of our metallographic investigation by determining chemically that the main body or interior of the bronze has a decidedly different composition from the layers under the outer oxide or patina surface. (C. G. F.)

**BRONZING**, a process by which a bronze-like surface is imparted to objects of metal, plaster, wood, etc. On metals a green bronze colour is sometimes produced by the action of such substances as vinegar, dilute nitric acid and sal-ammoniac. An antique appearance may be given to new bronze articles by brushing over the clean bright metal with a solution of sal-ammoniac and salt of sorrel in vinegar, and rubbing the surface dry, the operation being repeated as often as necessary. Another solution for the same purpose is made with sal-ammoniac, cream of tartar, common salt and silver nitrate. With a solution of platonic chloride almost any colour can be produced on copper, iron, brass or new bronze, according to the dilution and the number of applications. Articles of plaster and wood may be bronzed by coating them with size and then covering them with a bronze powder, such as Dutch metal, beaten into fine leaves and powdered. The bronzing of gun-barrels may be effected by the use of a strong solution of antimony trichloride. A surface of copper or brass may be given an "oxidized" finish by treatment with a solution of a sulphide or an arsenical salt.

**BRONZINO, IL**, the name given to ANGELO ALLORI (1503-1572), Florentine painter. Bronzino was born at Monticelli, near Florence, on Nov. 17, 1503, and studied under Raffaellino del

BY COURTESY OF (1-5, 8-10) THE METROPOLITAN MUSEUM OF ART, NEW YORK, (6, 7) THE CLEVELAND MUSEUM OF ART

#### ELECTROLYTIC TREATMENT OF ANCIENT BRONZES

- 1 and 2. Front views of a copper plate about 6 in. (15 cm.) in diameter, before and after treatment. It was badly corroded and covered with a thick green crust, which was successfully reduced revealing the form of the plate and the almost complete design engraved on it
- 3 and 4. Satyr's head in repoussé from a Greek bronze mirror, end of the 5th century B.C., before and after restoration. The tip of the nose had been broken off previous to treatment
5. Egyptian bronze statuette of the goddess Isis holding the child Horus (early Ptolemaic period, 300-200 B.C.), before treatment. The white spots are "diseased" regions of copper carbonate plus chloride. The left hand was corroded. A hard green crust covered the rest of the body
- 6 and 7. Roman bronze head, probably of the Augustan period, before and after treatment. It had been badly marred in the process of excavation and the surface was much corroded. A new surface of blue-green patina was evolved on the restored bronze by electro-chemical action
8. Bronze statuette shown in fig. 5, after a treatment of 21 days. Following the treatment, it was washed in warm water and patinated by submitting it to fumes of ammonia and acetic acid
- 9 and 10. Cat with kittens, an Egyptian bronze group statuette of the early Ptolemaic period (300-200 B.C.), before and after treatment. The surface was badly corroded and covered with a grey-green crust. The heads of two of the kittens had long ago been broken off

Carbo and Jacopo da Pontormo. He was influenced by Michael Angelo and worked in Florence, where he was court portrait painter to Cosmo I., Duke of Tuscany. With the exception of Andrea del Sarto, he was the greatest portrait painter produced by Florence in the 16th century. He also painted sacred and decorative subjects, good examples of which are the "Venus, Cupid, Folly, and Time" in the National Gallery, London, and the "Limbo or the Descent of Christ into Hades," painted in 1552, in the Uffizi at Florence. The "St. Julian," and the "Judith and Holofernes," in the Pitti Palace, are among his most famous works. Of the latter there are many copies in different galleries. He painted portraits of some of the famous men of his day, including Dante, Petrarch, and Boccaccio. His three fine paintings of Eleonora di Toledo, grand duchess of Tuscany, are in the Uffizi, the Kaiser Friedrich Museum, Berlin, and the Wallace collection, London. He was a poet as well as a painter and a member of the Florentine academy. He died in Florence on Nov. 23, 1572.

**BRONZITE**, in mineralogy, a member of the pyroxene group that crystallizes in rhombic system (see PYROXENE). The name was originally applied to the members of the series exhibiting a bronzelike lustre, due to the presence of regularly arranged inclusions. These inclusions appear in most cases to be ilmenite arranged in plates parallel to the crystallographic plane (100). They are probably, as in the similar case of diallage (*q.v.*), products of unmixing, separating from solid solution in the pyroxene on fall of temperature.

**BROOCH** or **BROACH**, originally an awl or bodkin, denotes a clasp or fastener for the dress, provided with a pin, having a hinge or spring at one end and a catch or loop at the other. Brooches of the safety-pin type (*fibulae*) were extensively used in antiquity, but the place of origin cannot as yet be exactly determined; it would seem to have been in central Europe, towards the close of the Bronze age, somewhat before 1000 B.C. The earliest form is little more than a pin, bent round for security, with the point caught against the head, but from the third century or thereabout, brooches have developed into works of art, many of which are exquisitely decorated and ingeniously constructed. (See JEWELLERY.)

**BROOKE, FRANCES** (1724-89), English novelist and dramatist, whose maiden name was Moore, wrote novels popular in their day. The most important were *The History of Lady Julia Mandeville* (1763), *Emily Montague* (1769) and *The Excursion* (1777). Her dramatic pieces and translations from the French are now forgotten.

**BROOKE, FULKE GREVILLE**, 1ST BARON (1554-1628), English poet, only son of Sir Fulke Greville, was born at Beauchamp Court, Warwickshire. He was sent in 1564, on the same day as his life-long friend, Philip Sidney, to Shrewsbury school. He matriculated at Jesus college, Cambridge, in 1568. Sir Henry Sidney, president of Wales, gave him in 1576 a post connected with the court of the Marches, but he resigned it in 1577 to go to court with Philip Sidney. Young Greville became a great favourite with Queen Elizabeth, who treated him with less than her usual caprice, but he was more than once disgraced for leaving the country against her wishes. Philip Sidney, Sir Edward Dyer and Greville were members of the "Areopagus," the literary clique which, under the leadership of Gabriel Harvey, supported the introduction of classical metres into English verse. Sidney and Greville arranged to sail with Sir Francis Drake in 1585 in his expedition against the Spanish West Indies, but Elizabeth peremptorily forbade Drake to take them with him, and also refused Greville's request to be allowed to join Leicester's army in the Netherlands. Philip Sidney, who took part in the campaign, was killed on Oct. 17, 1586, and Greville shared with Dyer the legacy of his books, while in his *Life of the Renowned Sir Philip Sidney* he raised an enduring monument to his friend's memory. About 1591 Greville served for a short time in Normandy under Henry of Navarre. This was his last experience of war. In 1583 he became secretary to the principality of Wales, and he represented Warwickshire in parliament in 1592-93, 1597, 1601 and 1620. In 1598 he was made treasurer of the navy. In 1614 he became chancellor and under-treasurer of the exchequer, and throughout

the reign of James I. was a valued supporter of the king's party, although in 1615 he advocated the summoning of a parliament. In 1618 he became commissioner of the Treasury, and in 1621 he was raised to the peerage with the title of Baron Brooke, a title which had belonged to the family of his paternal grandmother, Elizabeth Willoughby. He received from James I. the grant of Warwick castle, in the restoration of which he is said to have spent £20,000. He died on Sept. 30 1628.

His only works published during his lifetime were four poems, one of which is the elegy on Sidney which appeared in *The Phoenix Nest* (1593), and the *Tragedy of Mustapha*. A volume of his works appeared in 1633, another of *Remains* in 1670, and his biography of Sidney in 1652. He wrote two tragedies on the Senecan model, *Alaham* and *Mustapha*.

Brooke left no sons, and his barony passed to his cousin, ROBERT GREVILLE (*c.* 1608-1643), who thus became 2nd Lord Brooke. This nobleman was an active member of the parliamentary party, and defeated the Royalists in a skirmish at Kington in Aug. 1642. He was killed at Lichfield on March 2 1643. Brooke, who is eulogized as a friend of toleration by Milton, wrote on philosophical, theological and current political topics. In 1746 his descendant, Francis Greville, the 8th baron (1719-1773), was created earl of Warwick, a title still in his family.

Dr. A. B. Grosart edited the complete works of Fulke Greville for the *Fuller Worthies Library* in 1870, and made a small selection, published in the *Elizabethan Library* (1894). The life of Sidney was reprinted by Sir S. Egerton Brydges in 1816, and with an introduction by N. Smith in the "Tudor and Stuart Library" in 1907; *Caelica* was reprinted in M. F. Crow's "Elizabethan Sonnet Cycles" in 1898. See also an essay in Mrs. C. C. Stopes's *Shakespeare's Warwickshire Contemporaries* (1907).

**BROOKE, HENRY** (*c.* 1703-1783), Irish author, of county Cavan, studied at Trinity college, Dublin, and then went to London to study law. He wrote a philosophical poem in six books entitled *Universal Beauty* (1735), translated the first and second books of Tasso's *Gerusalemme liberata* (1738), and produced a tragedy, *Gustavus Vasa, the Deliverer of his Country* (1739). This play had been rehearsed for five weeks at Drury Lane, but at the last moment the performance was forbidden, on account of a supposed portrait of Sir Robert Walpole in the part of Trollio. The piece was printed and sold largely, being afterwards put on the Irish stage under the title of *The Patriot*. This affair provoked a satirical pamphlet from Samuel Johnson. He then returned to Ireland. During the Jacobite rebellion of 1745 Brooke issued his *Farmer's Six Letters to the Protestants of Ireland* (collected 1746), the form of which was suggested by Swift's *Drapier's Letters*. For this service he received the post of barrack-master at Mullingar, which he held till his death. About 1760 he entered into negotiations with leading Roman Catholics, and in 1761 he wrote a pamphlet advocating alleviation of the penal laws against them. His best-known work is the novel entitled *The Fool of Quality; or the History of Henry Earl of Moreland* (1765-1770). The characters of this book, which relates the education of an ideal nobleman by an ideal merchant-prince, are gifted with a "passionate and tearful sensibility," and reflect the real humour and tenderness of the writer. Brooke's religious and philanthropic temper recommended the book to John Wesley, who edited (1780) an abridged edition, and to Charles Kingsley, who published it with a eulogistic notice in 1859. He died at Dublin in a state of mental infirmity on Oct. 10, 1783.

**BIBLIOGRAPHY.**—His daughter, Charlotte Brooke, published *The Poetical Works of Henry Brooke* in 1792, but was able to supply very little biographical material. Other sources for Brooke's biography are C. H. Wilson, *Brookiana* (1804), and a biographical preface by E. A. Baker prefixed to a new edition (1906) of *The Fool of Quality*. Brooke's other works include several tragedies, only some of which were actually staged. He also wrote: *Jack the Giant Killer* (1748), an operatic satire, the repetition of which was forbidden on account of its political allusions; "Constantia, or the Man of Law's Tale" (1741), contributed to George Ogle's *Canterbury Tales Modernized*; *Juliet Grenville; or the History of the Human Heart* (1773), a novel; and some fables contributed to Edward Moore's *Fables for the Female Sex* (1744).

**BROOKE, SIR JAMES** (1803-1868), English soldier, traveller and rajah of Sarawak, was born at Coombe Grove near Bath.

He entered the service of the East India Company, and was sent out to India about 1825. On the outbreak of the Burmese War he was despatched with his regiment to the valley of the Brahmaputra; he was dangerously wounded in an engagement near Rungpore and was compelled to return home (1826). In 1830 he made a voyage to China, and during his passage among the islands of the Indian archipelago he conceived the great design of rescuing them from barbarism. On the death of his father he succeeded to a large property and bought and equipped the "Royalist," sailing in 1838 on his great adventure. On reaching Borneo he found the rajah Muda Hassim, uncle of the reigning sultan, engaged in war in the province of Sarawak with several of the Dyak tribes, who had revolted against the sultan. He offered his aid to the rajah, and the insurgents were defeated. For his services the title of rajah of Sarawak was conferred on him by Muda Hassim, but it was not until 1841 that the sultan of Borneo confirmed his title. For the next few years Brooke devoted himself to preparing a code of laws and developing commerce, at the same time stamping out the piracy which made all shipping unsafe among the islands. In his various expeditions against the raiders he was assisted by Sir Harry Keppel and other commanders of British ships of war. The capital of the sultan of Borneo was stormed and the sultan routed with his army. In 1847 Brooke returned to England and the Corporation of London conferred on him the freedom of the City. He was appointed governor and commander-in-chief of the island of Labuan with its dependencies (made a British colony after purchase from the sultan of Borneo). He was also made consul-general of Borneo. In 1849 he led an expedition against the Seribas and Sakuran Dyaks, who still persisted in piracy. He visited twice the capital of the sultan of Sala and concluded a treaty with him, which had for one of its objects the expulsion of the sea-gipsies and other tribes from his dominions. In 1851 grave charges with respect to the operations in Borneo were brought against Sir James Brooke in the House of Commons by Joseph Hume and other members, especially as to the "head-money" received. To meet these accusations and to vindicate his proceedings, he went to England. The evidence adduced was so conflicting that the matter was at length referred to a royal commission, which sat at Singapore. As the result of its investigation the charges were declared to be "not proven." Sir James, however, was soon after deprived of the governorship of Labuan and the head-money was abolished. In 1867 his house in Sarawak was attacked and burnt by Chinese pirates and he had to fly from the capital, Kuching. With a small force he attacked the Chinese and recovered the town. In the following year he returned to England, and remained there for three years. During that time he was attacked by paralysis, a public subscription was raised, and an estate in Devonshire was bought and presented to him. He made two more visits to Sarawak, and on each occasion had a rebellion to suppress. He spent his last days on his estate at Burrator in Devonshire, and on his death was succeeded, as rajah of Sarawak, by his nephew. Sir James Brooke was a man of the highest personal character, and he displayed unusual courage both in his conflicts in the East and under the charges advanced against him in England.

His *Private Letters* (1838 to 1853) were published in 1853. Portions of his *Journal* were edited by Captains Munday and Keppel (see also SARAWAK).

**BROOKE, RUPERT** (1887-1915), English poet, son of William Parker Brooke and Mary Cotterill, was born at Rugby on Aug. 3, 1887, and educated in his father's House at Rugby school. After winning poetry prizes and playing cricket and football for the school, he went to King's college, Cambridge, with a scholarship in 1906. He played a leading part in university life, helped to found the Marlowe Dramatic Society, became President of the Fabians, and took a second in Classics; and here, as throughout his life, the charm of his personality, in which his remarkable good looks were only one element, gained him innumerable friends. For the next three years he lived mainly at Grantchester, writing poetry and studying the Elizabethan drama, and paid long visits to Munich and Florence in 1911, and Berlin in 1912. His *Poems* were published in December 1911. He won

a fellowship in 1913 with a dissertation on John Webster. In May 1913 he started on a year of travel in America and the South seas. In September 1914 he received a commission in the Royal Naval Division, with which he took part in the Antwerp Expedition and sailed for the Dardanelles. He died of blood-poisoning in Scyros on April 23, 1915.

He had ambitions for play-writing; though too much must not be built on his only attempt, the one-act melodrama *Lithuania*, his sense of the theatre, combined with that "sympathetic imagination for everybody and everything" which he called "the artist's one duty," were a good equipment. As for prose, his dissertation on Webster shows critical power and industrious scholarship. The *Letters from America*, full of observation and humour, have many passages of great beauty; and a word must be said of the charm of his intimate letters. In the earlier *Poems* (1905-08) he is still a boy. He writes with gusto, and a sense of verbal and metrical beauty, neither quite under control; he is too lavish with the token-coins of poetry; and though there is hardly a poem without some memorable phrase or passage, the general effect is a little turgid. The later section (1908-11) shows a great advance. Though both in his rapture and his disillusion there is still an immaturity of exuberance and bravado, and a few poems are provocatively disgusting, the beauties are more abundant. The *Human Body* (in which the influence of his favourite poet Donne shows most clearly) and two or three sonnets are completely successful; and *Diningroom Tea*, with its curiously concrete rendering of an elusive experience, is one of his finest pieces. Next came *Grantchester* (1912). This lovely poem, in its combination of tenderness and whimsicality, both steeped in the essence of poetry, is the first perfect example of that mingling of humour and beauty which is perhaps his chief distinguishing mark. Written in Germany, it is also the first expression of his deep love for England. In the best of the poems written on his travels he steps out as a master of his craft; the sonnets *Clouds* and *Psychical Research*, with the exquisite *Tiare Tahiti*, mark the highest level of his accomplishment. The publication of 1914, almost coinciding with the news of his death, won him immediate fame. Written in the chivalrous ardour of the first moment, the sonnets are in strong contrast with the later poetry of trench-warfare; and nothing better has been said about their historical aspect than the words of Winston Churchill: "A voice had become audible, a note had been struck, more true, more thrilling more able to do justice to the nobility of our youth in arms than any other—more able to express their thoughts of self-surrender, and carry comfort to those who watched them so intently from afar." Finally, the fragments written on his last voyage, in their union of profound feeling with the perfection of phrase and movement, hold more surely than anything else he wrote the promise of a great poet. (E. M.)

**BROOKE, STOPFORD AUGUSTUS** (1832-1916), English divine and man of letters, born at Letterkenny, Donegal, Ireland, was educated at Trinity college, Dublin. He was ordained in the Church of England in 1857, and held various charges in London. From 1863 to 1865 he was chaplain to the Emperor Frederick in Berlin, and in 1872 he became chaplain in ordinary to Queen Victoria. But in 1880 he seceded from the church, being no longer able to accept its leading dogmas, and officiated as Unitarian minister for some years at Bedford chapel, Bloomsbury. Bedford chapel was pulled down about 1894, and from that time he had no church of his own, but his eloquence and powerful religious personality continued to make themselves felt about a wide circle. He died at Ewhurst, Surrey, on March 18, 1916.

He published in 1865 his *Life and Letters of F. W. Robertson* (Brighton), and in 1876 wrote an admirable primer of *English Literature* (new and revised ed., 1900), followed in 1892 by *The History of Early English Literature* (2 vols., 1892) down to the accession of Alfred, and *English Literature from the Beginnings to the Norman Conquest* (1898). His other works include various volumes of sermons; *Theology in the English Poets—Cowper, Coleridge, Wordsworth, Burns* (1874); *Poems* (1888); *Dove Cottage* (1890); *Tennyson's Art and Relation to Modern Life* (1894); *The Poetry of Robert Browning* (1902); *On Ten Plays of Shakespeare* (1905); and *The Superlative* (1906). See L. P. Jacks, *Life and Letters of Stopford Brooke* (1917).

**BROOK FARM** (1841-47), an institute of agriculture and education, situated on 160 ac. at West Roxbury (Mass.), 9m. from Boston, was organized in the summer of 1841 by the Rev. George Ripley, a former Unitarian minister, an editor of *The Dial*, a critical literary monthly, and a leader in the Transcendentalists club, an informal gathering of the intellectuals of the period and vicinity. He was aided by his wife, Sophia Dana Ripley, a woman of wide culture and academic experience. According to the articles

BROOK FARM, HEADQUARTERS OF THE SECOND MASSACHUSETTS INFANTRY IN 1861, 14 YEARS AFTER THE ABANDONMENT OF THE SITE AS A SCHOOL BY THE NEW ENGLAND TRANSCENDENTALISTS

of agreement, their desire was to combine the thinker and the worker, to guarantee the highest mental freedom, to prepare a society of liberal, intelligent, and cultivated persons whose relations with each other would permit a more wholesome and simple life than could be led amidst the pressure of competitive institutions. There was no religious creed. Truth, justice, and order were the governing principles. Each individual was free in so far as he did not violate the rights of others.

The project was financed by the sale of stock, a purchaser of one share becoming automatically a member of the institute. It was governed by a board of directors. The profits, if any, after all payments and improvements, were divided into a number of shares corresponding with the number of days' labour, every member entitled to one share for each day's labour performed. Among the original shareholders were Charles A. Dana and Nathaniel Hawthorne, who served together as the first directors of agriculture. Other members were John S. Dwight, Minot Pratt, George Partridge, Bradford and Warren Burton. Ralph Waldo Emerson, Amos Bronson Alcott, Margaret Fuller, Theodore Parker, Orestes A. Bronson, and William Henry Channing were interested visitors. It attracted not only intellectuals—though teachers remained ever in excess of farmers—but carpenters, shoemakers, and printers. It paid a dollar a day for work (physical or mental) to men and to women, and provided to all members, their children and family dependents, housing, fuel, clothing and food at approximately actual cost. For four years it published *The Harbinger*, a weekly magazine devoted to social and political problems, to which James Russell Lowell, J. G. Whittier, and Horace Greeley occasionally contributed.

In educational theory it was modern, desiring "perfect freedom of intercourse between students and teaching body." For the first and second years disciplinary measures consisted in the attempt to arouse a sense of personal responsibility, and to communicate a passion for intellectual work. There were no prescribed study hours, and each student was required to give a few hours a day to manual labour—the girls to kitchen and laundry work, the boys to hoeing and chopping. There was an infant school, a primary school, a college preparatory course covering six years. Latin, Italian, German, moral philosophy, Greek, higher mathematics, botany, the English classics, music and drawing were taught, and during the brief period of existence it attracted students from Manila, Havana, and Florida. George William Curtis, Father Isaac Thomas Hecker, and Gen. Francis C. Barlow were early students there.

For a while it looked as though the ideal of the founders would have something of a practical realization. Within three years the

community—or "Phalanx" as it was called after 1844—which had begun with the original farmhouse and a small building known as the school, had grown to include four houses, work rooms, and dormitories. Then, though financing had been a constant difficulty, it of necessity put all available funds into the construction of a large central building to be known as the Phalanstery, and the leaders were still optimistic of the permanence of their venture when on the night of March 2, 1846, while they celebrated with a dance the completion of the new building, the alarm was given that it was on fire. It burned to the ground, and though the colony struggled on for a while, "the enterprise faded, flickered, died down, and expired," and the land and buildings were sold at auction on April 13, 1849.

See John Thomas Codman, *Brook Farm* (Boston, 1894); Lindsay Swift, *Brook Farm* (1900); and Morris Hillquit's *History of Socialism in the United States* (1903).

**BROOKFIELD**, a city of Linn county (Mo.), on Federal highway 36 and the Burlington railway, about 130m. N.E. of Kansas City. The population in 1930 was 6,428. It ships large quantities of grain, hay, poultry and livestock; has railroad shops and a shoe factory; and is in the "Lafayette" coal-field. The city was founded in 1858 and incorporated in 1872.

**BROOKHAVEN**, a city in the pine forest region of southwestern Mississippi, U.S.A., on Federal highway 51, and served by the Illinois Central and the Mississippi Central railways; the county seat of Lincoln county. The population was 4,706 in 1920; in 1930, 5,288. Brookhaven is the centre of large lumbering and agricultural interests; a shipping point for cotton; and the seat of Whitworth college for women (established 1858). The city was founded about 1854 and incorporated in 1870.

**BROOKINGS**, a city near the eastern boundary of South Dakota, U.S.A., three m. E. of the Big Sioux river; the county seat of Brookings county. It is on Federal highway 14, and is a division on the Chicago and North-western railway. The population in 1930 was 4,376.

The city is beautiful with tree-lined streets and grassy lawns. It owns and operates its telephone plant; and its light and power plant supplies heat for the schools and the business section of the city. There are grain elevators and creameries, machine shops, flour and tow mills, and factories making gloves, cigars, cement block, and tyre-treads. At the N.E. corner of the city is the State College of Agriculture and Mechanic Arts (established 1881), which has farms of 700ac. for teaching and experimental purposes, a net enrolment of 1,300 students, and an endowment of Federal land grants amounting to 160,000 acres. Brookings was founded in 1879, and incorporated in 1883. A commission form of government was adopted in 1920.

**BROOKITE**, one of the three modifications in which titanium dioxide ( $\text{TiO}_2$ ) occurs in nature; the other minerals with the same chemical composition, but with different physical and crystallographic characters, being rutile (*q.v.*) and anatase (*q.v.*). The two latter are tetragonal in crystallization whilst brookite is orthorhombic. The name was given in honour of the English mineralogist H. J. Brooke (1771-1857). Two types of brookite crystals may be distinguished. The commoner type of crystals are thin and tabular, and often terminated by numerous small and brilliant faces. These crystals are of a rich reddish-brown colour and are often translucent. Crystals of the second type have the appearance of six-sided bipyramids; these crystals are black and opaque, and constitute the variety known as arkansite.

The lustre of brookite is metallic-adamantine. There is no distinct cleavage (rutile and anatase have cleavages); hardness 5½-6; sp. gr. 4.0. The optical characters are interesting: the optic axes for red and for blue light lie in planes at right angles to each other, whilst for yellow-green light the crystals are uniaxial. The acute bisectrix of the optic axes is perpendicular to the orthopinacoid for all colours, so that this phenomenon of the crossing of the optic axial planes may be readily observed in the thin tabular crystals of the first-mentioned type.

Brookite occurs only as crystals, never in compact masses, and is usually associated with either anatase or rutile. The crystals are found attached to the walls of cavities in decomposed

igneous rocks and crystalline schists; it is also found as minute isolated crystals in many sedimentary rocks. The best-known locality is Fronolen, near Tremadoc, in North Wales, where crystals of the thin tabular habit occur with crystallized quartz, albite and anatase on the walls of crevices in diabase. Similar crystals of relatively large size are found attached to gneiss at several places in the Swiss and Tirolese Alps. (L. J. S.)

**BROOKLINE**, known botanically as *Veronica Beccabunga* (family Scrophulariaceae), a succulent herb growing on margins of brooks and ditches in the British Isles, and a native of Europe, north Africa and northwestern Asia, and naturalized in eastern North America. It has smooth spreading branches, blunt oblong leaves and small blue or pink flowers. The similar American brookline (*V. Americana*) occurs in wet places from Anticosti to Alaska, and southward to Pennsylvania and California.

**BROOKLINE**, a residential town of Norfolk county, Massachusetts, U.S.A., almost surrounded by Boston, and separated from the rest of Norfolk county by parts of Suffolk and Middlesex counties. Within its limits are the villages of Brookline, Cottage Farms, Longwood, Beaconsfield and Chestnut Hill. The Chestnut Hill reservoir is just outside its western boundary. It is served by the Boston and Albany railroad and by Boston electric lines. Its land area is 6.63 sq.m. The population in 1930 was 47,490 (Federal census).

Brookline is the largest municipality of Massachusetts that still operates under a town government, and for its size is wealthiest of all the cities and towns of the country with a population of 30,000 or more. The assessed valuation of property in 1926 was \$149,351,500, giving a *per caput* valuation of about \$3,400. It has long been regarded as a model suburb. It was the home of Frederick Law Olmsted, the landscape gardener, and contains many examples of his work. The only manufactures of consequence are automobile bodies and scientific apparatus. Brookline was originally a part of Boston, called Muddy River Hamlet. The town of Brookline was set apart from Boston and incorporated in 1705. Until 1793 it was a part of Suffolk county.

**BROOKLYN**, formerly a city of New York State, U.S.A., but since 1898 a borough of New York city (*q.v.*), situated at the south-west extremity of Long Island. It is conterminous with Kings county, and is bounded north by the borough of Queens, from which it is separated in part by Newtown creek; east by the borough of Queens and Jamaica bay; south by the Atlantic ocean; west by Gravesend bay, the Narrows, upper New York bay and East river, which separate it from Staten island, Jersey City and the borough of Manhattan. It has a water front of 33 m. and extends over an area of 74.14 square miles. Pop. (1880) 599,495; (1890, then Kings county) 838,547; (1900) 1,166,582; (1910) 1,634,351; (1920) 2,018,356; (1925, State census) 2,203,991; 1930 by Federal census it was 2,560,401. Of the total inhabitants in 1925, 1,799,128 were citizens and 404,863 were aliens. Brooklyn's population then represented over 37.5% of the total (5,873,356) for greater New York.

Brooklyn is connected with Manhattan by three bridges across the East river—the lowest, known as the Brooklyn, opened in 1883; the Williamsburgh, opened in 1903; and the Manhattan, opened in 1909. Ferries ply at frequent intervals between numerous points of its west water front and points in Manhattan; there are also ferry connections with Staten island and Jersey City. Brooklyn is served directly by the Long Island railway, by numerous coast-wise and trans-Atlantic steamship lines and by elevated or surface-car lines on a large number of its streets. Subway lines, begun in 1904, connect Brooklyn with the subway systems of Manhattan.

**Places of Interest and Buildings.**—The surface of Brooklyn in the west section, from the lower course of the East river to Gravesend bay, varies in elevation from a few inches to nearly 200 ft., above sea-level, the highest points being in Prospect park; but steep street grades even in this section are rare, and elsewhere the surface is either only slightly undulating or, as in the east and south, flat. The principal business thoroughfare is Fulton street, which begins at Fulton ferry nearly under the Brooklyn bridge, runs to Borough Hall park, and thence across the north central

section of the borough. In the Borough Hall park are the borough hall, the hall of records, the new municipal building and the county court-house. Two blocks to the north (on Washington street) is the post-office, a fine granite Romanesque building. On Wallabout bay at the bend of the East river to the westward is the U.S. navy yard, the principal one in the United States, established in 1801, and commonly but incorrectly called the Brooklyn navy yard. It occupies altogether about 144 ac., contains a trophy park, parade grounds, officer's quarters, barracks and four large dry-docks (respectively 700, 595, 442 and 326 ft. long), foundries and machine shops. A short distance to the east is the largest and most interesting of Brooklyn's markets, the Wallabout, covering several city blocks. The buildings of this market are Dutch in style and have a quaint clock tower. At the lower end of the west water front, facing the Narrows, are a U.S. reservation and the harbour defences of Ft. Hamilton.

For a considerable portion of its inhabitants Brooklyn is only a place of residence, their business interests being in the borough of Manhattan; hence Brooklyn has been called the "city of homes" and the "dormitory of New York." Residential districts with social lines more or less distinctly drawn are numerous. The oldest is that on the picturesque Brooklyn Heights, west of Borough Hall park, rising abruptly from the river to a height of from 70 to 100 ft., and commanding an excellent view of the harbour. Here are hotels, large apartment-houses, many private residences and numerous churches and clubs. The south shore of Brooklyn has pleasure resorts; Coney island (*q.v.*) is the most popular.

**Parks and Cemeteries.**—Brooklyn has more than 60 parks, playgrounds and squares constituting an aggregate of about 1,400 acres. Of these the most attractive is Prospect park, occupying about 526 ac. of high ground in the west central part of the borough, on a site made memorable by the battle of Long Island. Its large variety of trees and shrubs, its flower gardens, a palm house, ponds, a lake of 61 ac. for boating and skating, a parade ground of 40 ac. for other athletic sports, a menagerie and numerous pieces of statuary, are among its objects of interest or beauty. Half a mile east of the borough hall is Fort Greene park (26 ac.) laid out on the site of earthworks (known as Ft. Greene) constructed during the American Revolution. The park system of Brooklyn also includes more than 30 m. of parkways. Notable among them are Ocean parkway, which extends from the southern entrance of Prospect park to Seaside park (10½ ac.), Coney island. Also from the south entrance of Prospect park extends Ft. Hamilton parkway south-east to Ft. Hamilton, and to Dyker Beach park (140 ac.), which faces the lower end of the Narrows. From Prospect park plaza, Eastern parkway extends east to connect with Rockaway parkway, which runs south-east to Canarsie park (37 ac.), on Jamaica bay. The Botanic garden (61.4 ac.) at Washington and Flatbush avenues is a place of great interest.

Greenwood cemetery, one of the most beautiful cemeteries in the United States, is about ½ m. S.W. of Prospect park. Among the principal monuments within its bounds are the soldiers', erected to the memory of those who died in the Civil War, and those erected to Roger Williams, S. F. B. Morse, Elias Howe, De Witt Clinton, Henry Ward Beecher, Peter Cooper, Horace Greeley, Henry Bergh, Henry George and James Gordon Bennett. At the main entrance is a beautiful gateway (of elaborate wrought brown stone), 142 ft. wide and having a central tower 100 ft. in height. Along the north-east border of the borough are Cypress Hills cemetery, adjoining Forest park, and the cemetery of the Evergreens, adjoining Highland Park and partly in the borough of Queens.

In the plaza at the northern entrance to Prospect park is a soldiers' and sailors' memorial arch, adorned with high-reliefs of Lincoln and Grant on horseback (by O'Donovan and Eskins) and with three large bronze groups (by Frederick MacMonnies). Immediately within the park there is a statue (also by MacMonnies) of J. S. T. Stranahan (1808–98), who did more than any other man for the development of Brooklyn's system of parks and boulevards. On the slope of Lookout Hill (185 ft.) within the park is a shaft erected in 1895 to the memory of the Maryland soldiers who valiantly defended the rear of the American army at the

battle of Long Island. In the flower garden are a number of busts of famous musicians and the Prospect park honour roll, commemorating the 2,800 Brooklyn soldiers who fell in the World War. A bronze statue of Lincoln overlooks the lake. At the ninth street entrance is the Lafayette memorial monument (by D. C. French), unveiled by Marshal Joffre and M. Viviani on May 10, 1917. In Ft. Greene park is a monument to the memory of the soldiers who died in the British prison ships during the American Revolution, many of them having been buried in a vault below. Facing the borough hall is a statue in bronze (by J. Q. A. Ward) of Henry Ward Beecher, mounted on a granite pedestal with a figure at one side to commemorate his sympathy for the slave. In the centre of Williamsburgh plaza stands an equestrian statue (by H. M. Shrady) of George Washington. A fine bronze statue of Alexander Hamilton (by W. O. Partridge) stands at the entrance of the Hamilton club and one of U. S. Grant (also by Partridge) stands at the entrance of the Union club.

**Museums, Schools and Libraries.**—The Brooklyn Institute of Arts and Sciences embracing numerous departments, of which those of music, philology and the fine arts have each more than 1,000 members, has general management of the Central museum, the Brooklyn Academy of Music, the Botanic garden and the Children's museum in Bedford park. The Central or Brooklyn museum, which is the outgrowth of the Apprentices' Library Association founded in 1824, is in Institute park, which is separated from Prospect park by Flatbush avenue. It contains besides paintings and statuary, natural history and mineral collections, archaeological gatherings, oriental objects and Amerindian collections. The museum and Botanic garden are supported in part by the city, but their collections are provided for entirely by private contributions.

Among the educational institutions of Brooklyn are: Pratt institute, founded in 1887 by Charles Pratt (1830-91), which is one of the best schools of engineering and the applied arts in the country; the Polytechnic institute, opened in 1855, is a high-grade school of technology; the Packer Collegiate institute, opened as the successor of the Brooklyn Female academy, in 1854, has primary, preparatory, academic and collegiate departments; Adelphi college, opened in 1806 for women, removed in 1929 to Garden City; a branch of the College of the City of New York gives courses in the liberal arts; St. Francis' college, opened 1858; St. John's college, opened 1870; and St. Joseph's, opened 1916 for women. The last three named institutions are maintained by the Roman Catholic Church. Here, too, are the law school of St. Lawrence university, the Long Island Hospital Medical college, the Brooklyn College of Pharmacy and several schools of music. (For public schools see NEW YORK CITY.) Among the larger libraries of the borough are the Brooklyn Public library, containing over 950,000 vols. and maintaining 31 branches, and those of the Long Island Historical Society, Pratt Institute Free Library, King's County Medical Society, Brooklyn museum and Children's museum, in an old family mansion, and a good law library in the county court-house.

Brooklyn is well provided with charitable institutions, and has long been known as the "city of churches," probably from the famous clergymen who have lived there.

**Manufactures and Commerce.**—Brooklyn is one of the most important manufacturing centres of the United States, most of the factories being located along or near the East river. There were in 1925, according to the U.S. census of manufactures, 4,293 industrial plants which gave employment to 137,962 wage-earners and paid \$198,304,066 in wages. The output of these factories was valued at \$1,081,081,923 as compared with \$3,592,098,357 for the industries of Manhattan and \$5,324,413,612 for the five boroughs combined. Two great dock and terminal companies—the New York Dock, extending from the foot of Fulton street to the Erie basin, and the Bush Terminal, in South Brooklyn—handle the major portion of the water-borne traffic. Opposite Governor's island is the Atlantic basin of 40 ac., with piers and brick and granite warehouses used largely for grain. A little farther south is another basin, the Erie, of about 100 ac., protected by a break-water one mile in length, occupied by piers, warehouses and dry-

docks. East of the Erie is the Gowanus Bay Barge Canal Terminal, a centre for Erie canal traffic, with a \$2,500,000 grain elevator. Of Brooklyn's large commerce, grain is the chief commodity; it is estimated that about four-fifths of that exported from the port of New York is shipped from here.

The water-supply of the borough is derived chiefly from the Catskill reservoirs of New York city (q.v.). The old Brooklyn system, which secured its supply from small streams along the south shore of Long island and from driven wells, is now used as a reserve. A part of Flatbush is supplied by the Flatbush Water Works company, a private company which secures its supply from driven wells.

**History.**—The first settlement within the present limits of Brooklyn was made in 1636, when some Dutch farmers took up their residence along the shore of Gowanus bay. About the same time other Dutch farmers founded Flatlands (at first called Amersfoort), on Jamaica bay, and a few Walloons founded Wallabout, where the navy yard now is. In 1642 a ferry was established across East river from the present foot of Fulton street, and a settlement grew up here which was known as The Ferry. The next year Lady Deborah Moody with some followers from New England founded Gravesend, near the southern extremity of the borough. Finally, in the year 1645, a settlement was established near the site of the present borough hall, and was called Breuckelen (also spelled Breucklyn, Breuckland, Brucklyn, Broucklyn, Brookland and Brookline) until about the close of the 18th century, when its orthography became fixed as Brooklyn. The name, Breuckelen, meaning marsh land, seems to have been suggested by the resemblance of the situation of the settlement to that of Breuckelen, Holland. Of the other towns which were later united to form the borough, New Utrecht was settled about 1650, Flatbush (at first called Medwood, Midwout or Midwood) about 1651, Bushwick and Williamsburg in 1660. During the American Revolution the chief event was the battle of Long island, fought on Aug. 27, 1776. In 1816, when the population of the town of Brooklyn was about 4,500, its most populous section was incorporated as a village; and in 1834, when its population had increased to 23,310, the whole town was incorporated as a city. By 1850 its population had increased to 138,882. In 1855 Williamsburgh, which had been incorporated as a city in 1851, and the town of Bushwick were annexed. Other annexations followed until the city of Brooklyn was conterminous with Kings county; and finally, on Jan. 1, 1898, the city of Brooklyn became a borough of New York city.

**BIBLIOGRAPHY.**—S. M. Ostrander, *A History of Brooklyn and Kings County* (1894); H. W. B. Howard (ed.), *History of the City of Brooklyn* (1893); H. Putnam, "Brooklyn" in L. P. Powell's *Historic Towns of the Middle States* (1899); F. van Wyck, *Keskachauge, or the First White Settlement on Long Island* (1924); and M. S. Welch, *Vronw Knickerbocker; the Romance of the Building of Brooklyn* (1926).

**BROOKLYN INSTITUTE OF ARTS AND SCIENCES, THE**, was founded in 1823 and incorporated in 1824 as the Brooklyn Apprentices' Library Association. It changed its name in 1843, under an amended charter, to Brooklyn Institute, was reorganized in 1887-88, and a new corporation established in 1890 under the present name. The old property of the Brooklyn Institute was transferred to it in 1891. Its object is to establish and maintain museums and libraries of art and science; to encourage the study of the arts and sciences and their application to the practical wants of man; to advance knowledge in science, and in general to provide means for instruction through its collections, libraries and lectures. Three general divisions comprise the activities of the institute: (1) The department of education with 23 auxiliary departments in the arts and sciences, its members having the privilege of attending some 350 lectures, recitals and dramatic readings annually. (2) The Brooklyn Museum of Fine Arts, Ethnology and Natural History, opened to the public in 1897, on a tract of land containing 11 $\frac{3}{4}$  ac., will when completed, cover an area of 560 sq. ft. with four interior courts. The Children's museum, Bedford park, is administered by the Brooklyn museum. (3) The Brooklyn Botanical Garden, opened to the public in 1911, comprises 50 ac. of land on which are located the various plantations, conservatories, laboratory and children's gar-

dens. The museum and botanic garden buildings and their maintenance are provided by the City of New York, the exhibits and research work by private donations. Fifty citizens constitute a board of trustees of the institute.

**BROOKS, CHARLES WILLIAM SHIRLEY** (1816-74), English novelist, playwright and journalist, was born in London April 29 1816, and died there Feb. 23 1874. He wrote, sometimes alone, sometimes in conjunction with others, slight dramatic pieces of the burlesque kind, among which may be mentioned *Anything for a Change* (1848) and *The Daughter of the Stars* (1850). In 1851 Brooks joined the staff of *Punch*, and noteworthy among his numerous contributions were the weekly satirical summaries of the parliamentary debates, entitled "The Essence of Parliament."

In 1870, on the death of Mark Lemon, "dear old Shirley," as his friends used to call him, was chosen to succeed to the editorial chair. His first novel, *Aspen Court*, was published in 1855. It was followed by *The Gordian Knot* (1860), *The Silver Cord* (1861), and *Sooner or Later* (1868). Brooks had an astonishing memory, was brilliant as an epigrammatist, was a great reader and a most genial companion.

See G. S. Layard, *A Great "Punch" Editor: Being the Life, Letters and Diaries of Shirley Brooks* (1907).

**BROOKS, PHILLIPS** (1835-1893), American clergyman and author, was born in Boston (Mass.) Dec. 13, 1835. Through his father, William Gray Brooks, he was descended from the Rev. John Cotton; through his mother, Mary Ann Phillips, a woman of rare force of character and religious faith, he was a great-grandson of the founder of Phillips academy, Andover (Mass.). Of the six sons, four entered the ministry of the Protestant Episcopal Church. Phillips Brooks prepared for college at the Boston Latin school and graduated at Harvard in 1855. After a short and unpleasant experience as a teacher in the Boston Latin school, he began to study for the ministry in the theological seminary at Alexandria (Va.), where he did some teaching in the preparatory department. In 1859 he was ordained deacon and became rector of the church of the Advent, Philadelphia. In 1860 he was ordained priest, and in 1862 he became rector of the church of the Holy Trinity, Philadelphia. During the Civil War he upheld with nobility and power the cause of the North and the negro. In 1869 he was made rector of Trinity church, Boston, where he preached Sunday after Sunday to great congregations, until he was consecrated bishop of Massachusetts in 1891. Although he felt compelled to decline the professorship of Christian ethics at Harvard, he was for many years an overseer and preacher of the university, his influence upon the religious life of the students being deep and wide. After a brief but great episcopate of 15 months, he died, unmarried, Jan. 23, 1893. Phillips Brooks was a tall, well proportioned man of fine physique. In character he was pure, simple, endowed with excellent judgment and a keen sense of humour, and quick to respond to any call for sympathy. When kindled by his subject it seemed to take possession of him and pour itself out with overwhelming speed of utterance and richness of metaphor. His sympathy with men of other ways and thought, and with the truth in other ecclesiastical systems, gained for him the confidence and affection of men of varied habits of mind and religious traditions, and was thus a great factor in gaining increasing support for the Episcopal Church. His various volumes of sermons were widely read as were the Bohlen lectures on "The Influence of Jesus" (1879). He was the author also of some verse including the favourite Christmas hymn, "O Little Town of Bethlehem."

PHILLIPS BROOKS, THE CLERGYMAN  
WHOSE CIVIL WAR ELOQUENCE  
WON MANY ADMIRERS

The best biography is by A. V. G. Allen (1900 condensed ed., 1907). M. C. Ayres, M. A. D. Howe and W. Lawrence are the authors

of shorter monographs. See also Lyman Abbott *Silhouettes of My Contemporaries* (1921); L. O. Brastow *Representative Modern Preachers* (1904); H. C. Potter *Reminiscences of Bishops and Archbishops* (1906); and L. P. Powell *Heavenly Heretics* (1909).

**BROOKS, WILLIAM KEITH** (1848-1908), American zoologist, was born in Cleveland, O., on March 25, 1848. He graduated at Williams college in 1870 and later studied with Louis Agassiz (q.v.) at Harvard University (Ph.D., 1875). In 1876 he was made associate in Natural history at Johns Hopkins university, where he became professor of animal morphology in 1891, head of the biological laboratory in 1893 and also professor of zoology. He established a marine laboratory and made extensive and valuable researches on the morphology of various groups of marine animals, especially the tunicates, crustaceans and the oyster. As one of the ablest of American investigators, he exercised marked influence upon the biological thought and teaching of his time. Among his more important works are *Provisional Hypothesis of Pangenesis* (1877), *Heredity* (1883), *Monograph of the Genus Salpa* (1893), *Foundations of Zoology* (1899-1907), and a popular book on *The Oyster* (1891). He died at Baltimore, Md., on Nov. 12, 1908.

**BROOM** (*Cytisus scoparius*), a shrub of the pea family (Leguminosae) native to the temperate parts of Europe and

BROOM (CYTISUS SCOPARIUS), A  
EUROPEAN PLANT THAT HAS SMALL  
LEAVES AND YELLOW FLOWERS

- A. Pod split open
- B. Standard petal
- C. Flower with petals removed
- D. Pistil
- E. One of the two keel petals
- F. Lateral petal, or wing

Asia, found widely in Great Britain, and naturalized in North America. The leaves are small and their function is shared by the green stems. The bright yellow flowers scatter their pollen by an explosive mechanism; the weight of a bee alighting on the flower causes the keel to split and the pollen to be shot out on to the insect's body. When ripe the black pods explode with a sudden twisting of the valves and scatter the seeds. The twigs have a bitter and nauseous taste and have long had a popular reputation as a diuretic; the seeds have similar properties.

"Butcher's broom," a very different plant, known botanically as *Ruscus aculeatus*, is a member of the family Liliaceae. It is a small evergreen shrub found in copses and woods, but rare in the southern half of England. The stout angular stems bear leaves reduced to small scales, which subtend flattened leaf-like branches (cladodes) with a sharp apex. The small whitish flowers are borne on the face of the cladodes; the berry is bright red.

**BROOME, WILLIAM** (1689-1745), English scholar and poet, the son of a farmer, was born at Haslington, Cheshire, where he was baptized on May 3, 1689, and died at Bath on Nov. 16, 1745. He was educated at Eton, and at St. John's college, Cambridge. He was rector of Sturston, Norfolk, and married in 1716 a fairly rich widow, Mrs. Elizabeth Clarke. When Pope undertook the translation of the *Odyssey*, he engaged Elijah Fenton and Broome to assist him. Broome translated the 2nd, 6th, 8th, 11th, 12th, 16th, 18th and 23rd books, and provided practically all the notes. He was a vain, talkative man, and did not fail to make known his real share in the translation, of which Pope had given a very misleading account in the "proposals" issued to subscribers. For the *Odyssey* Pope received £4,500, of which Broome, who had provided a third of the text and the notes, received £570. He had hoped to secure fame from his connection with Pope, and when he found that Pope had no intention of praising him he complained bitterly of being underpaid. Pope satirised him in the *Dunciad* and the *Bathos*.

Broome was also the author of some translations from Anacreon printed in the *Gentleman's Magazine*, and of *Poems on Several*

*Occasions* (1727). His poems are included in Johnson's and other collections of the British poets. His connection with Pope is exhaustively discussed in Elwin and Courthope's edition of Pope's *Works* (viii. pp. 30-186), where the correspondence between the two is reproduced.

**BROOM-RAPE** (*Orobanchae*), a genus of brown, leafless, parasitic herbs (family Orobanchaceae) growing attached to the roots of other plants. The usually stout stem bears brownish scales, and ends in a spike of yellow, reddish-brown or purplish flowers, with a gaping two-lipped corolla. Seven species occur in the British Isles; the largest, *Orobanchae major*, is parasitic on roots of shrubby leguminous plants, and has a stout stem 1 to 2 ft. high. *O. minor* is sometimes troublesome on clover crops. There are about 90 species of broom-rape, natives of temperate and sub-tropical regions; some 15 occur in North America, 9 being found in California.

**BROQUEVILLE, CHARLES MARIE PIERRE ALBERT**, COMTE DE (1860- ), Belgian politician, was born at Moll, Belgium, Dec. 4, 1860. From 1892 to 1919 he was Catholic deputy for Turnhout, Limbourg. From 1910-12 he was minister of railways, posts and telegraphs, and he became prime minister on June 18, 1911. After the elections of 1912 he formed a new cabinet, in which he acted as minister of war until Aug. 1917. He introduced an army bill, making general service personal and obligatory, which became law in 1913. In 1914 de Broqueville was responsible for the mobilization of the Belgian army. While at Havre, after the battle of Yser, he undertook the reorganization of the army and established munition factories.

In consequence of the peace proposals emanating from Prince Sixte de Bourbon and the emissaries of von der Lancken, the German civil representative in Brussels, in 1917 de Broqueville handed in his resignation as head of the cabinet. In 1917 he became foreign minister, afterwards acting as minister of reconstruction until May 1918. He became a minister of state on May 31, 1918, and was minister of the interior in M. Delacroix's cabinet from Nov. of that year until Nov. 1919, when he resigned from the Chamber of Representatives and was elected senator for the province of Namur.

**BROSCH, MORITZ** (1829-1907), German historian, was born at Prague April 7 1829, and died July 14 1907, at Venice, where he had resided for over 30 years. To the series *Geschichte der europäischen Staaten* Brosch contributed *England 1509-1850* (Gotha, 1884-99), a continuation of the work of J. M. Lappenberg and R. Pauli, and *Der Kirchenstaat* (Gotha, 1880-82). Other works on English history are *Lord Bolingbroke und die Whigs und Tories seiner Zeit* (Frankfurt, 1883), and *Oliver Cromwell und die puritanische Revolution* (Frankfurt, 1886).

See A. W. Ward in the *English Historical Review*, vol. xxii. (1907).

**BROSCHI, CARLO**: see FARINELLI.

**BROSELEY**, industrial town, Shropshire, England, in the municipal borough of Wenlock (*q.v.*), standing high above the River Severn. Pop. of parish (1921) 3,037. It was once important for its collieries and iron furnaces, including those of the famous Wilkinson; and for its clay tobacco pipes. The chief industries are now the manufacture of bricks, tiles and earthenware. The early name of the settlement (12th century) was Burwardsley. It grew in the 18th century as one of the first centres of iron smelting, exporting much of its output by way of the Severn.

**BROSSES, CHARLES DE** (1709-1777), French magistrate and scholar, was born at Dijon. After a visit to Italy in 1739 he published his *Lettres sur l'état actuel de la ville souterraine d'Herculée* (Dijon, 1750), the first work upon the ruins of Herculanum. It was during this tour that he wrote his famous letters on Italy, posthumously published in 1799 (better edition by Poulet-Malassis, *Lettres familières*, 1858). At the request of his friend Bufon, he undertook his *Histoire des navigations aux terres australes* (1756). In this work de Brosse first laid down the geographical divisions of Australasia and Polynesia, which were adopted by succeeding geographers. In 1765 appeared his work on the origin of language, *Traité de la formation mécanique des langues*. De Brosse had been occupied, during a great part of his life, on a translation of Sallust, and in 1777 he published *L'Histoire*

*du septième siècle de la république romaine*, to which is prefixed a learned life of Sallust. De Brosse was first president of the parliament of Burgundy.

**BIBLIOGRAPHY.**—See H. Mamet, *Le Président de Brosse, sa vie et ses ouvrages* (Lille, 1874); also Cunisset-Carnot, "La Querelle de Voltaire et du président de Brosse," in the *Revue des Deux Mondes* (Feb. 15 1888).

**BROTHER**, a male person in his relation to the other children of the same father and mother. The word is common to the Indo-European language, *cf.* Ger. *bruder*, Dan. and Swed. *broder*, Lat. *frater*. The Sanskrit word is *bhrātā*, and the ultimate Indo-European root is generally taken to be *bhar*, to bear. "Brother" has often been loosely used of kinsmen generally, also for fictitious relationships, *e.g.*, "blood-brothers," through a sacramental rite of mutual blood-tasting, "foster-brothers," because suckled by the same nurse. "Brethren" is the name given to members of the Church, and in a narrower sense to members of a religious confraternity. Hence it is used also in fraternal societies, *e.g.*, the Freemasons. Sovereigns address one another as "brother" to imply equality.

**BROTHER JONATHAN**, a sobriquet or nickname for the United States; similar to Uncle Sam and to John Bull for England. It is popularly, but doubtfully, derived from Jonathan Trumbull, Governor of Connecticut during the whole of the Revolutionary War. He was a valued friend of Washington and his advice was highly regarded. When in doubt or in a position of exceptional difficulty, or in great need of supplies, Washington is reputed to have exclaimed, "We must consult Brother Jonathan," meaning Governor Trumbull. The term gradually spread as a popular name for the United States, but was never in so universal use as Uncle Sam and of late years has gradually become much less common.

**BROTHERS, RICHARD** (1757-1824), religious fanatic, was born in Newfoundland on Christmas day, 1757, and educated at Woolwich. He was a naval officer, and retired on half-pay in 1789. In 1791 he renounced his half-pay for conscientious reasons, and fell into considerable straits. In 1793 he declared himself the apostle of a new religion "the nephew of the Almighty, and prince of the Hebrews, appointed to lead them to the land of Canaan." At the end of 1794 he began to print his interpretations of prophecy, his first book being *A Revealed Knowledge of the Prophecies and Times*. For prophesying the death of the king and the end of the monarchy, he was arrested in 1795, and confined as a criminal lunatic. His case was brought before Parliament by Nathaniel Halhed, the orientalist, and he was removed to a private asylum in Islington. Here he wrote prophetic pamphlets which gained him many believers, amongst them William Sharp, the engraver, who afterwards deserted him for Joanna Southcott. He died in London on Jan. 25 1824, in the house of John Finlayson, who had secured his release. The supporters of the Anglo-Israelite theory claim him as the first writer on their side.

**BROTHERS OF COMMON LIFE**, a religious community formerly existing in the Catholic Church. Towards the end of his career Gerhard Groot (*q.v.*) retired to his native town of Deventer, in the diocese of Utrecht, and with the assistance of his friend Florentius Radewyn, who resigned for the purpose a canonry at Utrecht, succeeded in carrying out a long-cherished idea of establishing a house wherein devout men might live in community without the monastic vows. The first such community was established at Deventer in the house of Florentius himself (*c.* 1380); and Thomas à Kempis lived in it from 1392 to 1399. Other houses of the Brothers of Common Life were in rapid succession established in the chief cities of the Low Countries and north and central Germany.

The ground-idea was to reproduce the life of the first Christians as described in Acts iv. The members took no vows and were free to leave when they chose; but so long as they remained they were bound to observe chastity, to practice personal poverty, putting all their money and earnings into the common fund, to obey the rules of the house and the commands of the rector, and to exercise themselves in self-denial, humility and piety. The rector was chosen by the community and was not necessarily a priest,

though in each house there were a few priests and clerics. The majority, however, were laymen, of all kinds and degrees—nobles, artisans, scholars, students, labouring men. After the religious services of the morning the Brothers scattered for the day's work. The clerics preached and instructed the people, working chiefly among the poor; they also devoted themselves to the copying of manuscripts, in order thereby to earn something for the common fund; and some of them taught in the schools. Of the laymen, the educated copied manuscripts, the others worked at various handicrafts or at agriculture, going to the workshops in the city, or to the fields—for the idea was to live and work in the world, and not be separated from it, like the monks. Their rule was that they had to earn their livelihood, and must not beg. This feature seemed a reflection on the mendicant orders, and the idea of a community life without vows and not in isolation from everyday life, was looked upon as something new and strange. Opposition arose, and the status of the order was not finally settled until the council of Constance (1414), when their cause was triumphantly defended by Pierre d'Ailly and Gerson. For a century after this the order flourished exceedingly, and its influence on the revival of religion in the Netherlands and north Germany in the 15th century was wide and deep. During the second half of the 16th century the order gradually declined, and by the middle of the 17th all its houses had ceased to exist.

**AUTHORITIES.**—The chief authorities are Thomas à Kempis, *Lives of Groot and his Disciples* and *Chronicle of Mount St. Agnes* (both works translated by J. P. Arthur, the former under the title *Founders of the New Devotion*, 1905). An excellent article in Herzog-Hauck, *Realencyklopädie* (3rd ed.), "Brüder des gemeinsamen Lebens," supplies copious information with references to all the literature.

**BROUGH, ROBERT** (1872–1905), British painter, born at Invergordon, Ross-shire, Scotland. After two years in Paris under J. P. Laurens and Benjamin-Constant at Julian's atelier, he settled in Aberdeen in 1894 as a portrait painter and political cartoonist. A portrait of Mr. W. D. Ross first drew attention to his talent in 1896, and in the following year he scored a marked success at the Royal Academy with his "Fantasie en Folie," now at the National Gallery of British Art (Tate Gallery). Two of his paintings, "Twist Sun and Moon" and "Childhood of St. Anne of Brittany," are in the Venice municipal gallery. Brough's art is influenced by Raeburn and by modern French training.

**BROUGHAM, JOHN** (1814–1880), British actor, was born in Dublin on May 9 1814 and died in New York on June 7 1880. He made his first appearance on the London stage, in 1830, at the Tottenham street theatre in *Tom and Jerry*, in which he played six characters. In 1831 he was a member of Madame Vestris's company; he remained with her as long as she retained Covent Garden, and he collaborated with Dion Boucicault in writing *London Assurance*, Dazzle being one of his best parts. In 1840 he managed the Lyceum theatre, for which he wrote several light burlesques, but in 1842 he moved to the United States, where he joined W. E. Burton's company. Later he managed various theatres, not always with financial success, and in 1860 he returned to London, where he adapted or wrote several plays, including *The Duke's Motto* for Fechter. After the Civil War he returned to New York. Brougham's theatre was opened in 1869 with his comedy *Better Late than Never*, but this proved a loss and he took to playing with various stock companies. His last appearance was in 1879 as O'Reilly, the detective, in Boucicault's *Rescued*. Brougham was the author of nearly 100 plays, most of them now forgotten. Brougham is said to have been the original of Harry Lorrequer in Charles Lever's novel.

**BROUGHAM**, a four-wheeled closed carriage, seating two or more persons, and drawn by a single horse or pair, or propelled by motor. The modern "brougham" has developed and taken its name from the "odd little kind of garden-chair" described by Thomas Moore, which the first Lord Brougham had made by a coachmaker to his own design.

**BROUGHAM AND VAUX** (brōm vō), **HENRY PETER BROUGHAM**, 1ST BARON (1778–1868), lord chancellor of England, was born at Edinburgh, Sept. 10, 1778, the eldest son of Henry Brougham and Eleanor, daughter of the Rev. James Syme. He was educated at Edinburgh high school

and at Edinburgh university, and was still a student when two papers of his on light were printed (1796 and 1797) in the transactions of the Royal Society; in 1803 he became F.R.S. But his pursuit of physical science was by way of recreation. He attended lectures in civil law, and adopted law as a profession, being admitted to the faculty of advocates in 1800. He at once went on the southern circuit, where he defended or prosecuted a few prisoners, and caused some scandal by playing a series of tricks on the presiding judge, Lord Eskgrove. The Scottish bar, however did not offer sufficient scope for his talents and his ambition. He had already appeared as junior counsel in a Scottish appeal to the House of Lords when, in 1803, he entered at Lincoln's Inn. In 1808 he was called to the English bar. In the meantime he began to write for the *Edinburgh Review* (founded in 1802), to which he contributed an extraordinary number of articles on science, politics, colonial policy, literature, poetry, surgery, mathematics and the fine arts. The prodigious success of the *Review*, and the power he was known to wield in it, brought him the friendship of Lord Grey and the leading Whig politicians. It was chiefly through his influence that the *Review* afterwards supported the Whig cause, and gave occasion for the founding of the *Tory Quarterly*. His wit and gaiety made him a social success in London. He now began his *Enquiry into the Colonial Policy of the European Powers* (Edinburgh 1803), with the idea of establishing himself in politics. Fox made him secretary to a mission (1806) headed by Lord Rosslyn and Lord St. Vincent to Portugal, then threatened with a French invasion. The mission lasted two or three months; Brougham came home out of humour and out of pocket; and meantime the death of Fox put an end to the hopes of the Whigs.

Brougham was disappointed by the abrupt fall of the ministry, and piqued that his Whig friends had not provided him with a seat in parliament. Nevertheless he wrote many pamphlets and articles in the Whig interest during the election of 1809, and in particular *An Enquiry into the State of the Nation at the commencement of the present administration* in which he attacked Pitt's foreign policy. But no seat was placed at his disposal, and he was too poor to contest a borough. At this time he joined the movement for the abolition of the slave-trade, and he remained through life not only faithful, but passionately attached to the cause. Indeed, one of the first measures he carried in the House of Commons was a bill to make the slave-trade felony, and as lord chancellor of England he had a part in the final measure of negro emancipation throughout the colonies. Before entering on practice at the English bar Brougham had acquired some knowledge of international law, and some experience of the prize courts. This probably led to his being retained as counsel for the Liverpool merchants who had petitioned both houses of parliament against the orders in council. Brougham conducted the enquiry at the bar of the House, and showed a remarkable mastery of the principles of economics and international law. The merchants nevertheless lost their case, and it was not until 1812, when Brougham was himself in parliament, that he resumed his attack on the orders in council, and ultimately conquered. His first legal success was the defence of John and Leigh Hunt, in 1811, on a charge of provoking a French invasion by publishing an article in the *Examiner* condemning military flogging. This trial established his reputation.

He took his seat in parliament early in 1810, as member for Camelford, a borough to which he was presented by the duke of Bedford. To prove that he could curb his already notorious impetuosity he vowed to keep silence for a month, and did so. His first speech was made in March, in condemnation of the conduct of Lord Chatham at Walcheren, and from that time he took part constantly in the debates of the House. His success was immediate, and his name was canvassed as a possible leader of the Whig Party if it returned to power. In 1812 he secured the formation of a committee to enquire into the state of trade, and obtained the repeal of the orders in council, which he maintained were hampering the trade of the country. At the election of 1812 Brougham stood for Liverpool and was defeated. The new House had a strong Tory majority. Brougham remained out of parlia-

ment during the four eventful years from 1812 to 1816, which witnessed the end of the war with France, and he did not conceal his resentment against the Whigs, though he himself admitted that they had grounds for their distrust of him, as he was "an indifferent party man."

He had been introduced in 1809 to the princess of Wales (afterwards Queen Caroline). In 1811 the princess began to consult him on her private affairs, after the rupture between the prince regent and the Whigs had become more decided. From that time, Brougham, in conjunction with Samuel Whitbread, became one of the princess's chief advisers; he was attached to her service, not so much from any liking for herself as from indignation against her husband, and probably with an appreciation of the political value of his position. She on the other hand does not seem to have reposed much trust in him, but found him useful and considered him too important a person to ignore or offend. Brougham strongly opposed her departure from England in 1814, but later, in 1820, proposed to the prime minister, without her knowledge, that she should be urged to resign her claim to the title of queen in return for an increased allowance of £50,000 a year.

In Feb. 1816 Brougham was returned to parliament for another pocket-borough, Winchelsea, in the gift of the earl of Darlington, and he instantly resumed a commanding position in the House of Commons. He defeated the proposal for the continuance of the income-tax; he advocated popular education; initiating a movement for the establishment of infant schools in London; and on the death of Romilly he took up with ardour the great work of the reform of the law. Nothing exasperated the Tory party more than the select committee which sat, with Brougham in the chair, in 1816 and the three following years, to investigate the state of education of the poor in London. But he was as far as ever from obtaining the leadership of the Whig Party, nor was he much more successful at the bar. The death of George III. suddenly changed this state of things. Queen Caroline at once, in April 1820, appointed Brougham her attorney-general, and Denman her solicitor-general, and they immediately took their rank in court accordingly; this was indeed the sole act of royal authority on the part of the unhappy queen. In July Queen Caroline came from St. Omer to England; ministers sent down to both houses of parliament the secret evidence which they had long been collecting against her; and a bill (the Bill of Pains and Penalties) was brought into the House of Lords for the deposition of the queen, and the dissolution of the king's marriage. The defence of the queen was conducted by Brougham, assisted by Denman, Lushington and Wilde, with equal courage and ability. He wound up the proceedings with a speech of extraordinary power and effect. The peroration was said to have been written and rewritten by him 17 times. On Nov. 10 the bill was carried, but the majority was so small that the ministry did not proceed with the bill in the Commons, and the result was a virtual triumph for the queen, which was shared by Brougham. A piece of plate was presented to him, paid for by a penny subscription of peasants and mechanics. He refused to accept a sum of £4,000 which the queen herself placed at his disposal, and took no more than the usual fees of counsel, while his salary as attorney-general remained unpaid, until it was discharged by the Treasury after her death. But from that time his fortune was made at the bar and his practice on the northern circuit quintupled. Even Lord Campbell, a rival advocate and an unfriendly critic, admitted that his position was unexampled in the profession. The meanness of George IV. and of Lord Eldon refused him the silk gown to which his position at the bar entitled him, and for some years he led the circuit as an outer barrister, to the great loss of the senior members of the circuit, who could only be employed against him. His practice rose to about £7,000 a year, but it was again falling off before he became chancellor.

Meanwhile he pursued his persistent advocacy of better education. The select committee of 1816 had disclosed the misuse of various charitable educational funds and had led to an act of 1818 appointing another committee of enquiry, which resulted later in the establishment of the charity commissioners. In 1820

Brougham prepared an Education Bill, which was rejected, owing chiefly to the necessity for co-operation with the Church of England. For the same reason it failed again in 1826. In 1820 he also proposed a compulsory education rate. Under his auspices the first steps were taken, in 1825, for the establishment of a university in London, free from all religious or sectarian distinctions. In 1827, he helped in founding the "Society for the Diffusion of Useful Knowledge," an association which gave an immense impulse to the production of good cheap books for the people. Its publications were issued at 6d. each and the first was an essay on "The Pleasures and Advantages of Science," written by himself. In 1832 he founded the *Penny Magazine*, and in 1833 the *Penny Cyclopaedia*, which was completed 11 years later, but finally caused the bankruptcy of the Society.

In 1828 he delivered his great speech on law reform, which lasted six hours, in a thin and exhausted house.

The death of Canning, the failure of Lord Goderich, and the accession of the duke of Wellington to power (Jan. 1828), improved the prospects of the Whig party. At the general election of 1830 Brougham was returned as M.P. for the county of York. Parliament met in November. Brougham's first act was to move for leave to bring in a bill to amend the representation of the people; but before the debate came on the Tory government was defeated on another question (Nov. 15, 1830); the duke resigned, and was succeeded by Earl Grey.

Amongst the difficulties of the new premier and the Whig party were the position and attitude of Brougham. He was not the leader of any party, and had no personal following in the House of Commons. Moreover, he himself had repeatedly declared that nothing would induce him to exchange his position as an independent member of parliament for any office, however great. On the day following the resignation of the Tory government he reluctantly consented to postpone for one week his motion on parliamentary reform. The attorney-generalship was offered to him and indignantly refused. He himself affirms that he desired to be master of the rolls, which would have left him free to sit in the House of Commons. But this was positively interdicted by the king, and objected to by Lord Althorp, who declared that he could not undertake to lead the House with so insubordinate a follower behind him. But as it was impossible to leave Brougham out of the ministry, it was determined to offer him the chancellorship. Brougham did not wish to lose his seat in the Commons, but finally yielded to the representations of Lord Grey and Lord Althorp. On Nov. 22 the great seal was delivered to him by the king, and he was raised to the peerage as Baron Brougham and Vaux. His chancellorship lasted exactly four years.

Lord Brougham took a most active and prominent part in all the great measures promoted by Grey's government, and the passing of the Reform Bill was due in a great measure to his brilliant defence in the Lords, although he was excluded from the cabinet committee of four which prepared the bill. Unfortunately Brougham's success developed his native arrogance. His manner became dictatorial and he exhibited a restless eccentricity, and a passion for interfering with every department of state, which alarmed the king. Lord Grey resigned, but very much by Brougham's exertions the cabinet was reconstructed under Lord Melbourne, and he expected that his own influence in it would be increased. But the extreme mental excitement under which he laboured at this time culminated during a journey to Scotland in a behaviour so extravagant that his fall became certain. Whether the stories circulated were true or not, it is certain that his correspondence with the king caused alarm at Windsor, and contributed to the destruction of the ministry.

Shortly after the meeting of parliament in November 1834 the king dismissed his ministers. The chancellor, who had dined at Holland house, called on Lord Melbourne on his way home, and learned the intelligence. Melbourne made him promise that he would keep it secret until the next day, but in the morning the occurrence was related in the *Times*, in a paragraph which added that "the queen had done it all." It was always supposed that Brougham gave the information to the *Times*, and this was the last act of his official life. The Peel ministry, prematurely and

of Manchester and the district, from the building of the Roman camp at Mancunium to the experimental work of Dalton in elaborating the atomic theory. Among his best works, "Christ washing St. Peter's Feet" is in the Tate Gallery, London, "The Last of England," is at Birmingham, and the "Expulsion of the Danes from Manchester," and "Work," an original cartoon for a fresco, are in the Manchester Art gallery.

Brown died in London on Oct. 6, 1893. He was twice married—in 1841 to his cousin, Elizabeth Bromley, who died in 1846, leaving a daughter, Lucy, who became the wife of William M. Rossetti; and to Emma Hill, who served as model for many of his figures.

See a life of the artist written by his grandson, Ford M. Hueffer (afterwards Ford Madox Ford), *Ford Madox Brown* (1896). This volume contains some extracts from Brown's diary, extending in the whole from 1847 to 1865; and other lengthier extracts appear in two books ed. by William M. Rossetti—*Ruskin, Rossetti, Pre-Raphaelitism* (1899) and *Pre-Raphaelite Diaries and Letters* (1899). See also the *Preferences in Art*, etc., by Harry Quilter (1892), and a pamphlet, *Ford Madox Brown* (1901), by Helen Rossetti (Angeli).

**BROWN, FRANCIS** (1849-1916), American Semitic scholar, was born in Hanover (N.H.), Dec. 26, 1849, the son of Samuel Gilman Brown (1813-85), president of Hamilton College from 1867 to 1881, and the grandson of Francis Brown (1784-1820), a president of Dartmouth involved in the famous "Dartmouth College case." The younger Francis graduated from Dartmouth and from the Union Theological Seminary and then studied in Berlin. In 1879 he became instructor in biblical philology at the Union Theological Seminary, in 1881 an associate professor, in 1890 professor of Hebrew and cognate languages and in 1908 president of the seminary. Brown's published works won him honorary degrees in both Great Britain and America; they were, with the exception of *The Christian Point of View* (1902; with Profs. A. C. McGiffert and G. W. Knox), almost purely linguistic and lexical, and include *Assyriology: its Use and Abuse in Old Testament Study* (1885), and the important revision of Gesenius, undertaken with S. R. Driver and C. A. Briggs, *A Hebrew and English Lexicon of the Old Testament* (1891-1905). In 1911 he was tried for heresy before the Presbyterian General Board but was exonerated. He died in New York on Oct. 15, 1916.

**BROWN, GEORGE** (1818-1880), Canadian journalist and statesman, was born in Edinburgh, Scotland, on Nov. 29, 1818, and was educated in his native city. With his father, Peter Brown (d. 1863), he emigrated to New York in 1838; and in 1843 they removed to Toronto and began the publication of *The Banner*, a politico-religious paper in support of the newly formed Free Church of Scotland. In 1844 he began, independently of his father, the issue of the *Toronto Globe*. This paper, at first weekly, became in 1853 a daily, and through the ability and energy of Brown came to possess an almost tyrannical influence over the political opinion of Ontario. In 1851 he entered the Canadian parliament as member for Kent county. Brown's repeated violent attacks upon the Roman Catholic Church and on the supposed domination in parliament of the French Canadian section made him very unpopular in lower Canada, but in upper Canada his power was great. Largely owing to his attacks, the clergy reserves were secularized in 1854. He championed the complete laicization of the schools in Ontario, but unsuccessfully, the Roman Catholic Church maintaining its right to separate schools. He also fought for the representation by population of the two provinces in parliament, the Act of Union (1841) having granted an equal number of representatives to each. This principle of "rep. by pop." was conceded by the British North America act (1867).

He was one of the earliest advocates of a federation of the British colonies in North America, and in 1864, to accomplish this end, entered into a coalition with his bitter personal and political opponent, Mr. (afterwards Sir) John A. Macdonald. Largely owing to Brown's efforts, Federation was carried through the House, but on Dec. 21 1865, he resigned from the Coalition government, though continuing to support its Federation policy, and in 1867 he was defeated in south Ontario and never again sat in the House. In great measure owing to his remarkable energy, the north-west territories were purchased by the new dominion.

In Dec. 1873 he was called to the Canadian senate, and in 1874 was appointed by the imperial government joint plenipotentiary with Sir Edward Thornton to negotiate a reciprocity treaty between Canada and the United States. The negotiations were successful, but the draft treaty failed to pass the United States Senate. Soon afterwards Brown refused the lieutenant-governorship of Ontario, and on two subsequent occasions the offer of knighthood, devoting himself to the *Globe*. On March 25 1880, he was shot by a discharged employee and died on May 9.

See J. C. Dent, *Canadian Portrait Gallery* (Toronto, 1880). The official *Life*, by the Hon. Alexander Mackenzie, is decidedly partisan. A life by John Lewis is included in the *Makers of Canada* series (Toronto). (W. L. G.)

**BROWN, HENRY KIRKE** (1814-1886), American sculptor, was born in Leyden (Mass.) on Feb. 24, 1814. He began to paint portraits while a boy, studied painting in Boston under Chester Harding, learned a little about modelling, and in 1836-39 spent his summers working as a railroad engineer to earn enough to study further. He spent four years (1842-46) in Italy; but returning to New York he remained distinctively American, and was never dominated, as were so many of the early American sculptors, by Italian influence. He died on July 10, 1886, at Newburgh (N.Y.). His equestrian statues are excellent, notably that of Gen. Winfield Scott (1874) in Washington, D.C., and one of George Washington (1856) in Union square, New York city, which was the second equestrian statue made in the United States. Brown was one of the first in America to cast his own bronzes. Among his other works are: Abraham Lincoln (Union square, New York city); Nathanael Greene, George Clinton, Philip Kearny and Richard Stockton (all in the National Statuary hall of the Capitol, Washington, D.C.); De Witt Clinton and "The Angel of the Resurrection," both in Greenwood cemetery, New York city; and an "Aboriginal Hunter."

His nephew and pupil, HENRY KIRKE BUSH-BROWN (1857- ), also became prominent among American sculptors, his "Buffalo Hunt," equestrian statues of Generals Meade and Reynolds at Gettysburg, and "Justinian" in the New York appellate courthouse, being his chief works. He has completed a portrait-bust of Henry Kirke Brown for the Hall of Fame of New York university.

**BROWN, JACOB** (1775-1828), American soldier, was born of Quaker ancestry, in Bucks county, Pa., on May 9, 1775. From 1796 to 1798 he was engaged in surveying public lands in Ohio; in 1798 he settled in New York city and during the period 1798-1800, when war with France seemed imminent, he acted as military secretary to Alexander Hamilton, then inspector general of the United States army. Subsequently he purchased a large tract of land in Jefferson county, N.Y., where he founded the town of Brownville. There he served as county judge, and attained the rank (1810) of brigadier general in the State militia. On the outbreak of the second war with Great Britain (1812) he was placed in command of the New York State frontier from Oswego to Lake St. Francis (near Cornwall, Ont.), and repelled the British attacks on Ogdensburg (Oct. 4, 1812) and Sackett's Harbor (May 29, 1813). In July 1813, he was commissioned brigadier general in the regular army, and in Jan. 1814, he was promoted major general and succeeded Gen. James Wilkinson in command of the forces at Niagara. Early in the summer of 1814 he undertook offensive operations, and his forces occupied Ft. Erie, and, on July 5, at Chippawa, Ont., defeated the British under Gen. Phineas Riall. On July 25, with Gen. Winfield Scott, he fought a hotly contested, but indecisive, battle with the British under Gen. Gordon Drummond (1771-1854), at Lundy's Lane, where he was twice wounded. After the war he remained in the army, of which he was the commanding general from March, 1821, until his death at Washington, D.C., on Feb. 24, 1828.

**BROWN, JOHN** (1715-1766), British divine and author, was born at Rothbury, Northumberland, on Nov. 5, 1715, and was educated at St. John's college, Cambridge. He was senior wrangler in 1735, took holy orders, and was appointed minor canon and lecturer at Carlisle. His poem, entitled "Honour" (1743), was followed by the "Essay on Satire" which gained for

him the friendship of William Warburton. In 1751 he wrote his *Essay on the Characteristics of Lord Shaftesbury*, containing an able defence of the utilitarian philosophy. In 1756 he received the living of Great Horkesley, in Essex. He was the author of two plays, *Barbarossa* (1754) and *Athelstane* (1756); Garrick played in both, and the first was a success. The most popular of his works was the *Estimate of the Manners and Principles of the Times* (1757-58), a bitter satire which pleased a public depressed by the ill-success in the conduct of the war. Other works are the *Additional Dialogue of the Dead between Pericles and Cosmo* . . . (1760), in vindication of Chatham's policy; and the *Dissertation on the Rise, Union and Power, etc., of Poetry and Music* (1763). Invited by Catherine II. of Russia to advise her on education, he prepared for the journey but relinquished the design on account of his gout. He committed suicide on Sept. 23, 1766.

There is a detailed account of John Brown by Andrew Kippis in *Biographia Britannica* (1780). See also T. Davies, *Memoirs of . . . David Garrick* (1780), chap. xix.

**BROWN, JOHN** (1735-1788), Scottish physician, was born in 1735 at Lintlaws or at Preston, Berwickshire. As a student at Edinburgh he soon attracted the notice of William Cullen, who treated him in some respects as an assistant professor. In time, however, he quarrelled with Cullen, as with the professors of the university in general, and from about 1778 his public lectures contained vigorous attacks on all preceding systems of medicine and Cullen's in particular. In his *Elementa Medicinæ* (1780), he expounds his own, or as it was then called the Brunonian, theory of medicine. In 1786 he settled in London, and died there on Oct. 17, 1788.

An edition of his works, with notice of his life by his son, William Cullen Brown, appeared in 1804.

**BROWN, JOHN** (1784-1858), Scottish divine, was born at Whitburn, Linlithgow, on July 12 1784, and died at Edinburgh on Oct. 13 1858. He belonged to the "Burgher" section of the "Secession" church, and held successively pastorates at Biggar, Lanarkshire (1806), Rose street (1822) and Broughton place, Edinburgh (1829). His most important work was done as professor in the theological hall of the Secession church, where he taught the exegetical method of the exposition of Scripture.

The part he took in the discussion on the atonement, which agitated all the Scottish churches, led to a formal charge of heresy against him by those who held the doctrine of a limited atonement. In 1845, after a protracted trial, he was acquitted by the synod. From that time he enjoyed the thorough confidence of his denomination (after 1847 merged in "the United Presbyterian Church").

See *Memoir of John Brown, D.D.*, by John Cairns (1860).

**BROWN, JOHN** (1800-1859), American abolitionist, leader of the famous attack upon Harper's Ferry, in 1859, was born on May 9, 1800, at Torrington, Connecticut. He is said to have been descended from Peter Brown, who went to America in the *Mayflower*, and he was the grandson of Capt. John Brown, who served in the War of Independence. He was taken by his father, Owen Brown, to Hudson, O., in 1805. At the age of 18 he began to prepare himself for the Congregational ministry, but soon changed his mind and turned his attention to land surveying. He engaged successively in the tanning business, in sheep-raising, and in the wool trade, but met with small reward and in 1842, at Akron, O., became bankrupt. In 1849, after having lived in Ohio, Pennsylvania and Massachusetts, he removed to North Elba, N.Y., where he engaged in farming on part of the land which was being given in small tracts, by its owner, Gerrit Smith, to negro settlers. Long before this he had conceived a strong hatred for the institution of slavery, and had determined to do what he could to bring about its destruction.

In 1854 five of his sons removed to Kansas, where the violent conflict was beginning between the "free-state" and the pro-slavery settlers, and in the following year Brown, leaving the rest of his family at North Elba, joined them, settling near Osawatimie and immediately becoming a conspicuous figure in the border warfare. His name became particularly well known in connection with the so-called "Pottawatomie massacre," the killing in cold blood,

on May 25, 1856, by men under his orders, of five pro-slavery settlers in retaliation for the murder a short time previously of five "free-state" settlers. He also, on June 2, at the head of about 30 men, captured Capt. H. C. Pate and 22 pro-slavery men at Black Jack, and on Aug. 30, 1856, with a small body of supporters, vigorously resisted an attack of a superior pro-slavery force upon Osawatimie. Brown then visited the Eastern States for the purpose of raising money to be used in the Kansas struggle and of arousing the people against slavery. After spending a short time in Kansas, in 1858-59 he proceeded to carry out a long-cherished scheme for facilitating the escape of fugitive slaves by establishing in the mountains of Virginia a stronghold in which such fugitives could take refuge and defend themselves against their pursuers. At Chatham, Canada, with 11 white and 35 negro associates, he adopted a "Provisional constitution and ordinance for the people of the United States." Brown was elected commander-in-chief, and from among this group a secretary of state, a secretary of war, a secretary of the treasury, and members of Congress were chosen.

Later, with only 22 men supplied with arms furnished by the Massachusetts-Kansas committee, and with funds contributed (in ignorance of Brown's plans) by his intimate associates, Theodore Parker, George L. Stearns, T. W. Higginson, and F. B. Sanborn, all of Boston, and Gerrit Smith, of Peterboro, N.Y., he removed to a farm near Harper's Ferry, the site of a Federal arsenal, which he intended to capture as a preliminary to the carrying out of the main part of his plan. On the night of Oct. 16, 1859, with only 18 men, five of whom were negroes, he made the attack, easily capturing the arsenal and taking about 60 of the leading citizens prisoners to be used as hostages. On the following morning Brown and his followers were vigorously attacked, and on the 18th—a small force of United States marines under Colonel Robert E. Lee having arrived—were overpowered, Brown being seriously wounded after he had surrendered. Of the 22 men who had participated in the raid, 10 were killed, seven were taken prisoners, and five escaped. On the other side five were killed and nine wounded. Brown was committed to the Charlestown, Va. (now W.Va.), gaol on Oct. 19; on the 27th his trial began; on the 31st he was convicted of "treason, and conspiring and advising with slaves and other rebels, and murder in the first degree"; and on Dec. 2. he was hanged at Charlestown. His fellow-prisoners were likewise hanged soon afterwards. Brown was buried at North Elba, New York. The attack upon Harper's Ferry created widespread excitement, particularly in the Southern States; and among the abolitionists in the North Brown was looked upon as a martyr to their cause. Shortly after his death a famous popular song became widely current in the North beginning:

John Brown's body lies a-mouldering in the grave,  
But his soul goes marching on.

Intensely religious in his nature, Brown possessed something of the gloomy fanaticism of his Puritan ancestors. The secret of his whole career lies in his emphatic conviction, to use the words of Wendell Phillips, that he had "letters of marque from God"; that he had a Divine commission to destroy slavery by violent means. He scouted the "milk and water principles" of the milder abolitionists, advocated vigorous resistance to the slave power, and expressed his ideas by actions rather than by words. It now seems that this policy aided very little in making Kansas a free State, and that the attack on Harper's Ferry, while creating much feeling at the moment, had very little effect on the subsequent course of events.

Brown was twice married and was the father of 20 children, eight of whom died in early childhood. His sons aided him in all his undertakings, two of them being killed at Harper's Ferry.

See life (new ed. 1929) by O. G. Villard; F. B. Sanborn's *Life and Letters of John Brown* (Boston, 1885); R. J. Hinton's *John Brown and His Men* (1894); James Redpath's *Public Life of Captain John Brown* (Boston, 1860); Von Holst's essay, *John Brown* (Boston, 1889); and J. F. Rhodes, *History of the United States from the Compromise of 1850* (1890-1906); R. P. Warren, *John Brown* (1929).

**BROWN, JOHN** (1810-1882), Scottish physician and author, son of John Brown (1784-1858), was born at Biggar, Scotland, on Sept. 22, 1810. The two volumes of his essays, *Horæ Subsecivæ* (i.e., "leisure hours") (1858, 1861), *John Leech and*

*other Papers* (1882), *Rab and His Friends* (1859), and *Marjorie Fleming: a Sketch* (1863), were enormously popular in their day. The first volume of *Horae Subsecivae* deals chiefly with the equipment and duties of a physician, the second with subjects outside his profession. He died on May 11, 1882.

See E. T. McLaren, *Dr. John Brown and his Sister Isabella* (4th ed., 1890); and *Letters of Dr. John Brown*, edited by his son and D. W. Forrest, with biography by E. T. McLaren (1907).

**BROWN, SIR JOHN** (1816-1896), English armour-plate manufacturer, was born at Sheffield on Dec. 6 1816, the son of a slater. He was apprenticed to a Sheffield firm who manufactured files and table cutlery. Brown invented in 1848 the conical steel spring buffer for railway wagons, and in 1860, after seeing the French ship "La Gloire" armoured with hammered plate, he determined to attempt the production of armour for the British Navy by a rolling process. The experiment was successful, and led to admiralty orders for armour plate sufficient to protect about three-quarters of the navy. In 1856 Brown had started the Atlas works in Sheffield, which covered 30 acres and employed eventually more than 4,000 workmen. Besides supplying iron to the Sheffield steel trade, Brown himself successfully developed the Bessemer process. He died at Bromley, Kent, on Dec. 27, 1896.

**BROWN, JOHN GEORGE** (1831-1913), American painter, was born in Durham, England, Nov. 11, 1831. He studied at Newcastle-on-Tyne, at Edinburgh academy, and after removing to New York city in 1853, at the schools of the National Academy of Design, of which he afterwards became a member. In 1866 he became one of the charter members of the Water-Colour Society, of which he was president from 1887 to 1904. He generally confined himself to representations of street child life, bootblacks, newsboys, etc.; his "Passing Show" (Paris Salon, 1877) and "Street Boys at Play" (Paris Exhibition, 1900) are good examples of his popular talent. He died in New York city, Feb. 8, 1913.

**BROWN, ROBERT** (1773-1858), British botanist, was born on Dec. 21 1773 at Montrose, and was educated at the grammar school of his native town, where he had as contemporaries Joseph Hume and James Mill. In 1787 he entered Marischal college, Aberdeen, but two years afterwards removed to Edinburgh university. In the year 1801 he was offered the post of naturalist to the expedition fitted out under Capt. Matthew Flinders for the survey of the then almost unknown coasts of Australia. In 1805 the expedition returned to England, having obtained, among other acquisitions, nearly 4,000 species of plants, many of which were new. Brown was almost immediately appointed librarian of the Linnean Society. In 1810 he published the first volume of his great work, in Latin, the *Prodromus Florae Novae Hollandiae et Insulae Van Diemen*, which did much to further the general adoption of A. L. de Jussieu's natural system of plant classification. With the exception of a supplement published in 1830, no more of the work appeared. In 1810 Brown became librarian to Sir Joseph Banks, who on his death in 1820 bequeathed to him the use and enjoyment of his library and collections for life. In 1827 an arrangement was made by which these were transferred to the British Museum, with Brown's consent and in accordance with Sir Joseph's will. Brown then became keeper of this new botanical department, an office which he held until his death on June 10 1858, in Soho square, London.

In 1825-34 his works up to that date were collected and published in four divisions by Nees von Esenbeck, in German, under the title of *Vermischte botanische Schriften* (Leipzig and Nuremberg). In 1866 the Ray Society reprinted his complete writings, the *Prodromus* alone excepted.

**BROWN, SAMUEL MORISON** (1817-1856), Scottish chemist, poet and essayist, born at Haddington on Feb. 23, 1817, studied at Edinburgh, Berlin and St. Petersburg. In 1850 he published a tragedy, *Galileo Galilei*, and two volumes of his *Lectures on the Atomic Theory and Essays Scientific and Literary* appeared in 1858, with a preface by his kinsman Dr. John Brown, the author of *Horae Subsecivae*. He died at Edinburgh on Sept. 20, 1856.

**BROWN, THOMAS** (1663-1704), English satirist, of "facetious memory" as Addison designates him, was born at

Shifnal, in Shropshire, and was entered, in 1678, at Christ Church, Oxford, where he is said to have escaped expulsion by the famous lines beginning, "I do not love thee, Dr. Fell." He was for three years schoolmaster at Kingston-on-Thames, and afterwards settled in London. Under the pseudonym of Dudley Tomkinson he wrote a satire on Dryden, *The Reasons of Mr. Bays changing his Religion: considered in a Dialogue between Crites, Eugenius and Mr. Bays*, with two other parts having separate titles (1688-90, republished with additions in 1691). He was the author of a great variety of poems, letters, dialogues and lampoons. He died June 16, 1704.

His collected works were published in 1707-08. The second volume contains a collection of *Letters from the Dead to the Living*, some of which are translated from the French. His *Comical Romance done into English* (1772, the *Roman Comique* of Scarron) was reprinted in 1892.

**BROWN, THOMAS** (1778-1820), Scottish philosopher, was born at Kirkcubrecht and educated in London and afterwards at Edinburgh university, where he attended Dugald Stewart's moral philosophy class. Later he turned to law, but in 1798 he settled on a medical course and in the same year produced his criticism of Darwin's *Zoonomia*. In the second number of the *Edinburgh Review*, to which he now began to contribute, appeared his criticism of the Kantian philosophy, based entirely on Villier's French account. His philosophical ability was further exhibited on the occasion of the clerical opposition to the appointment of Sir John Leslie, a follower of Hume, to the mathematical professorship (1805), for Brown undertook to defend Hume's doctrine of causality as in no way inimical to religion. His defence became in its third edition a lengthy treatise entitled *Inquiry into the Relation of Cause and Effect*. In 1806 he became a medical practitioner in partnership with James Gregory, but, though successful in his profession, preferred literature and philosophy. After twice losing a professorship in the university, he was invited, during an illness of Dugald Stewart in the session of 1808-09, to act as his substitute, and during the following session he undertook a great part of Stewart's work, being appointed in 1810 as colleague to Stewart, a position which he held for the rest of his life.

His friend and biographer, David Welsh, superintended the publication of his text-book, the *Physiology of the Human Mind*, and his successors, John Stewart and the Rev. E. Milroy, published his *Lectures on the Philosophy of the Human Mind*. The latter reached its 19th edition. Among Brown's many poems, which are modelled on Pope and Akenside and rather commonplace, may be mentioned: *Paradise of Coquettes* (1814); *Wanderer in Norway* (1815); *Warfiend* (1816); *Bower of Spring* (1817); *Agnes* (1818); *Emily* (1819); a collected edition appeared in 1820.

Brown's philosophy occupies an intermediate place between the earlier Scottish school and the later analytical or associational psychology. He retains a certain number of intuitive beliefs, which enables him to claim that our acknowledgment of cause and effect is not derived from experience and that mind and matter are sharply distinguished. On the other hand, he approaches sensationalism in his assertions that in perception we look immediately on a sensation in the mind and only reach externals by a process of inference, and that will is merely a prevailing desire. Brown's most valuable contributions include his excellent analysis of sensation, especially of touch, his eloquent exposition of the emotions, and his account of the succession of mental states.

For a severe criticism of Brown's philosophy, see Sir W. Hamilton's *Discussions and Lectures on Metaphysics*; and for a high estimate of his merits, see J. S. Mill's *Examination of Hamilton*. See also D. Welsh's *Account of the Life and Writings, etc.* (1825); M'Cosh's *Scottish Philosophy*, pp. 317-337.

**BROWN, THOMAS EDWARD** (1830-1897), British poet, scholar and divine, was born on May 5, 1830, at Douglas, Isle of Man. His father, the Rev. Robert Brown, held the living of St. Matthew's—a homely church in a poor district. His mother came of Scottish parentage, though born in the island. Thomas, the sixth of ten children, was but two years old when the family removed to Kirk Braddan vicarage, a short distance from Douglas, where his father (a scholar of no university, but so fastidious about composition that he would have some sen-

tences of an English classic read to him before answering an invitation), took share with the parish-schoolmaster in tutoring the clever boy until, at the age of 15, he was entered at King William's college. Here his abilities soon declared themselves, and hence he proceeded to Christ Church, Oxford, where his position (as a servitor) cost him much humiliation, which he remembered to the end of his life. He won a double first, however, and was elected a fellow of Oriel in April 1854, Dean Gaisford having refused to promote him to a senior studentship of his own college, on the ground that no servitor had ever before attained to that honour. Although at that time an Oriel fellowship conferred a deserved distinction, Brown never took kindly to Oxford life, and, after a few terms of private pupils, returned to the Isle of Man as vice-principal of his old school. He had been ordained deacon, but did not proceed to priest's orders for many years. In 1857 he married his cousin, Miss Stowell, daughter of Dr. Stowell of Ramsey, and shortly afterwards became headmaster of the Crypt school, Gloucester—a position which in no long time he found intolerable. From Gloucester he was summoned by the Rev. John Percival (afterwards bishop of Hereford), who had recently been appointed to the struggling young foundation of Clifton college, which he soon raised to be one of the great public schools. Percival wanted a master for the modern side, and made an appointment to meet Brown at Oxford; "and there," he writes, "as chance would have it, I met him standing at the corner of St. Mary's Entry, in a somewhat Johnsonian attitude, four-square, his hands deep in his pockets to keep himself still, and looking decidedly volcanic. We very soon came to terms, and I left him there under promise to come to Clifton as my colleague at the beginning of the following term." At Clifton Brown remained from Sept. 1863 to July 1892, when he retired—to the great regret of boys and masters alike, who had long since come to regard "T.E.B.'s" genius, and even his eccentricities, with a peculiar pride—to spend the rest of his days upon the island he had worshipped from childhood, and often celebrated in song. His poem "Betsy Lee" appeared in *Macmillan's Magazine* (April and May 1873), and was published separately in the same year. It was included in *For's'sle Yarns* (1881), which reached a second edition in 1889. This volume included at least three other notable poems "Tommy Big-eyes," "Christmas Rose," and "Captain Tom and Captain Hugh." It was followed by *The Doctor and other Poems* (1887), *The Manx Witch and other Poems* (1889), and *Old John and other Poems*—a volume mainly lyrical (1893). After his death all these and a few additional lyrics and fragments were published in one volume by Messrs. Macmillan under the title of *The Collected Poems of T. E. Brown* (1900). His familiar letters (edited in two volumes by an old friend, S. T. Irwin, in 1900) bear witness to the zest he carried back to his native country, although his thoughts often reverted to Clifton, where he died suddenly while on a visit. Brown's more important poems are narrative, and written in the Manx dialect, with a free use of pauses, and sometimes with daring irregularity of rhythm. A rugged tenderness is their most characteristic note; but the emotion, while almost equally explosive in mirth and in tears, remains an educated emotion, disciplined by a scholar's sense of language. They breathe the fervour of an island patriotism (humorously aware of its limits) and of a simple natural piety. In his lyrics he is happiest when yoking one or the other of these emotions to serve a philosophy of life, often audacious, but always genial. (A. T. Q.-C.)

**BROWN, SIR WILLIAM, BART.** (1784–1864), British merchant and banker, founder of the banking-house of Brown, Shipley & Co., was born at Ballymena, Ireland, on May 30, 1784, the son of an Irish linen-merchant. At the age of sixteen he accompanied his father and brothers to Baltimore, Maryland, U.S.A., but in 1809 left America for Liverpool. Here he established a branch of the firm, which had now begun to deal largely in raw cotton as well as linen and soon afterwards developed into one of general merchants and finally bankers. The great financial crisis of 1837 seriously threatened the ruin of the firm, but the Bank of England agreed to advance him £2,000,000 to tide matters over. Brown found it necessary to apply for only £1,000,000,

which he repaid within the next six months. His business, both mercantile and banking, continued to increase, and in 1844 he was in possession of a sixth of the trade between Great Britain and the United States. In 1856 the friction between the British and American governments due to the enlistment by British consuls of recruits for the Crimean War was largely allayed by the action of Brown, who in an interview with Lord Palmerston, then prime minister, explained the objections taken in America. From 1846 to 1859 he was Liberal M.P. for South Lancashire. In 1860 he presented Liverpool with a public library and museum, and in 1863 was made a baronet. He died at Liverpool in 1864.

See H. A. Fox Bourne's *English Merchants* (1886) and *Ceremonies connected with the opening of the free Public Library presented by William Brown to the Town of Liverpool* (Liverpool, 1861).

**BROWN, WILLIAM HARVEY** (1862–1913), American zoologist and Rhodesian pioneer, was born at Des Moines, Iowa, on Aug. 22, 1862. Following his graduation at the University of Kansas in 1887 he became a member of the zoological staff of the Smithsonian Institution at Washington and pursued further studies at Cornell and Georgetown universities. In 1889 he was naturalist on a U.S. Government eclipse expedition to the Congo region. At Cape Town in the same year he joined, as representative of the Smithsonian Institution, the original pioneer column sent by Cecil Rhodes to the region north of the Transvaal, later known as Rhodesia. After devoting four years to exploration and zoological collecting he resigned his scientific post and became a citizen of the new colony, in the early development of which he was an active figure. In the Mashona uprising of 1896 he joined the colonial forces and was severely wounded. He developed agricultural and mining properties and later served as mayor of Salisbury and as member of the legislative council. In 1899 he published *On the South African Frontier*, which contains valuable information on the early history of Rhodesia. His extensive zoological and ethnological collections are best represented in the museum at Cape Town, the National museum at Washington, the Carnegie museum at Pittsburgh, the museum of the University of Kansas and that of the New York Zoological society. He died at Salisbury on April 24, 1913.

**BROWN BESS**, a name given in the British army to the flint-lock musket with which the infantry were formerly armed. The term is applied generally to the weapon of the 18th and early 19th centuries, and became obsolete on the introduction of the rifle. The first part of the name derives from the colour of the wooden stock, for the name is found much earlier than the introduction of "browning" the barrel of muskets; "Bess" may be either a humorous feminine equivalent of the "brown-bill," the old weapon of the British infantry, or a corruption of the "buss," i.e., box, in "blunderbuss."

**BROWNE, SIR BENJAMIN CHAPMAN** (1839–1917), British engineer, was born at Stout's Hill, Glos., on Aug. 26, 1839 and was apprenticed to the Elswick works near Newcastle-on-Tyne. He became an expert on harbour work and carried out harbour works at Tynemouth, Falmouth and in the Isle of Wight. In 1870 he took over the locomotive works of R. and W. Hawthorn at Forth Banks; which in 1886 he combined with those of Andrew Leslie and Co., and until 1916 was chairman of the combination. He was knighted in 1887. He died at Westacre, Newcastle-on-Tyne, on March 1, 1917.

**BROWNE, CHARLES FARRAR:** see WARD, ARTEMUS.

**BROWNE, EDWARD GRANVILLE** (1862–1926), British orientalist, was born at Uley, Gloucestershire. Educated at Trinity college, Glenalmond, and then at Eton and Pembroke college, Cambridge, he studied medicine and oriental languages. In 1887 he was elected a fellow of his college, in the same year qualifying M.B. at St. Bartholomew's hospital, London, but he never practised as a doctor. In 1887–88 he travelled in Persia, becoming afterwards lecturer in Persian at Cambridge. In 1902 he was appointed Adams Professor of Arabic at Cambridge, a post he held until his death. Browne's published works include *A Traveller's Narrative* (1891), re-issued in 1926 under the title *A Year amongst the Persians; Literary History of Persia until the time of Firdausi* (1902), continuations of which were pub-

lished in 1906, 1920 and 1924; *The Persian Revolution, 1905-9* (1910); a translation of *Chahār Māgāla*, with notes (1921); and *Arabian Medicine* (1921).

**BROWNE, EDWARD HAROLD** (1811-1891), was born at Aylesbury, and educated at Eton and Cambridge. He was Norrisian professor of divinity at Cambridge (1854), bishop of Ely (1864), bishop of Winchester (1873). His best-known book is his *Exposition of the Thirty-Nine Articles* (vol. i. 1850, vol. ii. 1854), long a standard authority.

**BROWNE, HABLÔT KNIGHT** (1815-1882), English artist, famous as "Phiz," was born at Lambeth in humble circumstances and was early apprenticed to the eminent engraver Finden, in whose studio his only artistic education was obtained. At the age of 19 he abandoned engraving in favour of other artistic work, and a meeting with Dickens two years later determined the form which this should take. Robert Seymour, the original illustrator of *Pickwick*, had just committed suicide, and the serial publication of the book was in danger from the lack of a capable successor. Browne applied for the post, and the drawings which he submitted were preferred by Dickens to those of a rival applicant—W. M. Thackeray. His pseudonym of "Phiz" was adopted in order to harmonize with Dickens's "Boz," and it was by his work for Dickens (especially in *Pickwick*, *David Copperfield*, *Dombey and Son*, *Martin Chuzzlewit* and *Bleak House*) that his reputation was made. He also illustrated the best-known novels of Lever and Harrison Ainsworth in their original editions, and his work was in constant demand by publishers until a stroke of paralysis, in 1867, permanently injured his powers. His early ambition to become famous as a painter was not realized, but he gained great popularity and was awarded an annuity by the Royal Academy in 1878.

**BIBLIOGRAPHY.**—See John Forster, *Life of Charles Dickens* (1871-74); F. G. Kitton, "Phiz": *A Memoir* (1882); D. Croal Thomson, *Hablôt Knight Browne, Phiz: Life and Letters* (1884); M. H. Spielmann, *The History of Punch* (1895); *Charles Dickens and His Illustrators* (1899).

**BROWNE, ISAAC HAWKINS** (1705-1760), English poet, was born on Jan. 21, 1705, at Burton-on-Trent, of which place his father was vicar, and died in London on Feb. 14, 1760. He was educated at Lichfield, at Westminster school, and at Trinity college, Cambridge. He was called to the bar, but never practised. He was the author of "Design and Beauty," a poem addressed to his friend Joseph Highmore, the painter; and of "The Pipe of Tobacco" which parodied Cibber, Ambrose, Philips, Thomson, Young, Pope and Swift, who were then all living. In 1754 he published his chief work, *Dé Animi Immortalitate*, a Latin poem much admired by the scholars of his time. Johnson calls him "one of the first wits of this country."

Two editions of his *Poems on Various Subjects, Latin and English*, were published in 1767 by his son Isaac Hawkins Browne (1745-1818), the author of two vols. of essays on religion and morals. A full account by Andrew Kippis in *Biographia Britannica* (1780) includes large extracts from his poems.

**BROWNE, JAMES** (1793-1841), Scottish man of letters, was born at Whitefield, Perthshire, and educated at Edinburgh and at the University of St. Andrews. He wrote a "Sketch of the History of Edinburgh," for Ewbank's *Picturesque Views* of that city, 1823-25. His works include a *Critical Examination of Macculloch's Work on the Highlands and Islands of Scotland* (1826); *Aperçu sur les Hiéroglyphes d'Égypte* (1827); and *History of the Highlands and Highland Clans* (1834-36). In 1829 he became sub-editor of the seventh edition of the *Encyclopædia Britannica*, to which he contributed many articles.

**BROWNE, SIR JAMES** (1839-1896), Anglo-Indian engineer and administrator, was the son of Robert Browne of Falkirk in Scotland. He was educated at the military college, Addiscombe, and received a commission in the Bengal Engineers in 1857. He served in the expedition against the Mahsud Waziris (1860), in the Umbeyla campaign (1863), in the Afghan War (1878-79) as political officer and in the Egyptian campaign (1882). In 1884 he was appointed engineer in chief of the Sind-Pishin railway. In 1888 he was made a K.C.S.I. and in 1889 quartermaster-general for India. In 1892 he was appointed agent to the governor-general

in Baluchistan, in succession to Sir Robert Sandeman, his intimate experience of the Baluchis, gained during his railway work, having specially fitted him for this post. He died suddenly June 13, 1896.

See General McLeod Innes, *The Life and Times of Sir James Browne* (1905).

**BROWNE, MAXIMILIAN ULYSSES**, COUNT VON, BARON DE CAMUS AND MOUNTANY (1705-1757), Austrian field marshal, was born at Basle on Oct. 23, 1705. His father (Ulysses Freiherr v. Browne, d. 1731) was an Irish exile of 1690, who entered the imperial service and in 1716 was made a count of the Empire (*Reichsgraf*) by Charles VI. He was a lieutenant field marshal in command of the Silesian garrisons when in 1740 Frederick II. overran the province. His careful employment of such resources as he possessed materially hindered the king in his conquest and gave time for Austria to collect a field army (see AUSTRIAN SUCCESSION, WAR OF THE); he was wounded at the battle of Mollwitz. Browne took part in the Italian campaigns of 1746-49 and became commander-in-chief in Bohemia in 1751, and field marshal two years later. He was still in Bohemia when the Seven Years' War opened with Frederick's invasion of Saxony (1756). Browne's army, advancing to the relief of Pirna (see SEVEN YEARS' WAR), was met, and, after a hard struggle, defeated by the king at Lobositz (Oct. 1), but he drew off in excellent order, and soon made another attempt with a picked force to reach Pirna, by wild mountain tracks. He actually reached the Elbe at Schandau, but as the Saxons were unable to break out Browne retired, having succeeded, however, in delaying the development of Frederick's operations for a whole campaign. In the campaign of 1757 he voluntarily served under Prince Charles of Lorraine (q.v.) who was made commander-in-chief, and while leading a bayonet charge at the battle of Prague was wounded. He died on June 26, his last days embittered by the knowledge that he was unjustly held responsible for the failure of the campaign.

See *Zuverlässige Lebensbeschreibung U.M. Reichsgrafen, v. B. K. K. Gen.-Feldmarschall (Frankfurt and Leipzig, 1757)*; Baron O'Callaghan, *Gesch. der grössten Herrführer* (Rastadt, 1785, v. ii. pp. 264-316).

**BROWNE, PETER** (1665?-1735), Irish divine, was bishop of Cork and Ross from 1710 until his death in 1735. His two most important works are the *Procedure, Extent, and Limits of the Human Understanding* (1728), a critique of Locke's essay, and *Things Divine and Supernatural conceived by Analogy with Things Natural and Human*, more briefly referred to as the *Divine Analogy* (1733). The doctrine of analogy was intended as a reply to the deistical conclusions that had been drawn from Locke's theory of knowledge.

**BROWNE, ROBERT** (1550-1633), a leader among the early Separatist Puritans (hence sometimes called Brownists), was born at Toilethorpe, near Stamford, and educated at Corpus Christi college, Cambridge. He went to Norwich, where he gathered a numerous congregation, the members of which became associated in a religious "covenant," to the refusing of "all ungodlie communion with wicked persons." He seems also to have preached in various parts of Norfolk and Suffolk, especially at Bury St. Edmunds, and denounced the episcopal form of government. Dr. Freake, bishop of Norwich, caused him to be imprisoned early in 1581, but he was released through the influence of his remote kinsman, the Lord Treasurer Burghley. After two more periods in prison he migrated, in 1582, with his whole company to Middelburg in Zealand, but his community broke up within two years owing to internal dissensions.

Browne issued at Middelburg in 1582 two important works, *A Treatise of Reformation without Tarying for Anie*, in which he asserts the inalienable right of the Church to effect reforms without the authorization of the civil magistrate; and *A Booke which sheweth the life and manners of all True Christians*, in which he enunciates the theory of Congregational independency (see CONGREGATIONALISM). In Jan. 1584 (probably after writing *A True and Short Declaration*, the main source of our knowledge of his life hitherto) Browne and some of his company went to Edinburgh. He remained some months in Scotland and then returned to Stamford where he seems to have spent most of the next two

years, his residence being broken by visits to London and probably to the Continent (early in 1585), and by at least one imprisonment (summer, 1585). On Oct. 7, 1585, he was induced to make a qualified submission to the established order; and after further submission he was appointed, Nov. 1586, to the mastership of Stamford grammar school. His *A Reproofe of certaine schismatical persons and their doctrine touching the hearing and preaching of the word of God* (1587-88), which has recently been recovered, sheds a flood of light upon his later views.

In Sept. 1591 Browne accepted episcopal ordination and the rectory of Achurch-cum-Thorpe Waterville, in Northamptonshire. There he ministered for 42 years, with one lengthy interval, 1617-26, which is only partly accounted for. When over 80 years old he had a dispute with the parish constable about a rate, blows were struck, and before a magistrate he behaved so stubbornly that he was sent to Northampton gaol, where he died. Browne first formulated the ideal which subsequently became known as Congregationalism (*q.v.*). He held that every congregation, however small, constituted by common faith and the resolve to live according to God's word, was a complete church in itself; and that no secular government had any right to lay down rules for a State Church, or force conformity on them.

See H. M. Dexter, *The Congregationalism of the Last Three Hundred Years* (1880); C. Burrage, *The True Story of Robert Browne* (1906); *Congregational Historical Society's Transactions*, *passim* (1907-06).

**BROWNE, SIR THOMAS** (1605-82), English author and physician, was born in London. He was admitted as a scholar of Winchester college in 1616, and matriculated at Broadgates hall (Pembroke college), Oxford, in 1623, where he graduated B.A. in Jan. 1626. He took the further degree of M.A. in 1629, studied medicine, and practised for some time in Oxfordshire. Between 1630 and 1633 he left England, travelled in Ireland, France and Italy, and on his way home received the degree of M.D. at the University of Leyden. He returned to London in 1634, and, after a short residence at Shipden hall, near Halifax, settled in practice at Norwich in 1637. In 1642 a copy of *Religio Medici*, which he describes as "a private exercise directed to myself," was printed from one of his mss. without his knowledge, and reviewed by Sir Kenelm Digby in *Observations . . .* (1643). The interest aroused by this edition compelled Browne to put forth a correct version (1643) of the work, in which letters between Digby and Browne were included. The book was probably written as early as 1635, for he describes himself as still under 30. In 1646 he published *Pseudodoxia Epidemica; Enquiries into very many commonly received Tenents and commonly presumed Truths* (1646), and in 1658 *Hydriotaphia, Urne-Buriall; or, a discourse of the sepulchrell urnes lately found in Norfolk. Together with the Garden of Cyrus, or the quincunciall, lozenge, or net-work plantations of the ancients, artificially, naturally, and mystically considered. With Sundry observations* (1658). Several tracts, notably *Christian Morals* meant as a continuation of *Religio Medici*, were prepared for publication and appeared posthumously. In 1671 he received the honour of knighthood from Charles II. on his visit to Norwich. He began a correspondence with John Evelyn in 1658. Very few of the letters are extant, but the diarist has left an account of a visit to Browne (*Diary*, Oct. 17, 1671). He died in 1682 on his 77th birthday, and was buried at St. Peter's, Mancroft, Norwich.

The *Religio Medici* was a puzzle to his contemporaries, and it is still hard to reconcile its contradictions. A Latin translation appeared at Leyden in 1644, and it was widely read on the Continent, being translated subsequently into Dutch, French and German. In Rome the book was placed on the *Index Expurgatorius*. It is the confession of a mind keen and sceptical in some aspects, and credulous in others. Browne professes to be absolutely free from heretical opinions, but asserts the right to be guided by his own reason in cases where no precise guidance is given either by Scripture or by church teaching. The *Pseudodoxia Epidemica*, written in a direct and simple style, is a wonderful storehouse of out-of-the-way facts and scraps of erudition. That he himself was by no means free from superstition is proved by the fact

that the condemnation of two unfortunate women, Amy Duny and Rose Cullender, for witchcraft at Norwich in 1664 was aided by his professional evidence. The *Garden of Cyrus* is a continued illustration of one quaint conceit. The whole universe is ransacked for examples of the *Quincunx*, and he discovers, as Coleridge says, "Quincunxes in heaven above, quincunxes in earth below, quincunxes in the mind of man, quincunxes in tones, in optic nerves, in roots of trees, in leaves, in everything!" But the whole strength of his genius and the wonderful charm of his style are to be sought in the *Urne-buriall*, the concluding chapter of which, for richness of imagery and majestic pomp of diction, can hardly be paralleled in the English language.

**BIBLIOGRAPHY.**—In 1684 appeared a collection of *Certain Miscellany Tracts* (ed. Tenison), and in 1712 *Posthumous Works of the learned Sir Thomas Browne*. The first collected ed. of Browne's works appeared in 1686. Sir Thomas Browne's *Works, including his Life and Correspondence*, were carefully edited by Simon Wilkin in 1835-36. Among modern editions the most important are that for the English Library series, ed. by Charles Sayle (1904 *seq.*), and that by Geoffrey Keynes (6 vols. 1928 *seq.*). Browne's interest in bird-lore is noted by Evelyn, and some *Notes and Letters on the Natural History of Norfolk* were edited by T. Southwell (1902). G. L. Keynes prepared a *Bibliography of Sir Thomas Browne*, with portraits (1924); see also E. Gosse, *Life of Sir Thomas Browne* (1905), and R. Sencourt, *Out-flying Philosophy . . . a literary study of the religious element in the works of Sir Thomas Browne* (1925).

**BROWNE, WILLIAM** (1591-1643), English pastoral poet, was born at Tavistock, Devonshire. He is said to have proceeded to Oxford c. 1603. He entered the Inner Temple in 1611. His elegy on the death of Henry, prince of Wales, and the first book of *Britannia's Pastorals* appeared in 1613; the *Shepherd's Pipe*, which contained some eclogues by other poets, in 1614; and the second book of the pastorals in 1616. The times were unfavourable to his tranquil talent, and he retired to private life.

Browne's *Arcadia* is localized in his native Devonshire. He was untiring in his praises of "Tavy's voiceful stream (to whom I owe more strains than from my pipe can ever flow)." He knew local history and traditions, and he celebrates the gallant sailors who "by their power made the Devonian shore Mock the proud Tagus" (*Brit. Past.* bk. ii., song 3). It is for his truthful, affectionate pictures of his country life and its surroundings that the stories of Marina and Celandine, Doridon and the rest are still read. A copy of Browne's pastorals with annotations in Milton's handwriting is preserved in the Huth library, and there are many points of likeness between Lycidas and the elegy on Philarete (Thomas Manwood) in the fourth eclogue of the *Shepherd's Pipe*. Keats also was a student of Browne.

The first two books of *Britannia's Pastorals* were re-issued in 1625. The third, though it had no doubt circulated in the author's lifetime, was edited from a ms. for the Percy Society by T. C. Croker in 1852. A collected edition of Browne's works was published in 1772 by John Davies. Some sonnets to Caelia, epistles, elegies and epitaphs, with miscellaneous poems, were printed for the first time by Sir S. E. Brydges in 1815; excellent modern complete editions of Browne include W. C. Hazlitt's (1868-69) for the Roxburghe library, and a more compact one (1894) by Mr. Gordon Goodwin, with an introduction by Mr. A. H. Bullen, for the "Muses' Library." For an elaborate analysis of Browne's obligations to earlier pastoral writers see F. W. Moorman, "William Browne," *Quellen und Forschungen zur Sprach- und Kulturgeschichte der Germanischen Völker* (Strassburg, 1897).

**BROWNE, WILLIAM GEORGE** (1768-1813), English traveller, was born at Great Tower Hill, London, on July 25 1768, and was educated at Oriel college, Oxford. He went out to Egypt in 1792. In May 1793 he set out for Darfur by the annual caravan. He was forcibly detained by the sultan of Darfur and was unable to effect his purpose of returning by Abyssinia. He was allowed to return to Egypt with the caravan in 1796. In 1799 he published his *Travels in Africa, Egypt and Syria, from the year 1792 to 1798*. In 1800 Browne again left England, and spent three years in visiting Greece, some part of Asia Minor and Sicily. In 1812 he once more set out for the East, proposing to penetrate to Samarkand. He spent the winter in Smyrna, and in the spring of 1813 travelled through Asia Minor and Armenia, made a short

stay at Erzerum, and arrived on June 1 at Tabriz. About the end of the summer of 1813 he left Tabriz for Teheran, intending to proceed to Tartary, but was shortly afterwards murdered.

Robert Walpole published, in the second volume of his *Memoirs relating to European and Asiatic Turkey* (1820), from papers left by Browne, the account of his journey in 1802 through Asia Minor to Antioch and Cyprus; also, *Remarks written at Constantinople* (1802).

**BROWNELL, WILLIAM CRARY** (1851-1928), American critic, was born in New York on Aug. 30, 1851. He was educated at Amherst college. From 1879 to 1881 he served on the staff of *The Nation*, and after 1890 was literary adviser for Charles Scribner's Sons, New York publishers. His first two books, *French Traits* (1889) and *French Art* (1892), established a new and difficult standard for the American critic, but a standard which Brownell maintained for himself in all his succeeding books: *Newport* (1896), *Victorian Prose Masters* (1901), *American Prose Masters* (1909), *Criticism* (1914), *Standards* (1917), *The Genius of Style* (1924) and *Democratic Distinction in America* (1927). He died at Williamstown, Mass., on July 22, 1928.

**BIBLIOGRAPHY.**—See Stuart P. Sherman's introduction to the "Modern Students' Library" edition of *American Prose Masters*; George A. McLean, *John Morley and Other Essays* (1920); Russell Sturgis, "William Crary Brownell as Critic on Fine Art," *International Monthly*, vol. v. p. 445-467.

**BROWNHILLS**, urban district, Staffordshire, England, 6m. west of Lichfield, on the L.M.S. railway and near the Essington canal. Population (1931) 18,368. There are extensive coal-mines in the district, forming part of the Cannock Chase deposit. The town lies on the Roman Watling street, and remains of earthworks are seen at Knave's Castle, on the Street, and at Castle Old Fort, 2m. south-east. Ogley Hay, the parish of which partly covers Brownhills, is a large adjoining village.

**BROWNIAN MOVEMENT.** A liquid at rest, such as water in a glass, appears homogeneous, continuous and motionless throughout. If we put into the water a denser substance, such as a glass marble, it sinks, and we know that once it reaches the bottom it will not rise again of its own accord. If with the water we mix certain powder consisting of extremely minute particles, we shall see by observation of the powder that the motion of these different lots of water, which at first resolves itself into parallel currents, becomes less and less defined. Eventually the particles are diffused in all directions throughout the water until the whole appears to be quite motionless.

These familiar motions, which are based on the powers of the naked eye, are shown by microscopic investigation to be absolutely false. Many particles which are put in water (or into any fluid) instead of sinking steadily, are at once endowed with a very vigorous motion, which is quite haphazard and irregular. The particle continuously moves to and fro; it rotates and rises and sinks, showing no tendency to come to rest, and maintaining indefinitely the same average state of agitation. This wonderful phenomenon, which was anticipated by Lucretius and all but discovered by Buffon, was definitely established by Brown in 1827, and is generally described as *Brownian movement*.

The phenomenon is not peculiar to water, but is met with in all fluids, and is present in inverse proportion to the viscosity of the fluids. Thus it is scarcely perceptible in glycerine but is extremely active in gases. It can also be observed in the case of water globules supported by the "black spots" of soap bubbles, the size of the globules, as compared with the thickness of the film, being much the same as that of an orange compared with a sheet of paper; the Brownian movement, which is negligible in a direction at right angles to the film, is very lively in the plane of the film, being almost what it would be in a gas. In a given fluid the movement of the particles is more intense as the size of the particle diminishes. This property was pointed out by Brown when he first made his discovery. The nature of the particles is immaterial. In the same fluid two particles exhibit practically the same activity when they are of the same size, no matter of what substance they are composed, and no matter what is their density. The higher the temperature, the more rapid is the movement.

The motion cannot be due to vibration of the slide supporting the droplet under observation, because if such vibration be caused

purposely there arise currents in the bulk of the liquid which are at once recognized to be merely superimposed on the irregular movements of the particles. Moreover, Brownian motion occurs in fluids supported by a rigid vessel at night in the country, just as unmistakably as it does in the daytime in a town, when the containing vessel rests on a table which is continually being shaken by the passing of heavy traffic. Similarly, the movement cannot be ascribed to general convection effects produced by variations of temperature. Such convection currents are easily recognizable and are totally unrelated to the characteristic irregular movement. Finally—and this is perhaps its strangest and most startling characteristic—Brownian movement *never ceases*, according to many authorities. It can be described within a cell which has been closed so as to prevent evaporation, for days and even years. It can be seen in liquid occlusions in quartz, which have been sealed up for thousands of years. It is inherent and eternal.

All these features compel us to agree with Wiener (1863) that "*the movement does not originate in the particles themselves, nor in any cause exterior to the liquid, but must be attributed to internal movements characteristic of the fluid state*"; the smaller the particles are, the more readily do they respond to this motion. In this way we arrive at an essential property of what is commonly termed a fluid in equilibrium: the apparent quiescence of a fluid is an illusion due to the imperfection of our senses, and really represents a permanent *condition of violent irregular motion*. This is an experimental fact quite apart from any question as to theory.

#### MOLECULAR HYPOTHESIS

**Motions of Liquid Particles.**—A little consideration of Brownian movement leads us to still more profound and far-reaching conclusions. The really novel property of the movement is that it never ceases. This seems contrary to our everyday experience of friction effects. For instance, if we fling a bucket of soapy water into a washtub, we are justified in supposing that before long the movements of the liquid will disappear. But let us consider how this apparent equilibrium has been reached. All the water particles had at first velocities nearly equal and parallel. This uniformity is destroyed as soon as some of the particles, striking the sides of the washtub, rebound in different directions with changed velocity, and thus impair the uniformity of movement of the rest of the water. The result is that immediately after it falls in the tub, all parts of the water are in motion; but in assuming the velocity of the various particles to be equal and parallel, we must consider a very small volume of the liquid. The motion can easily be made evident by putting into the liquid coloured particles, which acquire increasingly irregular movements in relation to one another. What we observe, consequently, as far as we can observe anything, is not that the movements stop but that the energy of the initial mass movement is dissipated more and more irregularly among smaller and smaller portions of liquid.

On the other hand, more exact experiments which demonstrate the heating of bodies by friction enable us to state that when the soapy water has come to "rest," its temperature will be slightly higher than when it was moving as a whole before being stopped by the tub. Brownian movement in this quantity of liquid will therefore have become more vigorous, seeing that its activity increases with the temperature. If we could follow under the microscope the dissipation of the original mass movement among progressively smaller masses, we should see that an appreciable part of that original movement was conserved by the particles of soapy water. Now the latter are themselves merely "indicating" powders, and they show us that in the liquid itself, beside the mass movement which at each moment is being frittered away in all directions among smaller and smaller particles, there is a movement which at each moment automatically redistributes itself in such a way as to impart velocity to any particle which has come to rest. The permanent state which marks the final temperature becomes established when, at each moment, exactly as much motion is thus being re-distributed as is being dissipated.

**Velocity Distribution.**—Since the dissemination of the original movement in a liquid is not indefinite, but inherently limited,

it follows that the liquids are composed of particles which can take up all possible motions with regard to one another, but within the interiors of which no dissipation of energy can occur. If such particles did not exist it would be difficult to understand how dissipation, once commenced, could stop. These particles are in unceasing movement, and by colliding with one another mutually alter their velocities in magnitude and direction, so that *their velocities vary with complete irregularity around a certain average, just as a marksman's bullets are scattered about the target.* (Maxwell's distribution law.)

Granting this complete irregularity, it follows, in particular, that in a cell which is large in comparison with the diameter of the particles the number of particles possessing a certain velocity, at any given moment, differs by an infinitesimal amount from the number of particles having the same speed but in the contrary direction. The velocity of the centre of gravity of all these particles is, at each instant, therefore, not absolutely zero, but becomes more and more negligible as the size of the cell increases. If the size of the cell diminishes, the mean velocity of the centre of gravity will increase and may be detected under the microscope. If an indicating powder be present in the cell it will acquire this velocity, which is nevertheless very small as compared with the mean velocity of the particles: this is the explanation of Brownian movement.

These particles have only to be called *molecules* to recall an ancient hypothesis already envisaged by Epicurus and Lucretius—the hypothesis of the discontinuous structure of matter. In this one instance, however, the hypothesis is the outcome of logical induction, prompted by observation of phenomena. Brownian movement as an experimental reality leads us to postulate molecules in perpetual motion, and it can then be readily understood that any particle immersed in a fluid is jostled incessantly by neighbouring molecules and from them receives impulses which, when added together, are the less likely to produce equilibrium the smaller the particle, so that the particle takes on a violently irregular course.

**Study of Emulsions.**—If the molecular agitation is indeed the cause of Brownian movement, and the latter forms a link between our ordinary scale of dimensions and that of molecules, then we should be able to arrive at the latter. This, however, depends on the link being properly understood. The study of the Brownian movement of particles in suspension in suitably selected liquids and the comprehension that the laws of dilute solutions applied to such emulsions have led to simple determinations—one of them very direct—of molecular magnitudes.

An *emulsion* is made by suspending in a fluid a great number of particles all of the same nature. This emulsion is stable if the particles in suspension do not cohere when the chances of Brownian movement bring them together and if they re-enter the liquid when these chances bring them against the containing vessel or to the surface. A stable emulsion of this kind is comparable to a solution in both of these respects. In addition, if the particles in suspension are of equal size (which can be effected by fractional centrifugation of emulsions of certain resins, as we shall see later), the laws applicable to solutions apply equally in the case of such emulsions.

#### EXTENSION OF THE GAS LAWS TO EMULSIONS

It should be borne in mind in the first place how, thanks to Van't Hoff, the Gas laws, and especially Avogadro's law, became recognized as applicable to dilute solutions. The pressure exerted by a gas on its containing walls becomes, in the case of a dissolved substance, the *osmotic pressure* exerted on *semi-permeable* walls which allow the solvent to pass, but stop the solute. A membrane of copper ferrocyanide separating aqueous sugar solution from pure water is an example.

Pfeffer's measurements show that equilibrium exists only when a definite excess pressure is established on the side where the sugar is, and Van't Hoff has pointed out that the amount of this excess pressure (osmotic pressure) is precisely the same as the pressure which would be exerted, in accordance with Avogadro's law, on the walls of the vessel containing the sugar solution, if the

sugar contained therein could alone occupy the vessel in the gaseous state. Hence it is probable that the same thing will apply to any dissolved substance; and there is no need even to cite the thermodynamical arguments by which Van't Hoff supported this generalization, nor to make any other measurements of osmotic pressure, for Arrhenius showed that any substance which, in solution, obeys the well-known laws of Raoult as regards its freezing point and vapour pressure, will, as a necessary consequence, exert the pressure predicted by Van't Hoff on any boundary-wall which stops it without stopping its solvent. In short, Raoult's laws, which are founded on a very large number of measurements, are logically equivalent to Van't Hoff's laws; the latter embodies the extension of Avogadro's law to solutions, and we can now say: *equal numbers of molecules, of any kind whatever, either in the gaseous state or dissolved, exert (at the same temperature and in equal volumes) equal pressures on the walls which confine them.*

This law applies to heavy and to light molecules indiscriminately; thus the quinine molecule, which contains over 100 atoms, produces neither more nor less effect when it impinges against the walls than the light hydrogen molecule which contains only two atoms. Perrin suggests that this law may also apply to even the visible particles in stable emulsions, with the result that each of the particles agitated by Brownian movement may count as a molecule when it happens to strike a confining wall.

Let us then assume that we can measure the osmotic pressure exerted as a result of their Brownian movement by particles of equal size on any surface element which stops them but allows water to pass, *e.g.*, blotting paper. Suppose, also, that we can count the number of particles per unit volume in the immediate vicinity of the surface element, so as to know their concentration. This number,  $n$ , also designates the concentration of molecules in any gas (let us say hydrogen) which would exert the same pressure on the walls of the vessel in which it was contained. If, for instance, the osmotic pressure thus measured is the 100-millionth of a dyne per square centimetre, we know that, under normal conditions (when the pressure is one million dynes per square centimetre), one cubic centimetre of hydrogen will contain 100 million million times  $n$  molecules ( $10^{14}n$ ). Also, one gram-molecule (22.412 cu.cm. in the gaseous state at N.T.P.) will contain 22.412 times this number of molecules; the product will be *Avogadro's Number*. This is quite simple; but how are we to measure the extremely minute osmotic pressure exerted by an emulsion?

As a matter of fact, this will not be necessary, any more (as we have just explained) than it is to measure the osmotic pressure of a solution in order to make sure that the solution obeys the gas laws. It will be quite sufficient to demonstrate, in the case of emulsions, some property which can be treated experimentally, and which is the logical outcome of these laws. Jean Perrin found such a property (1908) when he extended to certain emulsions the well-known law that in a vertical column of gas in equilibrium the density decreases as altitude increases.

#### LAW OF THE VERTICAL DISTRIBUTION OF A GAS

We all know that the air is rarer at the top of a mountain than at sea-level, and in general the atmospheric pressure must diminish as one mounts, because it is caused by a shorter and less dense column of the atmosphere than at sea-level. Each horizontal stratum of a gas in equilibrium is treated as if it were in a large vertical cylinder and imprisoned between two rigid pistons, which prevent any exchange of molecules between this stratum and neighbouring strata of the gas, and thus conserve equilibrium. The pistons are supposed to exert respectively the pressures prevailing at the lower and upper surface of the stratum; thus, per unit surface area, the difference between these pressures is equal to the weight of gas supported. If the thickness  $dh$  of the stratum be so small that there is only an infinitesimal difference between the molecular concentration  $n$  near the upper face and the concentration near the lower face, then  $dp$ , the difference between the pressure at these faces will be equal to  $n \bar{\omega} dh$ , where  $\bar{\omega}$  represents the mass of a molecule, therefore  $dp = n \bar{\omega} dh$ .

This very simple equation expresses two important facts: first, since the concentration  $n$  of molecules is proportional to the pres-

sure  $p$  at a given temperature, we see that in a column of some given gas (*i.e.*,  $\bar{\omega}$  is given) at uniform temperature, the relative decrease of pressure  $dp/p$ , or alternatively, the relative lowering of concentration  $dn/n$  which may be said to measure the degree of rarefaction, has always the same value for the same difference  $dh$  in level, whatever the level may be. For example, when climbing a staircase, the air pressure (or molecular concentration) falls by  $\frac{1}{10000}$  of its value, for each step. Summing these effects step by step, we can see that from whatever level we start, in air at uniform temperature, whenever we ascend by the same degree, the pressure (or the density) always becomes divided by the same number; thus in oxygen at  $0^\circ \text{C}$ , the rarefaction will be doubled for each vertical rise of five kilometres.

The second point immediately resulting from our equation concerns the mass  $\bar{\omega}$  of the molecule; for a given level  $dh$ , the rarefaction  $dp/p$  (or  $dn/n$ ) varies inversely as the molecular weight. Here again, integrating the effect, we see that, in two different gases at the same temperature, elevations which cause the same degree of rarefaction are inversely proportional to the molecular weights. Thus the oxygen molecule weighs 16 times as much as the hydrogen molecule; in order to double the degree of rarefaction, therefore, it is necessary to rise 16 times as high in hydrogen as in oxygen, *viz.*, 80 kilometres. We may assume that Avogadro's law holds good for short columns of emulsions, as it does for gases, if the particles are comparatively large.

#### AN EMULSION DISTRIBUTES ITSELF LIKE A GAS

Suppose a stable emulsion with comparatively large particles of uniform size has been made and left to stand at constant temperature solely under the influence of gravity. For a small depth we may apply the preceding argument without any appreciable change, other than that resulting from the fact that the particles are now separated, not by a vacuum, but by a liquid which exerts a thrust on each particle in the opposite direction to its weight, in accordance with Archimedes' principle. Hence, the effective weight of the particle, to which the argument applies, is its real weight less this thrust. If, then, our generalization is permissible, once the emulsion is in equilibrium it will act as a *miniature atmosphere with visible molecules*, in which equal increases of altitude will be accompanied by equal rarefaction. If, for instance, it is necessary to ascend 1,000 million times further in oxygen than in the emulsion in order to double rarefaction, it is because the effective mass of a particle in the emulsion is 1,000 million times the mass of the molecule of oxygen. It will, therefore, suffice to determine the effective mass of the visible particles (which form our link between ordinary and molecular dimensions) in order to find, by simple proportion, the mass of any molecule and hence Avogadro's number.

**Perrin's Experiments.**—Experiments have been carried out on these lines. First, stable emulsions were prepared, containing solid (transparent) spheres of various resins, suspended in a liquid (usually water). By a process of fractional centrifugation, the granules were successfully sorted out into definitely known sizes, so that suspensions of uniform granules resulted. It was also possible to determine the density of the substance of which these visible particles were composed. Everything necessary for calculating the effective mass of a particle in the emulsion was then available. The distribution of the emulsion under the influence of gravity was studied by means of instantaneous photography, a drop of liquid being confined in a carefully sealed cell suitable for microscopic observation. A limiting distribution with reversible variation of concentration according to the rise or fall of temperature became established.

It is easy to confirm that the distribution of the particles attains a permanent condition. All that is required is to note the value of the ratio,  $n_0/n$ , of the concentrations at two levels, from hour to hour. This ratio, at first almost unity, increases and tends to reach a limit. In a height of one-tenth millimetre, with water as the continuous medium, the distribution limit was practically attained in one hour. The values of the ratio  $n_0/n$  actually observed after three hours, and again at the end of a fortnight, were exactly the same. The distribution limit is a distribution in reversible

equilibrium, for if it be exceeded the system automatically reverts to it. One method of exceeding this limit, that is, to cause too many particles to accumulate in the lower layers, is to cool the emulsion—this causes a higher concentration in these layers—and then to raise the temperature to its original figure, when the original disposition will be regained. The most careful measurements gave  $68 \times 10^{22}$  as the value of Avogadro's number  $N$ . (See ELEC-TRON, THE, for Millikan's value for  $N$ .)

#### THE LAWS OF BROWNIAN MOVEMENT

**Displacement in a Given Time.**—It is owing to Brownian movement that an equilibrium distribution is established in an emulsion, the more vigorous the movement the more rapid being the establishment of equilibrium. Variations in Brownian activity, however, do not affect the final distribution, which is always the same for particles of the same size and apparent density. Therefore the ultimate conditions can be studied without consideration of the mechanism by which they have been established. Detailed analysis of this mechanism was made by Einstein in his brilliant theoretical studies. Besides this, the tentative, but very suggestive, analysis of this same problem due to Smoluchowski certainly deserves mention, although published subsequently, because of the different method of attack. Einstein and Smoluchowski both defined the activity of Brownian movement in the same manner. Previous to this, a "mean speed of agitation" had to be determined by following the path of a particle as closely as possible. The values thus found were always a few microns per second for particles of the order of a micron in diameter (one micron is  $\frac{1}{1,000}$  of a millimetre). Such values are seriously in error. The irregularities of the path are so numerous and so rapid that it is impossible to follow them, and the recorded path is far simpler and shorter than the true path. Further, the apparent mean speed of a particle during a given period varies enormously in magnitude and direction, with no tendency towards a limit as the time of observation diminishes; this may readily be seen by noting the successive positions of a particle in the camera lucida, first every minute, then, say, every five seconds, and better still, by photographing them every  $\frac{1}{10}$  of a second.

Dismissing, therefore, the true velocity as immeasurable, and neglecting the extremely tangled path described by a particle in a given time, Einstein and Smoluchowski chose to define the magnitude of the movements in terms of a rectilinear segment connecting the starting and finishing points, which, on the average, will evidently be greater the more vigorous is the motion. This segment will represent the *displacement* of the particle during the time taken. The projection to a horizontal plane, observed directly in the microscope under ordinary experimental conditions, with the microscope vertical, will be the *horizontal displacement*.

**Activity of Brownian Movement.**—In accordance with the ideas suggested by qualitative observation, it will be granted that Brownian movement is quite irregular at right angles to the vertical. This is more than a mere hypothesis, and all the consequences following from it can be verified. Having granted this, it can be proved, without any other hypothesis, that the mean displacement of a particle is only doubled when the time of displacement is quadrupled, and increased only tenfold when the time is increased a hundredfold, and so on. More precisely, it is demonstrable that the mean square  $\bar{x}^2$  of the horizontal displacement during time  $t$  increases in direct proportion to that time.

The same applies, consequently, to one-half of this square, *i.e.*, to the mean square  $\bar{x}^2$  of the projection of the horizontal displacement on an arbitrary horizontal axis. Expressed in another way,  $\bar{x}^2/t$  is constant for a given particle immersed in a given liquid. This ratio, which is obviously greater the more violently the particle moves, defines the *activity of the Brownian movement* of the particle.

**Diffusion of Emulsions.**—It is to be expected that if pure water were in contact with an aqueous emulsion of uniform particles, Brownian movement would cause *diffusion* of the particles in the water by a process analogous to that causing the true diffusion of dissolved substances. Further, such diffusion would be more rapid the more active the Brownian movement of the

particles. Einstein's calculations, made entirely on the assumption that Brownian motion is completely irregular, show that an emulsion actually does diffuse like a solution, the coefficient of a diffusion  $D$  being just equal to half the number which expresses the activity of Brownian movement:—

$$D = \frac{1}{2} \cdot \frac{x^2}{t}$$

In a vertical column of emulsion, the final permanent condition is created and maintained by the interplay of two opposing processes, gravity which is constantly attracting the particles downwards, and Brownian movement which is continually dispersing them. This idea can be more precisely stated in the following form: for each stratum, the loss through diffusion towards regions of low concentration balances the gain through gravitation towards regions of high concentration.

In the special case when the particles are spheres of radius  $a$  (to which an attempt can be made to apply Stokes' law which has been actually verified for spherules of microscopic dimensions), and assuming also that at equal concentrations particles and molecules produce the same osmotic pressure, it is found that:

$$D = \frac{RT}{N} \cdot \frac{1}{6\pi a\eta}$$

where  $\eta$  is the viscosity of the liquid,  $T$  its absolute temperature, and  $N$  is Avogadro's number. Seeing that the coefficient of diffusion is one-half of the activity of Brownian movement, this equation can be put in the form:

$$\frac{x^2}{t} = \frac{RT}{N} \cdot \frac{1}{3\pi a\eta}$$

Thus, the activity of Brownian movement (and the rapidity of diffusion) must be proportional to the absolute temperature, and inversely proportional to the viscosity of the liquid and to the radius of the particles.

Einstein immediately perceived that the order of magnitude of movement seemed to fit in with these conclusions. Smoluchowski reached the same result in a learned discussion of the data then available, which consisted of the nature and the density of the particles being immaterial; the qualitative observations of the increase of movement with rise of temperature and with diminution of particle size; and a rough evaluation of the displacements of particles of the order of a micron in size. Thence it became possible to state definitely that Brownian movement is certainly not more than five times as active as the predicted motion, nor less than one-fifth of it. This approximate agreement in the order of magnitude and in the qualitative properties of the phenomenon at once lent considerable force to the kinetic theory, and this was clearly indicated by the originators of that theory.

No support to these observations of Einstein and Smoluchowski was published until 1908, when an interesting, but only partial, verification appeared, by Seddig, who compared, at various temperatures, the displacements experienced by ultramicroscopic particles of cinnabar estimated to be nearly uniform in size. If Einstein's formula is correct, the mean displacements  $d$  and  $d$  at 17° C and 90° C must be in the ratio 2.05, allowing for the change in viscosity. Experiment gave 2.2. The discrepancy was much smaller than the possible experimental error.

**Rotational Brownian Movement.**—So far we have considered only the changes of position of particles, that is, their Brownian movement of *translation*, but the complete phenomenon includes irregular rotation of the particles. At the same time that they undergo displacement, Einstein succeeded in formulating, in the case of this Brownian movement of *rotation*, an equation comparable with the preceding, for spheres of radius  $a$ . If  $A^2$  represents the mean square for a time  $t$  of the component of the angle of rotation around an axis, the ratio  $\frac{A^2}{t}$ , which is fixed for any particular particle, will represent the *activity* of the rotational Brownian movement and must satisfy the equation:—

$$\frac{A^2}{t} = \frac{RT}{N} \cdot \frac{1}{4\pi a^3\eta}$$

Thus, as in the case of motion of translation, the activity of the rotational movement is proportional to the absolute temperature, and inversely proportional to the viscosity; but it varies inversely as the volume of the particle, and not inversely as its linear dimension. A spherule of diameter 10 will possess translational motion one-tenth of that of a spherule of unit diameter, whereas its rotational motion will be the  $\frac{1}{1,000}$  part of that of the latter. While the method by which this equation was obtained cannot be indicated here, we may point out that, for a given particle, it implies *equality between the mean energy of translation and the mean energy of rotation*, as foreseen by Boltzmann.

#### PERRIN'S EXPERIMENTAL VERIFICATION OF BROWNIAN MOVEMENT LAWS

All these theories lend themselves to verification, as soon as spherules of measurable diameter can be prepared. The law of displacement is verified as follows: The successive horizontal displacements of a given particle are measured by observation in the camera lucida (with known magnification) of the successive positions of the particle at equal time intervals.

Three patterns have been reproduced on the adjoining diagram, on a magnified scale of 16 divisions to 50 microns; they were obtained by tracing the horizontal projections of the consecutive positions at half-minute intervals of a single particle of mastic, of radius 0.53 micron. It will be noticed that this diagram readily gives the projection on any horizontal axis (these will be abscissae, or ordinates, given by the use of squared paper). Incidentally, a diagram like this, giving a large number of displacements on an arbitrary scale, furnishes only an extremely inadequate idea of the extraordinary complexity of the actual path. If plottings were made at time-intervals 100 times shorter, each segment would be replaced by a zig-zag outline relatively as complicated as the whole diagram.

Perrin's measurements have shown that the expression

$$\frac{t}{x^2} \cdot \frac{RT}{3\pi a\eta}$$

which must be equal to Avogadro's number  $N$  in accordance with Einstein's equation, has a value  $64 \times 10^{22}$ , which is independent of the nature of the emulsion. This approaches the value already found for  $N$ . Many different measurements were made, varying the experimental conditions within wide limits, especially the viscosity and the size of the particles. Finally, even the formula for rotational Brownian movement was verified, giving  $N$  equal to  $65 \times 10^{22}$ . (See ELECTRON, THE, for Millikan's value.)

Summarizing, Brownian movement is an experimental fact, which reveals evidence of the existence of molecules which are themselves inaccessible under the microscope. From the philosophic standpoint, emphasis must again be laid on the fact that Brownian movement proves to us that rest and equilibrium can only be an outward semblance which masks a state of disorder and unrest; it prepares us for a profound alteration in the aspect of the universe as soon as we alter the scale of our observations.

**BROWNING, ELIZABETH BARRETT** (1806–1861), English poet, wife of the poet Robert Browning, was born on Feb. 10, 1806, the daughter and eldest child of Edward Barrett Moulton, who added the surname of Barrett on the death of his maternal grandfather, whose large estates in Jamaica he inherited. His wife was Mary Graham Clarke, daughter of J. Graham Clarke of Fenton Hall, Newcastle-on-Tyne. Elizabeth's childhood was passed in the country, chiefly at Hope End, a house bought

by her father in the beautiful country in sight of the Malvern Hills. Her country poems, such as "The Lost Bower," "Hector in the Garden" and "The Deserted Garden," refer to the woods and gardens of Hope End. Elizabeth Barrett was much the companion of her father, who pleased himself with printing fifty copies of what she calls her "great epic of eleven or twelve years old, in four books"—*The Battle of Marathon* (sent to the printer in 1819). The love of Pope's Homer, she adds, led her to the study of Greek, and of Latin as a help to Greek. In 1832, Mr. Barrett sold his house of Hope End and brought his family to Sidmouth, Devon, for some three years. There Elizabeth made a translation of the *Prometheus Bound* of Aeschylus, published with some original poems (1833). After that time London became the home of the Barretts until the children married and the father died. The temporary dwelling was at 74, Gloucester Place, Portman Square, and in 1838 the lease was taken of 50, Wimpole Street.

In the middle of the year 1836 Elizabeth Barrett made the acquaintance of R. H. Horne, afterwards famous for a time as the author of *Orion*, but perhaps best remembered as her correspondent (*Letters to R. H. Horne*, 2 vols., 1877). This acquaintance led to the appearance of poems by Miss Barrett in the *New Monthly Magazine*, edited by Bulwer (Lord Lytton), and in other magazines or annuals. But the publication of *The Seraphim and other Poems* (1838) was a graver step. Miss Barrett's volume was well reviewed, but not popular, and no second edition was required; of the poems afterwards famous it contained three, "Cowper's Grave," "My Doves," and "The Sea-Mew." In 1837 Elizabeth had made the memorable acquaintance of Wordsworth. With Landor, at the same date, a meeting took place that had long results. At this time, too, began another of Elizabeth's valued friendships—that with Miss Mitford, author of *Our Village*. Mr. John Kenyon also became at about this time a dear and intimate friend. He was a distant cousin of the Barretts, had published some verse, and was a warm and generous friend to men of letters. From the date of the birth of their child (1849) he gave the Brownings a hundred pounds a year, and when he died in 1856 he bequeathed to them £11,000. To him a great number of Elizabeth's letters are addressed, and to him in later years was *Aurora Leigh* dedicated. Elizabeth Barrett began also in London an acquaintance with Harriet Martineau. In early girlhood Elizabeth had a spinal affection and her lungs became delicate. She broke a blood-vessel in the beginning of the Barretts' life in town and was thereafter an invalid, and generally a recluse, until her marriage. In 1838 it was found necessary to remove her to Torquay, where she spent three years, accompanied by her brother Edward, the dearest of her eight brothers, and for a time by her father and sisters. During this time of physical suffering she underwent the greatest grief of her life by the drowning of her beloved brother in Babbacombe bay. The accident of Edward Barrett's meeting with his death through her residence at Torquay, and the minor accident of her having parted from him on the day of his death, as she said, "with pettish words," increased her anguish of heart to horror. With an impulse of self-protection she went to work as soon as her strength sufficed. One of her tasks was a part taken in the *Chaucer Modernized* (1841), a work suggested by Wordsworth, to which he, Leigh Hunt, Horne and others contributed. In 1841 she returned to Wimpole Street, and in that and the following year she was at work on two series of articles on the Greek Christian poets and on the English poets, written for the *Athenaeum*.

In 1842 we notice the name of Robert Browning in her letters: "Mr. Horne the poet and Mr. Browning the poet were not behind in approbation," she says in regard to her work on the poets. "Mr. Browning is said to be learned in Greek, especially the dramatists." In this year also she declares her love for Tennyson. To Kenyon she writes, "I ought to be thanking you for your great kindness about this divine Tennyson." In 1842, moreover, she had the pleasure of a letter from Wordsworth, who had twice asked Kenyon for permission to visit her. The visit was not permitted on account of Miss Barrett's ill-health. Now Haydon sent her his unfinished painting of the great poet musing upon Helvellyn;

she wrote her sonnet on the portrait, and Haydon sent it to Rydal Mount. Wordsworth's commendation is rather cool. In August 1843 "The Cry of the Children" appeared in *Blackwood's Magazine*, and during the year she was associated with her friend Horne in a critical work, *The New Spirit of the Age*, rather by advice than by direct contribution. Her two volumes of poems (1844) appeared, six years after her former book, under the title of *Poems, by Elizabeth Barrett Barrett*. In the beginning of the following year came the letter from a stranger that was to be so momentous to both. "I had a letter from Browning the poet last night," she writes to her old friend Mrs. Martin, "which threw me into ecstasies—Browning, the author of *Paracelsus*, the king of the mystics." America was at least as quick as England to appreciate her poetry; among other messages thence came in the spring letters from Lowell and from Mrs. Sigourney. In the same year the letters first speak of the hope of a journey to Italy. The winters in London were lowering Elizabeth's strength of resistance against disease. She longed for the change of light, scene, manners and language, and the longing became a hope, until her father's prohibition doomed her, as she and others thought, to death, without any perceptible reason for the denial of so reasonable a desire.

Meanwhile the friendship with Browning had become the chief thing in Elizabeth Barrett's life. The correspondence, once begun, had not flagged. In the early summer they met. He became her frequent visitor and kept her room fragrant with flowers. He never lagged, whether in friendship or in love. We have the strange privilege, since the publication of the letters between the two, of following the whole course of this noble love-story from beginning to end, and day by day. Browning was six years younger than the woman he so passionately admired, and he at first believed her to be confined by some hopeless physical injury to her sofa. But of his own wish and resolution he never doubted. Her hesitation, in regard for his liberty and strength, to burden him with an ailing wife, she has recorded in the sonnets afterwards published under a slight disguise as *Sonnets from the Portuguese*. She refused him once "with all her will, but much against her heart," and yielded at last for his sake rather than her own. Her father's will was that his children should not marry, and the prohibition struck terror into the hearts of the three dutiful and sensitive girls. Robert Browning's addresses were, therefore, kept secret. Browning was reluctant to practise the deception; Elizabeth alone knew how impossible it was to avoid it. When she was persuaded to marry, it was she who insisted, in mental and physical terror, upon a secret wedding. Throughout the summer of 1846 her health improved, and on Sept. 12 the two poets were married in St. Marylebone Parish church. Elizabeth's two sisters had been permitted to know of the engagement but not of the wedding, so that their father's anger might not fall on them too heavily. For a week Mrs. Browning remained in her father's house. On Sept. 19 she left it, taking her maid and her little dog, joined her husband and crossed to the Continent.

For climate and cheapness they settled in Italy, choosing Florence in the spring of 1847, and remaining there, with the interruptions of a change to places in Italy such as Siena and Rome, and to Paris and England, until Mrs. Browning's death. It was at Pisa that Robert Browning first saw the *Sonnets from the Portuguese*, poems which his wife had written in secret and had no thought of publishing. He, however, resolved to give them to the world. "I dared not," he said, "reserve to myself the finest sonnets written in any language since Shakespeare's." The judgment, which the existence of Wordsworth's sonnets renders obviously absurd, may be pardoned. The sonnets were sent to Miss Mitford and published at Reading as *Sonnets by E. B. B.*, in 1847. In 1850 they were included, under their final title, in a new issue of poems. During the Pisan autumn appeared in *Blackwood's Magazine* seven poems by Mrs. Browning which she had sent some time before; at Pisa also she wrote and sent to America a poem, "The Runaway Slave at Pilgrim Point," which was published in Boston, in *The Liberty Bell*, in 1848, and separately in England in 1849. In the summer of 1847 the Brownings left their temporary dwelling in Florence and took the apartment in Casa Guidi, near the Pitti Palace, which was thenceforth their chief

home. Early in their residence began that excited interest in Italian affairs which made so great a part of Mrs. Browning's emotional life. Mrs. Browning, by degrees, wrote *Casa Guidi Windows* on behalf of the Florentines and as an appeal to the always impulsive sympathies of England. In 1849 was born the Brownings' only child, Robert Wiedemann Barrett. After this event, Mrs. Browning prepared a new issue, with some additions of her poems (1850). *Casa Guidi Windows* followed in 1851. Visiting England in that year, the Brownings saw much of the Proctors, and something of Florence Nightingale, Kingsley, Ruskin, Rogers, Patmore and Tennyson, and also of Carlyle, with whom they went to Paris where they saw George Sand, and where they passed the December days of their *coup d'état*. Mrs. Browning happened to take a political fancy to Napoleon III. whom she would probably have denounced if a tithe of his tyrannies had occurred in Italy, and the fancy became more emotional in after years.

A new edition of Mrs. Browning's poems was called for in 1853, and at about this time, in Florence, she began to work on *Aurora Leigh*. She was still writing this poem when the Brownings were again in England in 1855. After another interval in Paris they were in London again—Mrs. Browning for the last time. She was with her cousin Kenyon during the last months of his life. In October 1856 the Brownings returned to their Florentine home, Mrs. Browning leaving her completed *Aurora Leigh* for publication. The book had an immediate success; a second edition was required in a fortnight, a third a few months later. In the fourth edition (1859) several corrections were made.

In 1857 Mrs. Browning addressed a petition in the form of a letter, to the emperor Napoleon begging him to remit the sentence of exile upon Victor Hugo. In 1857 Mrs. Browning's father died, unreconciled. Henrietta Barrett had married, like her sister, and like her was unforgiven. In 1858 occurred another visit to Paris and another to Rome, where Hawthorne and his family were among the Brownings' friends. In 1859 came the Italian war in which Mrs. Browning's hasty sympathies were hotly engaged. Her admiration of Napoleon III. knew no bounds, and was not even destroyed by the peace of Villafranca. That peace, however, was a bitter disappointment, and her fragile health suffered. At Siena and Florence this year the Brownings were very kind to Landor, old, solitary and ill. Mrs. Browning's poem, "A Tale of Villafranca," was published in the *Athenaeum* in September and afterwards included in *Poems before Congress* (1860). Then followed another long visit to Rome, and there Mrs. Browning prepared for the press this, her last volume. The little book was judged with some impatience, *A Curse for a Nation*, being mistaken for a denunciation of England, whereas it was aimed at America and her slavery.

On June 30, 1861, Elizabeth Barrett Browning died. Her married life had been supremely happy. Something has been said of the difference between husband and wife in regard to "spiritualism," in which Mrs. Browning had interest and faith, but no division ever interrupted their entirely perfect affection and happiness. Browning buried his wife in Florence, under a tomb designed by their friend Frederick Leighton. On the wall of Casa Guidi is placed the inscription "Qui scrisse e morì Elisabetta Barrett Browning, che in cuore di donna conciliava scienza di dotto e spirito di poeta, e fece del suo verso aureo anello fra Italia e Inghilterra. Pone questa lapide Firenze grata 1861." In 1866 Robert Browning published a volume of selections from his wife's works.

The place of Elizabeth Barrett Browning in English literature is high, if not upon the summits. She had an original genius, a fervent heart, and an intellect that was, if not great, exceedingly active. She seldom has composure or repose, but it is not true that her poetry is purely emotional. It is full of abundant, and even over-abundant thoughts. It is intellectually restless. The impassioned peace of the greatest poetry, such as Wordsworth's, is not hers. Nor did she apparently seek to attain those heights. Her Greek training taught her little of the economy that such a poetic education is held to impose; she "dashed" not by reason of feminine weakness, but as it were to prove her possession of

masculine strength. Her gentler work, as in the *Sonnets from the Portuguese*, is beyond praise. There is in her poetic personality a glory of righteousness, of spirituality, and of ardour that makes her name a splendid one in the history of an incomparable literature.

**BROWNING, JOHN M.** (1854-1926), American inventor, was born at Ogden, Utah, of Mormon parentage. In 1879 he secured a patent for a breech-loading, single-shot rifle, which he sold to the Remington Company. He designed many types of sporting fire-arms such as the Remington autoloading shot-guns and rifles; the Winchester repeating shot-guns, single-shot and repeating rifles; the Stevens rifles; and the Colt automatic pistols. In 1890 a machine-gun of his design, but known as the Colt, and in 1908 his automatic pistols were adopted by the U.S. Army. He later developed two types of machine-guns, which were adopted by the United States in 1918 for use in the World War. He died in Belgium on Nov. 26, 1926.

**BROWNING, OSCAR** (1837-1923), English writer, was born in London Jan. 17 1837, and died in Rome Oct. 6 1923. He was educated at Eton and at King's college, Cambridge, of which he became fellow and tutor. He was for 15 years a master at Eton, resuming residence in 1876 at Cambridge, where he became university lecturer in history. He soon became a prominent figure in college and university life, encouraging especially the study of political science and modern political history, the extension of university teaching and the movement for the training of teachers.

He is well known to Dante students by his *Dante; Life and Works* (1891); and to the study of Italian history he has contributed *Guelphs and Ghibellines* (1903). His works on modern history include *England and Napoleon in 1803* (1887), *History of England* (1890), *Wars of the Nineteenth Century* (1899), *History of Europe 1814-1843* (1901), *Napoleon, the first Phase* (1905). In 1910 he published *Memories of Sixty Years at Eton, Cambridge and Elsewhere*, and *Memories of Later Years* in 1923.

**BROWNING, ROBERT** (1812-1889), English poet, was born at Camberwell, London, on May 7, 1812. He was the son of Robert Browning (1781-1866), who for 50 years was employed in the Bank of England. Earlier Brownings had been settled in Wiltshire and Dorsetshire, and there is no ground for the statement that the family was partly of Jewish origin. The poet's mother was a daughter of William Wiedemann, a German who had settled in Dundee and married a Scottish wife. His parents had one other child, a daughter, Sarianna, born in 1814. They lived quietly in Camberwell. The elder Browning had a sufficient income and was indifferent to money-making. He had strong literary and artistic tastes. He was an ardent book collector, and so good a draughtsman that paternal authority alone had prevented him from adopting an artistic career. He had, like his son, a singular faculty for versifying, and helped the boy's early lessons by twisting the Latin grammar into grotesque rhymes. He lived, as his father had done, to be 84, with unbroken health. The younger Robert inherited, along with other characteristics, much of his father's vigour of constitution. From the mother, who had delicate health, he probably derived his excessive nervous irritability; and from her, too, came his passion for music. The family was united by the strongest mutual affection, and the parents erred, if anything, on the side of indulgence. Browning was sent to a school in the neighbourhood, but left it when 14, and had little other teaching. He had a French tutor for the next two years, and in his 18th year he attended some Greek lectures at London university. At school he never won a prize, though it was more difficult to avoid than to win prizes. He was more conspicuous

for the love of birds and beasts, which he always retained, than for any interest in his lessons. He rather despised his companions and made few friends. A precocious poetical capacity, however, showed itself in extra-scholastic ways. He made his schoolfellows act plays, partly written by himself. He had composed verses before he could write, and when 12 years old completed a volume of poems called *Incondita*. His parents tried unsuccessfully to find a publisher; but his verses were admired by Sarah Flower, afterwards Mrs. Adams, a well-known hymn-writer of the day, and by W. J. Fox, both of whom became valuable friends. A copy made by Miss Flower was in existence in 1871, but afterwards destroyed by the author. Browning had the run of his father's library, and acquired a very unusual amount of miscellaneous reading. Quarles's *Emblems* was an especial favourite; and besides the Elizabethan dramatists and standard English books, he had read all the works of Voltaire. Byron was his first master in poetry, but about the age of 14 he fell in accidentally with Shelley and Keats. For Shelley in particular he conceived an enthusiastic admiration which lasted for many years, though it was qualified in his later life.

The more aggressive side of Browning's character was as yet the most prominent; and a self-willed lad, conscious of a growing ability, found himself cramped in Camberwell circles. He rejected the ordinary careers. He declined the offer of a clerkship in the Bank of England; and his father, who had found the occupation uncongenial, not only approved the refusal but cordially accepted the son's decision to take poetry for his profession. For good or evil, Browning had been left very much to his own guidance, and if his intellectual training suffered in some directions, the liberty permitted the development of his marked originality. The parental yoke, however, was too light to provoke rebellion. Browning's mental growth led to no violent breach with the creeds of his childhood. His parents became Dissenters in middle life but often attended Anglican services; and Browning, though he abandoned the dogmas, continued to sympathize with the spirit of their creed. He never took a keen interest in the politics of the day but cordially accepted the general position of contemporary Liberalism. His worship of Shelley did not mean an acceptance of his master's hostile attitude towards Christianity, still less did he revolt against the moral discipline under which he had been educated. He frequented literary and artistic circles, and was passionately fond of the theatre; but he was entirely free from a coarse Bohemianism, and never went to bed, we are told, without kissing his mother. He lived with his parents until his marriage. His mother lived till 1849, and his father till 1866, and his affectionate relations to both remained unaltered. Browning's first published poem, *Pauline*, appeared anonymously in 1833. He always regarded it as crude and destroyed all the copies of this edition that came within his reach. It was only to avoid unauthorized reprints that he consented with reluctance to republishing it in the collected works of 1868. Its indication of genius was recognized by W. J. Fox, who hailed it in the *Monthly Repository* as marking the advent of a true poet. *Pauline* contains an enthusiastic invocation of Shelley, whose influence upon its style and conception is strongly marked. It is the only one of Browning's works which can be regarded as imitative. In the winter of 1833, he went to St. Petersburg on a visit to the Russian consul-general, Mr. Benckhausen. There he wrote the earliest of his dramatic lyrics, "Porphyria's Lover" and "Johannes Agricola." In the spring of 1834 he visited Italy for the first time, going to Venice and Asolo. Browning's personality was fully revealed in his next considerable poems, *Paracelsus* (1835) and *Sordello* (1840). With *Pauline*, however, they form a group. In an essay (prefixed to the spurious Shelley letters of 1851), Browning describes Shelley's poetry "as a sublime fragmentary essay towards a presentment of the correspondence of the universe to the Deity." The phrase describes his own view of the true functions of a poet, and Browning, having accepted the vocation, was meditating the qualifications which should fit him for his task. The hero of *Pauline* is in a morbid state of mind which endangers his fidelity to his duty. *Paracelsus* and *Sordello* are studies in the psychology of genius, illustrating its besetting temptations. *Paracelsus* fails from intellectual pride,

not balanced by love of his kind, and from excessive ambition, which leads him to seek success by unworthy means. *Sordello* is a poet distracted between the demands of a dreamy imagination and the desire to utter the thoughts of mankind. He finally gives up poetry for practical politics and gets into perplexities only to be solved by his death. *Pauline* might in some indefinite degree reflect Browning's own feelings, but in the later poems he adopts his characteristic method of speaking in a quasi-dramatic mood. They are, as he gave notice, "poems, not dramas." The interest is not in the external events but in the "development of a soul"; but they are observations of other men's souls, not direct revelations of his own. *Paracelsus* was based upon a study of the original narrative, and *Sordello* was a historical though a very indefinite person. The background of history is intentionally vague in both cases. There is one remarkable difference between them. The *Paracelsus*, though full of noble passages, is certainly diffuse. Browning heard that John Sterling had complained of its "verbosity," and tried to remedy this failing by the surgical expedient of cutting out the usual connecting words. Relative pronouns henceforth become scarce in his poetry, and the grammatical construction often a matter of conjecture. Words are forcibly jammed together instead of being articulately combined. To the ordinary reader many passages in his later work are both crabbed and obscure, but the "obscurity" never afterwards reached the pitch of *Sordello* which is due to the vagueness with which the story is rather hinted than told, as well as to the subtlety and intricacy of the psychological expositions. The subtlety and vigour of the thought are indeed surprising and may justify the frequent comparisons to Shakespeare; and it abounds in descriptive passages of genuine poetry.

Still, Browning seems to have been misled by a fallacy. It was quite legitimate to subordinate the external incidents to the psychological development in which he was really interested, but to secure the subordination by making the incidents barely intelligible was not a logical consequence. We should not understand Hamlet's psychological peculiarities the better if we had to infer his family troubles from indirect hints. Browning gave more time to *Sordello* than to any other work, and perhaps had become so familiar with the story which he professed to tell that he failed to make allowance for his readers' difficulties. In any case it was not surprising that the ordinary reader should be puzzled and repelled, and the general recognition of his genius long delayed, by his reputation for obscurity. It might, however, be expected that he would make a more successful appeal to the public by purely dramatic work, in which he would have to limit his psychological speculation and to place his characters in plain situations. *Paracelsus* and *Sordello* show so great a power of reading character and appreciating subtler springs of conduct that its author clearly had one, at least, of the essential qualifications of a dramatist.

Before *Sordello* appeared Browning had tried his hand in this direction. He was encouraged by outward circumstances as well as by his natural bent. He was making friends and gaining some real appreciative admirers. John Forster had been greatly impressed by *Paracelsus*. Browning's love of the theatre had led to an introduction to Macready in the winter of 1835-36; and Macready, who had been also impressed by *Paracelsus*, asked him for a play. Browning consented and wrote *Strafford*, which was produced at Covent Garden in May 1837, Macready taking the principal part. Later dramas were *King Victor* and *King Charles*, published in 1842; *The Return of the Druses* and *A Blot on the 'Scutcheon* (both in 1843), *Colombe's Birthday* (1844), *Luria* and *A Soul's Tragedy* (both in 1846), and the fragmentary *In a Balcony* (1853). *Strafford* succeeded fairly, though the defection of Vandenhoff, who took the part of Pym, stopped its run after the fifth performance. The *Blot on the 'Scutcheon*, produced by Macready as manager of Drury Lane on Feb. 11, 1843, led to an unfortunate quarrel. Browning thought that Macready had felt unworthy jealousy of another actor, and had gratified his spite by an inadequate presentation of the play. He remonstrated indignantly and the friendship was broken off for years. Browning was disgusted by his experience of the annoyances of practical play-writing, though he was not altogether discouraged. The play

had apparently such a moderate success as was possible under the conditions, and a similar modest result was attained by *Colombe's Birthday*, produced at Covent Garden on April 25, 1853. Browning, like other eminent writers of the day, failed to achieve the feat of attracting the British public by dramas of high literary aims, and soon gave up the attempt. It has been said by competent critics that some of the plays could be fitted for the stage by judicious adaptation. The *Blot on the 'Scutcheon* has a very clear and forcibly treated situation; and all the plays abound in passages of high poetic power. Like the poems, they deal with situations involving a moral probation of the characters, and often suggesting the ethical problems which always interested him. The speeches tend to become elaborate analyses of motive by the persons concerned, and try the patience of an average audience. For whatever reason, Browning, though he had given sufficient proofs of genius, had not found in these works the most appropriate mode of utterance.

The dramas, after *Strafford*, formed the greatest part of a series of pamphlets called *Bells and Pomegranates*, eight of which were issued from 1841 to 1846. The name, he explained, was intended to indicate an "alternation of poetry and thought." The first number contained the fanciful and characteristic *Pippa Passes*. The seventh, significantly named *Dramatic Romances and Lyrics*, contained some of his most striking shorter poems. In 1844 he contributed six poems, among which were "The Flight of the Duchess" and "The Bishop orders his Tomb at St. Praxed's Church," to Hood's *Magazine*, in order to help Hood, then in his last illness. These poems take the special form in which Browning is unrivalled. He wrote very few lyrical poems of the ordinary kind purporting to give a direct expression of his own personal emotions. But, in the lyric which gives the essential sentiment of some impressive dramatic situation, he has rarely been approached. There is scarcely one of the poems published at this time which can be read without fixing itself at once in the memory as a forcible and pungent presentation of a characteristic mood. Their vigour and originality failed to overcome at once the presumption against the author of *Sordello*. Yet Browning was already known to and appreciated by such literary celebrities of the day as Talfourd, Leigh Hunt, Procter, Monckton Milnes, Carlyle, and Landor. His fame began to spread among sympathetic readers. The *Bells and Pomegranates* attracted the rising school of "pre-Raphaelites," especially D. G. Rossetti, who guessed the authorship of the anonymous *Pauline* and made a transcript from the copy in the British Museum. But his audience was still select.

Another recognition of his genius was of incomparably more personal importance and vitally affected his history. In 1844 Miss Barrett (*see* BROWNING, ELIZABETH BARRETT) published a volume of poems containing "Lady Geraldine's Courtship," with a striking phrase about Browning's poems. He was naturally gratified, and her special friend and cousin, John Kenyon, encouraged him to write to her. She admitted him to a personal interview after a little diffidence, and a hearty appreciation of literary genius on both sides was speedily ripened into genuine and most devoted love. Miss Barrett was six years older than Browning and a confirmed invalid with shaken nerves. She was tenderly attached to an autocratic father who objected on principle to the marriage of his children. The correspondence of the lovers (published in 1899) shows not only their mutual devotion, but the chivalrous delicacy with which Browning behaved in a most trying situation. Miss Barrett was gradually encouraged to disobey the utterly unreasonable despotism. They made a clandestine marriage on Sept. 12, 1846. The state of Miss Barrett's health suggested misgivings which made Browning's parents as well as his bride's disapprove of the match. She, however, appears to have become stronger for some time, though always fragile and incapable of much active exertion. She had already been recommended to pass a winter in Italy. Browning had made three previous tours there, and his impressions had been turned to account in *Sordello* and *Pippa Passes*, in *The Englishman in Italy* and *Home Thoughts from Abroad*. For the next 15 years the Brownings lived mainly in Italy, making their headquarters at

Florence in the Casa Guidi. A couple of winters were passed in Rome. In the summer of 1849 they were at Siena, where Browning was helpful to Landor, then in his last domestic troubles. They also visited England and twice spent some months in Paris. Their only child, Robert Wiedemann Browning, was born at Florence in 1849. Browning's literary activity during his marriage seems to have been comparatively small; *Christmas Eve and Easter Day* appeared in 1850, while the two volumes called *Men and Women* (1855), containing some of his best work, showed that his power was still growing. His position involved some sacrifice and imposed limitations upon his energies. Mrs. Browning's health required a secluded life; and Browning, it is said, never dined out during his marriage, though he enjoyed society and made many and very warm friendships. Among their Florence friends were Margaret Fuller Ossoli, Isa Blagden, Charles Lever, and others. The only breach of complete sympathy with his wife was due to his contempt for "spiritualists" and "mediums," in whom she fully believed. His portrait of Daniel Dunglas Home as "Sludge the Medium" only appeared after her death. This domestic happiness, however, remained essentially unbroken until she died on June 29, 1861. The whole love-story had revealed the singular nobility of his character, and, though crushed for a time by the blow, he bore it manfully. Browning determined to return to England and superintend his boy's education at home. He took a house at 19, Warwick crescent, Paddington, and became gradually acclimatized in London. He resumed his work and published the *Dramatis Personae* in 1864. The publication was well enough received to mark the growing recognition of his genius, which was confirmed by *The Ring and the Book*, published in four volumes in the winter of 1868-69. In 1867 the university of Oxford gave him the degree of M.A. "by diploma," and Balliol college elected him as an honorary fellow. In 1868 he declined a virtual offer of the rectorship of St. Andrews. He repeated the refusal on a later occasion (1884) from a dislike to the delivery of a public address. The rising generation was now beginning to buy his books; and he shared the homage of thoughtful readers with Tennyson, though in general popularity he could not approach his friendly rival, *The Ring and the Book* has been generally accepted as Browning's masterpiece. It was based on a copy of the *procès verbal* of Guido Franceschini's case discovered by him at Florence.

The audacity of the scheme is surprising. To tell the story of a hideous murder 12 times over, to verify the arguments of counsel and the gossip of quidnuncs, and to insist upon every detail with the minuteness of a law report, could have occurred to no one else. The poem is so far at the opposite pole from *Sordello*. Vagueness of environment is replaced by a photographic distinctness, though the psychological interest is dominant in both. Particular phrases may be crabbed, but nothing can be more distinct and vivid in thought and conception. If some of those "dramatic monologues" of which the book is formed fail to be poetry at all, some of them—that of Pompilia the victim, her champion Caponsacchi, and the pope who gives judgment—are in Browning's highest mood, and are as impressive from the ethical as from the poetical point of view. Pompilia was no doubt in some respects an idealized portrait of Mrs. Browning. Other pieces may be accepted as a background of commonplace to throw the heroic into the stronger relief, *The Ring and the Book* is as powerful as its method is unique.

Browning became gentler and more urbane as he grew older. His growing fame made him welcome in all cultivated circles, and he accepted the homage of his admirers with dignity and simplicity. He exerted himself to be agreeable in private society, though his nervousness made him invariably decline ever to make public speeches. He was an admirable talker, and took pains to talk his best. A strong memory supplied him with abundant anecdotes; and though occasionally pugnacious, he allowed a fair share of the conversation to his companions. Superficial observers sometimes fancied that the poet was too much sunk in the man of the world; but the appearance was due to his characteristic reluctance to lay bare his deeper feelings. When due occasion offered, the underlying tenderness of his affections was abundantly

manifest. No one could show more delicate sympathy. He made many warm personal friendships in his later years, especially with women, to whom he could most easily confide his feelings. In the early years of this period he paid visits to country houses, but afterwards preferred to retire farther from the London atmosphere into secluded regions. He passed some holidays in remote French villages, Pornic, Le Croisic, and St. Aubyn, which have left traces in his poetry. *Gold Hair* is a legend of Pornic, and *Hervé Riel* was written at Le Croisic. At St. Aubyn he had the society of Joseph Milsand, who had shown his warm appreciation of Browning's poetry by an article in the *Revue des Deux Mondes*, which in 1852 had led to a personal friendship lasting till Milsand's death in 1886. Browning sent to him the proof-sheets of all his later works for revision. In 1877 Browning was at La Saisiaz on the Salève, near Geneva, where an old friend, Miss Egerton Smith, was staying. She died suddenly almost in his presence. She had constantly accompanied him to concerts during his London life. After her death he almost ceased to care for music. The shock of her loss produced the singular poem called *La Saisiaz*, in which he argues the problem of personal immortality with a rather indefinite conclusion. In later years Browning returned to Italy and passed several autumns at Venice. He never visited Florence after his wife's death there.

Browning's literary activity continued till almost the end of his life. He wrote constantly, though he composed more slowly. He considered 25 or 30 lines to be a good day's work. His later writings covered a very great variety of subjects, and were cast in many different forms. They show the old characteristics and often the old genius. Browning's marked peculiarity, the union of great speculative acuteness with intense poetical insight, involved difficulties which he did not always surmount. He does not seem to know whether he is writing poetry or when he is versifying logic; and when the speculative impulse gets the upper hand, his work suggests the doubt whether an imaginary dialogue in prose would not have been a more effective medium. He is analysing at length when he ought to be presenting a concrete type, while the necessities of verse complicate and obscure the reasoning. A curious example is the *Prince Hohenstiel-Schwangau* (1871), an *alias* for Louis Napoleon. The attempt to show how a questionable hero apologizes to himself recalls the very powerful "Bishop Blougram," and "Sludge the Medium," of earlier works, but becomes prolix and obscure. *Fifine at the Fair* (1872) is another curious speculation containing a defence of versatility in love-making by an imaginary Don Juan. Its occasionally cynical tone rather scandalized admirers, who scarcely made due allowance for its dramatic character. Browning's profound appreciation of high moral qualities is, however, always one main source of his power. In later years he became especially interested in stories of real life, which show character passing through some sharp ordeal. The *Red Cotton Nightcap Country* (1873), describing a strange tragedy which had recently taken place in France, and especially *The Inn Album* (1875), founded on an event in modern English society, are powerful applications of the methods already exemplified in *The Ring and the Book*. The *Dramatic Idyls* (1879 and 1880) are a collection of direct narratives, with less analytical disquisition, which surprised his readers by their sustained vigour. In the last volumes, *Jocoseria* (1883), *Ferishtah's Fancies* (1884), *Parleyings with Certain People* (1887) and *Asolando* (1889), the old power is still apparent but the hand is beginning to fail. They contain discussions of metaphysical problems, such as the origin of evil, which are interesting as indications of his creed, but can scarcely be regarded as successful either poetically or philosophically.

Another group of poems showed Browning's interest in Greek literature. *Balaustion's Adventure* (1871) includes a "transcript from Euripides," a translation, that is, of part of the *Alcestis*. *Aristophanes' Apology* (1875) included another translation from the *Heracles*, and in 1877 he published a very literal translation of the *Agamemnon*. This, it seems, was meant to disprove the doctrine that Aeschylus was a model of literary style. Browning shared his wife's admiration for Euripides, and takes a phrase from one of her poems as a motto for *Balaustion's Adventure*. In

the *Aristophanes' Apology* this leads characteristically to a long exposition by Aristophanes of his unsatisfactory reasons for ridiculing Euripides. It recalls the apologies of "Blougram" and Louis Napoleon, and contains some interesting indications of his poetical theory. Browning was to many readers as much prophet as poet. His religious position is most explicitly, though still not very clearly, set forth in the *Christmas Eve and Easter day* (1850). Like many eminent contemporaries, he combined a disbelief in orthodox dogma with a profound conviction of the importance to the religious instincts of the symbols incorporated in accepted creeds. *Saul* (1845), *A Death in the Desert* (1864), and similar poems, show his strong sympathy with the spirit of the old belief, though his argumentative works have a more or less sceptical turn. It was scarcely possible, if desirable, to be original on such topics. His admirers hold that he shows an affinity to German metaphysicians, though he had never read their works or made any express study of metaphysical questions. His distinctive tendency is to be found rather in the doctrine of life and conduct which both suggest and is illustrated by his psychological analyses. A very characteristic thought emphatically set forth in the *Rabbi Ben Ezra* (1864) and the *Grammarians' Funeral* (1855) is that a man's value is to be measured, not by the work done, but by the character which has been moulded. He delights in exhibiting the high moral instinct which dares to override ordinary convictions, or which is content with discharge of obscure duties, or superior to vulgar ambition and capable of self-sacrifice, because founded upon pure love and sympathy for human suffering. Browning's limitations are characteristic of the poetry of strong ethical pre-occupations. His strong idiosyncrasy, his sympathy with the heroic and hatred of the base, was hardly to be combined with the Shakespearean capacity for sympathizing with the most varied types of character. Though he deals with a great variety of motive with singularly keen analysis, he takes almost exclusively the moral point of view. That point of view, however, has its importance, and his morality is often embodied in poetry of surpassing force. Browning's love of the grotesque, sometimes even of the horrible, creates many most graphic and indelible portraits. The absence of an exquisite sense for the right word is compensated by the singular power of striking the most brilliant flashes out of obviously wrong words, and forcing comic rhymes to express the deepest and most serious thoughts. Though he professed to care little for motive as apart from human interest, his incidental touches of description are unsurpassably vivid.

The appreciation of Browning's genius became general in his later years, and zeal was perhaps a little heightened by the complacency of disciples able to penetrate a supposed mist of obscurity. The Browning Society, founded in 1881 by Dr. F. J. Furnivall and Miss E. H. Hickey, was a product of this appreciation, and helped to extend the study of the poems. Browning accepted the homage in a simple and friendly way, though he avoided any action which would make him responsible for the publications. He received various honours: LL.D. degree from Cambridge in 1879, the D.C.L. from Oxford in 1882, and LL.D. from Edinburgh in 1884. He became foreign correspondent to the Royal Academy in 1886. His son, who had settled at Venice, married in 1887, and Browning moved to De Vere Gardens. In the autumn of 1889 he went with his sister to visit his son, and stayed on the way at Asolo, which he had first seen in 1838, when it supplied the scenery of *Pippa Passes*. He was charmed with the place, and proposed to buy a piece of ground and to build upon it a house to be called "Pippa's Tower"—in memory of his early heroine. While his proposal was under consideration he went to his son at Venice. His health had been breaking for some time, and a cold, aggravated by weakness of the heart, brought on a fatal attack. He died on Dec. 12, 1889. He was buried in Westminster Abbey on Dec. 31. It was suggested that his wife's body should be removed from Florence to be placed beside him; but their son rightly decided that her grave should not be disturbed.

Browning's personal characteristics are so strongly stamped upon all his works that it is difficult to assign his place in contemporary thought. He is unique and outside of all schools. His style is so peculiar that he is the easiest of all poets to parody

and the most dangerous to imitate. In spite of his early Shelley worship he is in certain respects more closely related to Wordsworth. Both of them started by accepting the poet's mission as quasi-prophetic or ethical. In other respects they are diametrically contrasted. Wordsworth expounded his philosophy by writing a poetical autobiography. Browning adheres to the dramatic method of which Wordsworth was utterly incapable. He often protested against the supposition that he put himself into his books. Yet there is no writer whose books seem to readers to be clearer revelations of himself. Nothing, in fact, is more characteristic of a man than his judgments of other men, and Browning's are keen and unequivocal. The revolutionary impulse had died out, and Browning has little to say either of the political questions which had moved Shelley and Byron, or of the social problems which have lately become more prominent. He represents the thought of a quieter epoch. He was little interested, too, in the historical or "romantic" aspect of life. He takes his subjects from a great variety of scenes and places—from ancient Greece, mediaeval Italy and modern France and England; but the interest for him is not in the picturesque surroundings, but in the human being who is to be found in all periods. Like Balzac, whom he always greatly admired, he is interested in the eternal tragedy and comedy of life. His problem is always to show what are the really noble elements which are eternally valuable in spite of failure to achieve tangible results. He gives, so far, another version of Wordsworth's doctrine of the cultivation of the "moral being." The psychological acuteness and the subtle analysis of character are, indeed, peculiar to himself. Like Carlyle, with whom he had certain points of affinity, he protests, though rather by implication than direct denunciation, against the utilitarian or materialistic view of life, and finds the divine element in the instincts which guide and animate every noble character. When he is really inspired by sympathy for such emotions he can make his most grotesque fancies and his most far-fetched analyses subservient to poetry of the highest order. It can hardly be denied that his intellectual ingenuity often tempts him to deviate from his true function, and that his observations are not to be excused because they result from an excess, instead of a deficiency, of intellectual acuteness. But the variety of his interests—æsthetic, philosophical, and ethical—is astonishing, and his successes are poems which stand out as unique and unsurpassable in the literature of his time. (L. S.)

*The Life and Letters of Browning*, by Mrs. Sutherland Orr (1891), one of his most intimate friends in later years, and *The Love Letters of Robert Browning and Elisabeth Barrett Browning*, 1845-46, published by his son in 1899, are the main authorities. The fullest *Life* is by W. Hall Griffin, completed by H. C. Minchin (1910). A collection of Browning's poems in 2 vols. appeared in 1849, another in 3 vols. in 1863, another in 6 vols. in 1868, and a revised edition in 16 vols. in 1888-89; in 1896 Augustine Birrell and F. G. Kenyon edited a complete edition in 2 vols.; another two-volume edition was issued in 1900. A centenary edition in 10 vols. was published in 1912 with introductions by F. G. Kenyon. Among commentaries on Browning's works, Mrs. Sutherland Orr's *Handbook to the Works of Browning* was approved by the poet himself. See also the Browning Society's *Papers*; T. J. Wise, *Materials for a Bibliography of the Writings of Robert Browning*, included in the *Literary Anecdotes of the Nineteenth Century* (1895), by W. Robertson Nicoll and T. J. Wise; Edmund Gosse, *Robert Browning: Personalia* (1890), from notes supplied by Browning himself. Among biographical and critical authorities may be mentioned: J. T. Nettlehip, *Essays* (1868); Arthur Symonds, *An Introduction to the Study of Browning* (1886); Stopford Brooke, *The Poetry of Robert Browning* (1902). G. K. Chesterton, *Browning* (1908) in the "English Men of Letters" series; and E. Berger, "Robert Browning" in the *Grands Écrivains étrangers* series (1912); Frances M. Sim, *Robert Browning* (1923).

**BROWNLEE, JOHN** (1868-1927), Scottish medical statistician. After holding various medical appointments, in 1914 he became statistician to the medical research committee. His best known works include the memoir on the epidemiology of phthisis, and his investigations of the laws governing the rise and decline of epidemic diseases, especially measles and influenza. He died on March 20, 1927.

**BROWN-SÉQUARD, CHARLES EDWARD** (1817-1894), British physiologist and neurologist, was born at Port Louis, Mauritius, on April 8, 1817 of mixed American-French

parentage. After graduating in medicine at Paris in 1846 he held chairs at Harvard university and at Paris. Eventually he succeeded Claude Bernard in 1878 as professor of experimental medicine in the Collège de France. He died on April 2, 1894 at Sceaux. Brown-Séquard was the first scientist to work out the physiology of the spinal cord, demonstrating that the decussation of the sensory fibres is in the cord itself. He also did valuable work on the internal secretion of organs, the results of which have been applied with the most satisfactory results in the treatment of myxoedema. Unfortunately, in his extreme old age, he advocated the hypodermic injection of a fluid prepared from the testicles of sheep as a means of prolonging human life. It was known among scientists, derisively, as the Brown-Séquard elixir. His researches, published in about 500 essays and papers, especially in the *Archives de Physiologie*, which he helped to found in 1868, cover a very wide range of physiological and pathological subjects.

**BROWNSON, ORESTES AUGUSTUS** (1803-1876), American writer, was born in Stockbridge (Vermont), Sept. 16, 1803. His changes in religion from Presbyterianism to Universalism, from Unitarianism to the Society for Christian Union and Progress, which he organized, and from that to Roman Catholicism; his philosophy, a modified intuitionism in which he followed Comte and Victor Cousin, who in his *Fragments philosophiques*, praised him; his schemes for social reform, including establishment of the Workingman's party; his outpourings of opinion in his *Boston Quarterly Review* (1838-42) and *Brownson's Quarterly Review* (1844-64, 1873-75); and his rather mystical poetry all make him part of that strange combination of foreign philosophy, religious ecstasy, social uplift, and literary enthusiasm termed the transcendental movement. His chief books were *The American Republic: Its Constitution, Tendencies and Destiny* (1865), in which he based government on ethics, and those of an autobiographical nature including *Charles Elwood, or the Infidel Converted* (1840). He died in Detroit (Mich.) April 17, 1876.

After Brownson's death, his son, Henry F. Brownson, collected and published his *Works* (Detroit, 1882-87), of which a condensed summary appeared, also prepared by his son, entitled *Literary, Scientific, and Political Views of Orestes A. Brownson*. The son also published a biography (Detroit, 1898-1900). A doctor's dissertation by V. G. Michel, *The Critical Principles of Orestes A. Brownson* (Washington, D.C., 1918) contains a bibliography. Extracts from his writings appeared in 1910 and 1923.

**BROWNSVILLE**, a city in the southern tip of Texas, U.S.A., 250m. S.E. of San Antonio, on the Rio Grande, about 22m. from its mouth, opposite Matamoros, Mexico; a port of entry and the county seat of Cameron county. It is connected by the Rio Grande railway with Point Isabel on the Gulf of Mexico, where a deep-water harbour was under construction (1928) by the Federal Government; and is served by the Missouri Pacific and the Southern Pacific railways. Population in 1920 was 11,791, of whom 3,782 were foreign-born whites; and was 22,021 in 1930 by the Federal census. It has a considerable trade with northern Mexico, and is the financial and commercial centre of the rich lower Rio Grande valley, of which about a third (500,000 acres) is under irrigation, and where the growing season lasts 365 days, and two or three crops a year on the same land are the rule. Grapefruit, early vegetables, cotton and corn are the leading products.

There is a large natural palm grove six miles from the city. An ocean drive of 140m. runs from Boca Chica, near the mouth of the river, to Corpus Christi bay. A great variety of fish and game abounds for the sportsman, including tarpon in the Gulf and leopard cats and Mexican lions across the river. Fort Brown, a picturesque military reservation of 288 acres, with a garrison averaging 400 men, adjoins Brownsville on the east. An annual polo tournament is held there in January. Established by General Zachary Taylor in March 1846, and at first called Fort Taylor, it was renamed in honour of Major Jacob Brown, who was mortally wounded in its defence during the bombardment from across the river (May 3-10, 1846). At Palo Alto, 14m. N.E., and at Resaca de la Palma, 4m. N., General Taylor defeated the Mexicans under General Arista on May 8 and May 9, 1846. There was a small Mexican settlement on the site of Brownsville before the

Mexican War. The town was surveyed in 1848, and named after Major Brown. In 1849 it became an important outfitting-point for gold-seekers on their way to California. For several decades its fortunes fluctuated sharply, and it suffered from yellow fever, fires, Mexican revolutions, speculators, and the machinations of political parties. In 1859 it was captured by Mexican raiders. During the Civil War, until occupied by Federal forces in 1863, it was an active centre of operations by Confederate blockade-runners. The last engagement of the war took place at Palmetto Ranch, near the battlefield of Palo Alto, on May 13, 1865, more than a month after General Lee had surrendered. The present period of the city's development began when the railway from the north reached it in 1904, and is based on the agricultural possibilities of the valley. It has a city-manager form of government.

**BROWN UNIVERSITY**, in Providence, R.I., is the seventh of the nine colleges founded in America before the American revolution. It was projected by the Baptists of Philadelphia, who resisted the religious tests imposed by some of the older institutions and selected the colony founded by Roger Williams as the home of a college where no student should be excluded on theological grounds. In 1763 James Manning submitted to them a draft of a "seminary of polite literature." In 1764 the charter, a landmark in the growth of religious freedom, was granted, and Rhode Island college was established in the town of Warren, James Manning becoming the first president. The first class of seven students was graduated in 1769. A year later the college was moved to Providence and the cornerstone of University hall, "the college edifice" was laid. The infant college keenly felt the shattering force of the Revolution. University hall was given over to the colonial government to serve as barracks for American and French troops, and for nearly seven years the college was closed. Courageously Dr. Manning faced the problem of reopening and rebuilding, and at his death in 1782 the college had a faculty of seven teachers and a graduating class of 21. Nicholas Brown, a leading citizen of Providence, had for years given the enterprise steadfast support, and when he added a gift of \$5,000 (subsequently increased to \$160,000) in 1804, Rhode Island college became Brown university. A few courses for women, given outside the university gates, expanded into the Women's college in Brown university, which in 1897 was formally established as a separate, but co-ordinate institution.

The buildings of the university in 1928 numbered nearly 50, including the John Hay library, containing 350,000 volumes, and the well-known John Carter Brown library, containing rare Americana. Laboratories have been opened in the departments of biology, engineering, chemistry, physics, geology, psychology and botany, new dormitories acquired, and buildings erected for social and religious purposes. Athletic fields have been opened adjacent to the gymnasium, and a health service established with infirmary and medical staff. Provision has been made for moral and religious incentive and a student counsellor placed in charge of religious work. In 1928 the total university endowment was \$9,500,000 and the value of the property over \$5,000,000. The total disbursements for all purposes in that year were \$1,800,000. The faculty had increased to 153 professors and instructors. The students numbered 2,176, in addition to the 2,407 enrolled in part-time or extension courses. While adjusting itself to the changing needs of modern life, the university has in general declined to open professional schools and still devotes its main energies to liberal education. (W. H. P. F.)

**BROWNWOOD**, a city of Texas, U.S.A., 140m. N.W. of Austin; the county seat of Brown county. It is served by the

Frisco and the Santa Fe railway systems. The population in 1920 (94% native white) was 8,223; in 1930 it was 12,789 by the Federal census. The city has two brickyards; ships large quantities of pecans, cotton, cattle, and wool; and is in the midst of a producing oil and gas field. Howard Payne college (Baptist) and Daniel Baker college (Presbyterian), both established in 1889, are located here. Brownwood was settled about 1865. A commission form of government was adopted in 1914.

**BRUAY-EN-ARTOIS**, town in northern France, department of Pas-de-Calais, on the Lawe, 19m. N.N.W. of Arras by road. Pop. (1926) 30,866. It is one of the large coal-mining centres of the north-eastern industrial area of France. There are also large breweries. Bruay was one of the most important mining centres left in French possession during the period 1914-18. By a decree of Jan. 4, 1924 its name was changed from Bruay to Bruay-en-Artois.

**BRUCE**, the name of an old Scottish family of Norman descent, taken from Bruis between Cherbourg and Vallonges. Variations of the name are Braose, Breaux, and Brus. The first Robert de Brus, a follower of William the Conqueror, was rewarded by the gift of many manors, chiefly in Yorkshire, of which Skelton was the principal. His son, the second Robert, received from David I., his comrade at the court of Henry I., a grant of the lordship of Annandale. The fourth Robert married Isabel, natural daughter of William the Lion, and their son, the fifth Robert, married Isabel, second daughter of David, earl of Huntingdon, niece of the same Scottish king. The most famous member of the family is the eighth Robert, "the Bruce," who became king of Scotland in 1306. (See ROBERT THE BRUCE.)

**BRUCE, JAMES** (1730-1794), Scottish explorer in Africa, was born at Kinnaird House, Stirlingshire, on Dec. 14, 1730. He was educated at Harrow and Edinburgh University, and began to study for the bar; but he married a wine merchant's daughter and went into his father-in-law's business. His wife died in Oct. 1754, within nine months of marriage, and Bruce then travelled in Portugal and Spain. The examination of oriental mss. at the Escorial led him to the study of Arabic and determined his future career. In 1758 his father's death placed him in possession of the estate of Kinnaird. On the outbreak of war with Spain in 1762 he submitted to the British Government a plan for an attack on Ferrol, which was not adopted but which led to his appointment as British consul at Algiers, with a commission to study the ancient ruins in that country. In Aug. 1765, a successor in the consulate having arrived, Bruce began his exploration of the Roman ruins in Barbary. Having examined many ruins in eastern Algeria, he travelled from Tunis to Tripoli, and eventually reached Crete, and Syria, visiting Palmyra and Baalbek.

In June 1768 he arrived at Alexandria, having resolved to endeavour to discover the source of the Nile, which he believed to rise in Abyssinia. After visiting Thebes he crossed the desert to Kosseir, where he embarked in the dress of a Turkish sailor. He reached Jidda in May 1769, and after some stay in Arabia he recrossed the Red Sea and landed at Massawa, then in possession of the Turks, on Sept. 19. He reached Gondar, then the capital of Abyssinia, on Feb. 14, 1770. After two years in Abyssinia, on Nov. 14, 1770, he reached the long-sought source of the Blue Nile. Though admitting that the White Nile was the larger stream, Bruce claimed that the Blue Nile was the Nile of the ancients and that he was thus the discoverer of its source. The claim, however, was not well founded (see NILE: *Story of Exploration*). Setting out from Gondar in Dec. 1771, Bruce made his way, in spite of enormous difficulties, by Sennar to Nubia, being the first to trace the Blue Nile to its confluence with the White Nile. On Nov. 29, 1772, he reached Aswan. Bruce returned to Cairo in January 1773, and in March arrived in France, where he was welcomed by Buffon and other *savants*. He went to London in 1774, but, offended by the incredulity with which his story was received, retired to his home at Kinnaird. In 1790 he published *Travels to Discover the Source of the Nile in the Years 1768-73*, in five octavo volumes, lavishly illustrated. Bruce died on April 27, 1794.

He wrote an autobiography, part of which is printed in editions of his *Travels* published in 1805, and 1813, and accom-

FIRST BAPTIST CHURCH, PROVIDENCE, R. I., OLDEST IN AMERICA. SCENE OF BROWN UNIVERSITY "COMMENCEMENTS"

panied by a biographical notice by the editor, Alexander Murray. The best edition of the *Travels* is the third (1813). Of the abridgements the best is that of Major (afterwards Sir Francis) Head, the author of a well-informed *Life of Bruce* (1830). The best account of Bruce's travels in Barbary is contained in Sir R. Lambert Playfair's *Travels in the Footsteps of Bruce* (1877).

**BRUCE, MICHAEL** (1746–1767), Scottish poet, was born at Kinnesswood, Kinross-shire, on March 27, 1746, the son of a weaver, and died at the age of 21 in his native place on July 5, 1767. His parents gave him a good education and he attended four winter sessions at Edinburgh university. In 1766 he wrote his last and finest poem, "Elegy Written in Spring."

His reputation has been spread, first through sympathy for his early death and, secondly, through the alleged theft by John Logan (*q.v.*) of several of his poems. Logan edited in 1770 *Poems on Several Occasions, by Michael Bruce*, in which the "Ode to the Cuckoo" appeared. In the preface he stated that "to make up a miscellany, some poems written by different authors are inserted." In a collection of his own poems in 1781, Logan printed the "Ode to the Cuckoo" as his own.

**BIBLIOGRAPHY.**—Additions to *Poems on Several Occasions* were made by Dr. M'Kelvie in his 1837 edition, with a list of the poems not printed in Logan's selection and those that are lost. See the "Life" in Anderson's *British Poets* (1795); an admirable paper on Bruce in *The Mirror* (No. 36, 1779), said to be by William Craig, one of the lords of session; *The Poetical Works of Michael Bruce; with Life and Writings* (1895), by William Stephen, who, like Dr. A. B. Grosart, *The Works of Michael Bruce* (1865), adopts M'Kelvie's view; and *Life of Michael Bruce, Poet of Loch Leven, with Vindication of his Authorship of the "Ode to the Cuckoo" and other Poems, etc.* (1905), by James Mackenzie.

**BRUCE, STANLEY MELBOURNE** (1883– ), Australian statesman, was born in Melbourne on April 15, 1883, and was educated at Melbourne grammar school, and Trinity hall, Cambridge. He was called to the bar by the Middle Temple in 1907, but shortly afterwards he inherited a partnership in the Melbourne firm of merchants, Paterson, Laing and Bruce. He was again in England when the World War began, received a commission in the Royal Fusiliers, took part in the landing at Suvla bay and was seriously wounded. Later he served in France, was again wounded, and in 1917, was invalided back to Australia. In that year, on the elevation of Sir William Ervine to the chief justiceship of Victoria, he was returned to the Commonwealth Parliament for Flinders. Bruce's political progress was extraordinarily rapid. In 1921 he represented Australia at the second Assembly of the League of Nations. Soon after, Bruce succeeded Sir Joseph Cook as treasurer in the cabinet led by W. M. Hughes (1921–23). In this office, which is second to that of the prime minister, Bruce's knowledge of commerce and law proved extremely useful, and he soon built up a reputation as an essentially sane and level-headed man of affairs rather than an orator or picturesque leader of men. These qualities appealed to a country burdened by heavy war debts and many problems arising out of the war. Bruce profited, too, by the growing dislike of the National Party formed by Hughes during the war. In Feb. 1923 the tottering Hughes ministry fell, and Bruce, as the leader of the Liberal wing of the National Party, succeeded in forming an alliance with the leader of the Country Party, Dr. Earle Page, who took office as treasurer. In 1925, a series of strikes led to a crisis in the shipping trade, and Bruce appealed to the country in a general election in November. The result was a decisive triumph for Bruce, and a heavy defeat for the Labour Party. In imperial affairs he might be described in Bagehot's phrase as an apostle of animated moderation, standing for as warm and close a relationship with Great Britain as is consistent with Australia's interests as a completely self-governing dominion. Under his leadership the Federal Parliament maintained the customs preference to British goods and agreed to a great migration scheme—though the fruits of this latter project were, owing to the difficulties of the states, rather disappointing; and at every opportunity, notably the Imperial Conferences in 1923 and 1926 (see *BRITISH EMPIRE*), he showed himself to be a staunch believer in the future of a British commonwealth of nations with Great Britain as its head. Like Hughes, however, he strongly distrusted any form of imperial federation,

an ideal which was in fact dissipated at the Imperial Conference of 1926 in the report which defined Great Britain and the dominions as "autonomous communities within the British empire."

**BRUCH, MAX** (1838–1920), German composer, son of a city official and grandson of the Evangelical cleric, Dr. Christian Bruch, was born at Cologne on Jan. 6, 1838. From his mother (*née* Almenröder), a well-known musician of her time, he learnt the elements of music, and composition he studied under Breidenstein at Bonn. He was a precocious child, and at 14 produced a symphony. In 1853 he gained the Mozart Stipendium of 400 gulden per annum for four years at Frankfurt-on-Main, where he studied under Hiller, Reinecke and Breuning. From 1858 to 1861 he lived at Cologne, where his first opera (in one act), *Scherz, List und Rache*, was produced in 1858.

On his father's death, in 1861, Bruch began a tour of study at Berlin, Leipzig, Vienna, Munich, Dresden and Mannheim, where his opera, *Lorelei* (libretto by Geibel), was brought out in 1863. At Mannheim he lived till 1864, and there he wrote some of his best-known works, including the beautiful *Frithjof* (*Scenen* for male voices and orchestra). After a further period of travel he became musical-director at Coblenz (1865–67) and Hofkapellmeister at Sondershausen (1867–70), and then lived in Berlin (1871–73), where he wrote his *Odysseus*, his first violin concerto and two symphonies being composed at Sondershausen. After five years at Bonn (1873–78), during which he paid two visits to England, Bruch, in 1878, became conductor of the Stern Choral Union; and in 1880 of the Liverpool Philharmonic. He remained in England for three years. In 1892 he was appointed director of the composition branch of the Berlin Hochschule. From 1910 onwards he lived in retirement near Berlin, at Friedenau, where he died on Oct. 2, 1920.

Though Bruch himself regarded his works for choir with orchestra as his most important contribution to music, and not without justification, since they are of notable excellence, his popular reputation rests on his supremely grateful and effective solo works for the violin and the violoncello, and it is probably by these that he will be longest remembered. Among them are the famous violin concerto in G minor (op. 26), which stands second only to Mendelssohn's in melodiousness and charm, the Romance for violin and orchestra (op. 42), the *Kol Nidrei*, variations for violoncello and orchestra (op. 47), and the *Conzertstück*, for violin and orchestra (op. 84).

**BRUCHSAL**, a town of Germany, in the republic of Baden, 14m. N.E. of Karlsruhe, and an important junction where the Stuttgart line diverges from the main Frankfurt-Basle railway. Pop. (1925) 16,469. Bruchsal (mentioned in 937 as *Bruxolegem*) was originally a royal villa belonging to the emperors and German kings. Given to Otto, duke of Franconia, in 1002 it was inherited by the cadet line of Speyer, the head of which, the emperor Henry III., gave it to the see of Speyer in 1095. St. Peter's church was the burial-place of the bishops, whose summer residence (now used as a prison) lies in the vicinity. In 1190 the bishops bought the *Vogtei* (advocateship) from the counts of Calw, and the place rapidly developed into a town. By the treaty of Lunéville (1802) it was ceded, with other lands of the bishopric on the right bank of the Rhine, to Baden. The Peasants' War during the Reformation period first broke out in Bruchsal. In 1676 and 1698 it was burnt by the French. Bruchsal manufactures machinery, paper, soap, beer, wines and spirits.

**BRUCINE**, one of the alkaloids (*q.v.*) occurring with strychnine (*q.v.*) in various species of *Strychnos*, e.g., in *S. Nux vomica*. (See *Nux Vomica*.) It has a bitter taste and its physiological action, when it is injected subcutaneously in animals, is similar to that produced by strychnine but much feeble; when administered internally it has very little effect owing to the rapidity of its elimination. The method of extraction of brucine is the same as that for strychnine; the brucine crystallizes out when the mixture of alkaloids is washed with dilute alcohol. It is purified by recrystallization from water or alcohol. The crystals form monoclinic prisms, losing their water (2 or 4 molecules) at 100° C, and melting at 105°. Anhydrous brucine, C<sub>23</sub>H<sub>26</sub>O<sub>4</sub>N<sub>2</sub>, melts at 178°, and is laevorotatory in alcohol or chloroform.

**BRUCITE**, a mineral consisting of magnesium hydroxide,  $Mg(OH)_2$ , and crystallizing in the rhombohedral system. It was first described in 1814 as "native magnesia" from New Jersey by A. Bruce, an American mineralogist, after whom the species was named. Brucite is usually found as platy masses, sometimes of considerable size, which have a perfect cleavage parallel to the surface of the plates. It is white, sometimes with a tinge of grey, blue or green, varies from transparent to translucent, and on the cleavage surfaces has a pronounced pearly lustre. In general appearance and softness ( $H=2\frac{1}{2}$ ) it is thus not unlike gypsum or talc, but it may be readily distinguished from these by its optical character, being uniaxial with positive birefringence. The specific gravity is 2.38–2.40.

Brucite is generally associated with other magnesian minerals, such as magnesite and dolomite, and is commonly found in serpentine, or sometimes as small scales in phyllites and crystalline schists; it has also been observed in metamorphosed magnesian limestone, such as the rock known as predazzoite from Predazzo in Tirol. (L. J. S.)

**BRUCKER, JOHANN JAKOB** (1696–1770), German historian of philosophy, born at Augsburg on Jan. 22, 1696, died there on Nov. 26, 1770. He was educated at the University of Jena. In 1723 he became parish minister of Kaufbeuren. In 1731 he was invited to Augsburg as pastor and senior minister of the church of St. Ulrich. His chief work, *Historia Critica Philosophiae*, appeared at Leipzig (5 vols. 1742–44). Owing to its ample collection of material, its success was such that a new edition was published in six volumes (1766–67; English trans. by W. Enfield, 1791). He superintended an edition of Luther's translation of the Old and New Testament, with a commentary extracted from the writings of the English theologians (Leipzig, 1758–70, completed by W. A. Teller).

**BRUCKNER, ANTON** (1824–1896), Austrian musical composer, was born on Sept. 4, 1824, at Ansfelden in Upper Austria. He successfully competed for the organistship for Linz cathedral in 1885. In 1867 he succeeded his former master of counterpoint, Sechter, as organist of the *Hofkapelle* in Vienna, and also became professor in the conservatorium. In 1875 he was appointed to a lectureship in the university. He made a great impression by his extemporizations on the organ, and his success in an organ competition at Nancy in 1869 led to his playing in Paris and London (six recitals at the Albert hall, 1871). His permanent reputation, however, rests on his compositions.

At first church music was the medium in which he best expressed himself. Always humbly obedient to his priest, and never at ease among intellectuals and men of the world, he developed his talent in the composition of masses and other choral works that mark the not unworthy close of a classical (though provincially classical) epoch in Viennese church music—the church music that could not digest Beethoven, though it was not uncongenial to Schubert. The instrumental music of Bruckner's first period is so uncouth that its disinterment is an extraordinary tribute to the triumph of his later symphonies. His Mass in F minor, written in 1868, seems in comparison with his first symphony (produced in that year) like a metropolitan bishop compared with Dominie Sampson. But by 1884 (when he had settled in Vienna) the position is reversed. The grand *Te Deum* (1883–84) has one or two lapses into a style fairly describable as parochial, and seems to belong to a much more primitive art than the sixth symphony, which was finished in 1881. The seventh symphony, finished while the *Te Deum* was in hand, quotes the "*non confundar in aeternum*" in its slow movement, an elegy on the death of Wagner. The effect is almost as if the Wagner of *Parsifal* were to quote not *Lohengrin* (as he does) but *Rienzi*. Bruckner, in the last months of his life, feeling unable to write a finale to his ninth symphony, expressed the wish that this *Te Deum* should be performed in that position. Apart from the fact that Bruckner's ninth symphony has enough naïvely provocative resemblances to Beethoven's without the crowning external feature of a choral finale, conductors who seriously appreciate Bruckner's art find abundant reason for not carrying out this wish; the discrepancy of styles is grotesque. Yet the *Te Deum*

is a fine work with a sledge-hammer Handelian power, alternating with pious meditative passages which have nothing in common with its few lapses into provinciality.

Nevertheless, Bruckner the Wagnerian symphonist is a composer remarkably different from Bruckner the writer of church music; even though he dedicates his ninth symphony *an meinen lieben Gott* the musical sources of his inspiration are two, or rather twin; the opening of Beethoven's ninth symphony and the openings and crescendos of Wagner's *Ring*. These "lapidary" materials (as Bruckner's partisans aptly called them) Bruckner builds into forms quite uncritically taken over from classical tradition, with results whose clumsiness blinds many critics to the grandeur of style and intention. The Great Pyramid would hardly be more out of place in an Oxford quadrangle than Bruckner's Wagnerian climaxes in his four-movement symphonies with their "second subjects" and recapitulations. Nor is it likely that Bruckner would have been much more successful in handling these gigantic things in their legitimate Wagnerian dramatic environment, for even in his last three symphonies he hardly ever frees himself from the trammels of square rhythm; and, as he accepts the classical sonata-forms without inquiry into their meaning or relevance, so he accepts the Wagnerian stage orchestra in its minutest details, without essentially enlarging his own church-organist's mentality.

A hostile criticism long considered the resulting defects more fatal to Bruckner than Berlioz's wildest vagaries are to his weakest works. One of the greatest living conductors actually solemnized a Bruckner festival by producing the fifth symphony with the omission of every alternate pair of bars throughout whole sections! Gray's "Elegy" has survived turning into octosyllables by omitting an adjective in each line. But advocacy finds it discreet to ignore such impieties; for to resent them is to make the awkward confession that they are feasible.

Be this as it may, the reputation of Bruckner's symphonies has survived the hostilities provoked by his historic position as symphonic stalking-horse for the Wagnerians. His influence on younger composers gifted with incomparably greater mastery is now a demonstrable historic fact (see Dohnányi in several works, and Mahler *passim*). And his reputation is increasing (though England remains slow to recognize it) in steady opposition to those fashions which are in revolt against the sublime, the mystical and the idealistic tendencies in art. (D. F. T.)

**BRUGES** (Flemish *Brugge*, a name signifying the bridge or place of bridges) is situated on low-lying ground in the north-east of the Belgian province of West Flanders of which it is the capital. Pop. (1925) 52,894. It is about 6m. from the coast to which it is connected at Zeebrugge and Blankenberghe by a series of canals. Bruges is said to have been a city in the 7th century, and the name Flanders was originally applied to it and not to the district. Baldwin II., count of Flanders, fortified it and made it his chief residence. Before 1180 Bruges was the recognized capital of Flanders and the new counts were proclaimed on the *marché du vendredi*, near the present railway station. After 1180 the premier position was assumed by Ghent, but until access by sea was stopped by the silting up of the Zwyn, which was complete by the year 1490, Bruges was the equal in wealth and power of its neighbour. Bruges was a member of the Hanseatic League and did a considerable trade in wool especially with England. In the 14th century it was the northern counterpart of Venice and its *bourse* regulated the rate of exchange in Europe. Bruges was again important during the 16th century when Spain's increasing trade with the New World demanded that she should have a market in "the main street" of European commerce. The cathedral of St. Sauveur and the church of Notre-Dame, both specimens of early Pointed Gothic, date from the 13th and 14th centuries. The cathedral was much injured by fire in 1839. The church of Notre-Dame contains a fine De Crayer ("The Adoration of the Magi"), and Michelangelo's marble group of the "Virgin and Child." The hospital of St. Jean contains the chief works of Memling, including the famous reliquary of St. Ursula. The market-hall was built in 1561–66 including portions of an older building. The belfry which rises in the centre of the façade

dates from the end of the 13th century and has long been famous for its chime of bells.

The *hôtel de ville* is Gothic and was begun about 1376. The Chapelle du Saint Sang has two storeys, the lower dating from 1150, while the upper was rebuilt in the 15th century, and there is a rich Flamboyant entrance with a stairway (1533). St. Jacques' church is 13th century, but has extensive additions of the close of the 15th and 17th centuries. The Palais de Justice, of the 18th century, on the site of the House of the Franc, contains a fine carved chimney-piece (1530). The house is supposed to have formed part of the residence of the counts of Flanders. The museum contains a representative gallery of early Flemish paintings.

Of the old fortifications three gates remain. The centuries following the struggle with Spain were times of trade depression for Bruges as well as for the rest of Belgium and Bruges lived on its past. At the end of the 19th century a great impetus was given to the trade of the city by the construction of new docks communicating with the sea by a canal 23 ft. deep and by the general improvement of transport between the town and Zeebrugge during the World War. Bruges was distant some 20 m. behind the German front at Dixmude and with the growth of submarine warfare and the abandonment of Ostend as a naval base it became a centre for assembling parts of submarines. By the spring of 1918 the various docks and concrete shelters could accommodate 35 destroyers and about 30 submarines. Little material damage was done to the town, except to the canal docks where enormous numbers of bombs were dropped. The town was in German occupation for four years.

The manufacture of lace gives employment to a great many persons in the town, and horticulture is carried on extensively in the suburbs. Commercial activity has been assisted by the new ship-canal to Zeebrugge and by direct steamship service from Hull to Bruges. The exports are iron, macadam, coke and patent fuel, while nitrates, timber and coal are imported.

**BRUGG**, town of Switzerland. (See under BADEN.)

**BRUGSCH, HEINRICH KARL** (1827-1894), German Egyptologist. He was sent to Egypt by the Prussian Government in 1853, where he met Mariette. He then worked in the Berlin museum. In 1860 he was sent to Persia; in 1864 he was consul at Cairo, and in 1868 he was professor at Göttingen. On the foundation by the khedive of the Cairo school of Egyptology (1870) he was appointed director, a post he held for nine years. He then returned to live in Germany, frequently visiting Egypt until his death. Brugsch's services to Egyptology are most important, particularly in the decipherment of demotic and the making of a vast hieroglyphic-demotic dictionary (1867-82).

**BIBLIOGRAPHY.**—See H. Brugsch, *Mein Leben und mein Wandern*; also article on EGYPT; *Language and Writing*.

**BRÜHL, HEINRICH**, COUNT VON (1700-1763), German statesman at the court of Saxony, was born on Aug. 13, 1700. He was placed as page with the dowager duchess of Weissenfels, and then at the court of Frederick Augustus the Strong, elector of Saxony and king of Poland. Brühl, who began as page and chamberlain, was largely employed in procuring money for his master. He was successively chief receiver of taxes and minister for the interior in 1731. During the whole of the thirty years of the reign of Frederick Augustus II. he was the real inspirer of his master and the practical chief of the Saxon court. After 1738 he was in effect sole minister. The title of prime minister was created for him in 1746. Brühl must therefore be held wholly responsible for the ruinous policy which destroyed the position of Saxony in Germany between 1733 and 1763. His indiscretion was repeatedly responsible for the king of Prussia's discoveries of the plans laid against him. But the confidence of his master survived the ignominious flight into Bohemia, into which he was trapped by Brühl at the time of the battle of Kesseldorf, and all the miseries of the Seven Years' War. The favourite abused the confidence of his master shamelessly. Not content with the 67,000 halers a month which he drew as salary for his innumerable offices, Brühl abstracted more than five million halers of public money for his private use, and left a fortune of 1½ million halers.

He died on Oct. 28, 1763, having survived his master only a few weeks.

His youngest son, HANS MORITZ VON BRÜHL (d. 1811), was, before the Revolution of 1789, a colonel in the French service, and afterwards general inspector of roads in Brandenburg and Pomerania. His son, KARL FRIEDRICH MORITZ PAUL VON BRÜHL (1772-1837), the friend of Goethe, was intendant-general of the Prussian royal theatres, and in 1830 he was appointed intendant-general of the royal museums.

See J. G. H. von Justi, *Leben und Charakter des Grafen von Brühl* (Göttingen, 1760-61).

**BRÜHL**, a town in Rhenish Prussia, south of Cologne. Pop. (1925), 11,170. It is a centre for lignite and briquette and subsidiary industries, and also a resort for the people of Cologne, with a palace (1728) in beautiful grounds.

**BRUMAIRE**, the name of the second month in the republican calendar which was established in France by a decree of the National Convention on Oct. 5 in the year II. (1793), completed with regard to nomenclature by Fabre d'Églantine, and promulgated in its new form on the 4th of Frimaire in the year II. (Nov. 24 1793). The month of Brumaire began on the day which corresponded, according to the year, to Oct. 22 or 23 of the old calendar, and ended on Nov. 20 or 21. Its name alludes to the fogs and mists frequent at that time of the year.

On the republican calendar, see G. Villain, "Le Calendrier républicain," in *La Révolution française* for 1884-85.

**BRUMMAGEM** is an old local form of "Birmingham." The name was first applied to a counterfeit coin made in the city of Birmingham, England, in the 17th century, and later to the plated and imitation articles made there; hence cheap, showy or tawdry. The name was used of the supporters of the Exclusion Bill in 1680, with the meaning of "sham Protestant." Similarly the Tory opponents of the Bill were nicknamed "Anti-Birminghams" or "Anti-Brummagems."

**BRUMMELL, GEORGE BRYAN** (1778-1840), English man of fashion, known as "BEAU BRUMMELL," was born in London on June 7, 1778. His father was private secretary to Lord North from 1770 to 1782, and subsequently high sheriff of Berkshire; his grandfather was a shopkeeper in the parish of St. James, who let lodgings to the aristocracy. From his early years George Brummell paid great attention to his dress. At Eton, where he was sent to school in 1790, and was extremely popular, he was known as Buck Brummell, and at Oxford, where he spent a brief period as an undergraduate at Oriel college, he preserved this reputation, and added to it that of a wit. He returned to London, where the prince of Wales (afterwards George IV.), to whom he had been presented at Eton, gave him a commission in his own regiment (1794). Brummell soon became intimate with his patron, and in 1798, having then reached the rank of captain, he left the service, and next year succeeded to a fortune of about £30,000. Setting up a bachelor establishment in Mayfair, he became, thanks to the prince of Wales's friendship and his own good taste in dress, the recognized *arbiter elegantiarum*. For a time his sway was undisputed. But eventually gambling and extravagance exhausted his fortune, while his tongue proved too sharp for his royal patron. They quarrelled, and, though for a time Brummell continued to hold his place in society, his popularity began to decline. In 1816 he fled to Calais to avoid his creditors. There he struggled on for 14 years, always hopelessly in debt. From 1830 to 1832 he was British consul at Caen. In 1835 he was imprisoned for debt, but his friends once more came to the rescue, and provided him with a small income. He had now lost all his interest in dress; his personal appearance was slovenly and dirty. In 1837, after two attacks of paralysis, shelter was found for him in the charitable asylum of Bon Sauveur, Caen, where he died on March 30, 1840.

See Capt. William Jesse, *Life of Brummell* (1844, rev. ed. 1886); Percy H. Fitzgerald, *Life of George IV.* (1881); R. Boutet de Monvel, *Beau Brummell* (trans. 1908); Lewis Melville, *Beau Brummell, His Life and Letters* (1924).

**BRUNCK, RICHARD FRANÇOIS PHILIPPE** (1729-1803), French classical scholar, was born at Strasbourg, Dec. 30

1739, and died June 12 1803. He was a military commissary during the Seven Years' War; and at the outbreak of the French Revolution was imprisoned. In 1772-76 he edited the *Anthologia Graeca* or *Analecta veterum Poetarum Graecorum*. Where it seemed to him that an obscure passage might be made intelligible by a change of text, he made the alteration, whether the new reading were supported by manuscript authority or not.

Other works include: Editions of Anacreon (1778), plays of Aeschylus and Euripides, Apollonius Rhodius (1780), Aristophanes, with an excellent Latin translation (1781-83), *Gnomici Poetae Graeci* (1784), Sophocles (1786) with Latin translation (his best work), editions of Virgil (1785), Plautus (1788) and Terence (1797).

See Sandys, *Hist. of Classical Scholarship* (1908), vol. ii. p. 395.

**BRUNDISIUM** (mod. BRINDISI, *q.v.*), an important harbour town of Calabria (in the ancient sense), Italy, on the east-south-east coast. The name is said to mean "stag's head" in the Messapian dialect, in allusion to the shape of the harbour. Fertile land made it the chief Messapian city; it became Roman after the conquest of the Sallentini in 266 B.C. The Romans founded a colony there in 245 B.C., and the Via Appia was perhaps extended through Tarentum as far as Brundisium at this period. After the Punic wars it became the chief point of embarkation for Greece and the East, via Dyrrachium or Corcyra, and was made a free port by Sulla. It suffered, however, from a siege conducted by Caesar in 49 B.C. and was again attacked in 42 and 40 B.C. Virgil died here in 19 B.C. on his return from Greece. Trajan constructed the Via Trajana, a more direct route from Beneventum to Brundisium. An ancient column 62 ft. in height, with an ornate capital, still stands, and near it is the base of another, the column itself having been removed to Lecce. They are said to mark the end of the Via Appia.

**BRUNÉ, GUILLAUME MARIE ANNE** (1763-1815), marshal of France, the son of an advocate, was born at Brives-la-Gaillarde (Corrèze), on March 13 1763. He was a member of the Cordeliers' club, and was appointed in 1793 to a superior command in the army direct from civil life. In 1796 he fought under Bonaparte in Italy, and was promoted general of division. In 1798 he commanded the French army which occupied Switzerland, and in 1799 the French troops in Holland when he defended Amsterdam against the Anglo-Russian expedition under the duke of York. In 1807 Brune, who had been promoted marshal in 1804, held a command in north Germany, but he was not afterwards employed during the First Empire. As commander of the army of the Var in 1815 he defended the south of France against the Austrians, and was murdered at Avignon on Aug. 2 1815.

See P. Marmoiton, *Le maréchal Brune* (1900); J. E. Gachot, *Les campagnes de 1799, Brune en Hollande* (1906); P. P. Vermeil de Conchard, *Études historiques sur le Maréchal Brune* (1918).

**BRUNEAU, ALFRED** (1857- ), French musical composer, was born in Paris on March 3, 1857, and was educated at the Paris conservatoire, where he gained the 2nd Grand Prix for composition. He played the violoncello in Pasdeloup's orchestra, and soon began to compose. In 1884 his *Ouverture héroïque* was performed and this was followed by the choral symphonies, *Léda* (1884), *La Belle au Bois Dormant* (1886) and *Penthésilée*. But it is as a dramatic composer that Bruneau is best known. In 1887 his first opera, *Kérin*, was produced and in 1891 came his successful opera *Le Rêve*, with a libretto founded on Zola's story. This opera, a work of striking originality and power, may be said to have influenced to a great extent the subsequent development of the modern French school. Another subject from Zola resulted in the opera *L'Attaque du Moulin* (1893) and thereafter Zola himself commenced to write libretti expressly for Bruneau. They produced together *Messidor* (1897), *L'Ouragan* (1901) and *L'Enfant Roi* (1905). After Zola's death Bruneau continued to draw on his works, making his own adaptations. Among Bruneau's other compositions may be mentioned his *Requiem* (1896), a notable work, and his two collections of songs, *Lieds de France* and *Chansons à Danser*. Although *Le Rêve* greatly divided critical opinion at first, its merits subsequently won general recogni-

tion, no less applying to *L'Attaque du Moulin*, one of the most powerful and effective war operas ever written. Bruneau, who was awarded the Decoration of the Légion d'Honneur in 1895, has written admirably on his art and was one of the foremost of French musical critics.

See Octave Séré, *Musiciens français d'aujourd'hui* (1911) and Arthur Hervey, *Alfred Bruneau* (1907).

**BRUNEI**, a protected British State in the north-west of Borneo, included northern Borneo and southern Palawan, and stretched down the coast as far as Sambas. What remains of this once powerful sultanate is a triangular-shaped territory, the base of the triangle being represented by 80 m. of coastline, and the two sides by the frontiers of Sarawak. The area is variously given as 4,000 and 5,000 sq. m. but is much nearer 3,000. This great reduction has been brought about by the cession on successive occasions of strips of territory to Sarawak and to the British North Borneo Company on condition of annual payments of money. The Sultan Mohammed Jamal-ul-alam, K.C.M.G., who succeeded his father in 1906, died in 1924. The present Sultan is a minor, and the country is ruled by two regents. The sultan receives an allowance of 12,000 dollars a year from State funds, and his two principal ministers receive allowances of 6,000 dollars a year each.

The bulk of the inhabitants, Malays, Kadayans, Orang Bukits and a few Muruts, live in and about the capital—also called Brunei—the population of the city being estimated at about 15,000, and the whole territory at 25,000 to 30,000. The city is prettily situated on the river, with a background of cleared hills, and in the distance heights clothed with magnificent forest. The dwelling-houses are built over the river on slender piles of Nibong palm which resists the action of the water for several years. Some of the natives are skilled workers of brass, and the Brunei women make very beautiful cloth, interwoven and embroidered with gold thread. Sago is worked in the important river-valleys of the Tutong and the Balait, but only a small quantity of rice is cultivated.

Since the War the trade of Brunei with the outside world and the interior tribes of Sarawak and British North Borneo has shown steady development. In 1921 exports of cutch, rubber, sago, hides and horns, brassware, etc., were valued at \$791,028; in 1923 at \$900,307, and in 1925 at \$1,859,736. The jump in 1925, the year when rubber touched 4s. per lb., was however mainly due to the output of the rubber plantations of which Brunei possesses some admirable examples. Imports of rice, tobacco, piece goods, sugar, preserved provisions, kerosene oil, etc., were valued in 1921 at \$410,854, 1923 \$470,463, and in 1925 at \$1,013,418. In 1925 the revenue of the country was \$315,261 and the expenditure \$245,286, giving a surplus of \$69,975.

The history of this ancient and decaying sultanate is of some interest. Brunei, or, as it is called by the natives Bruni or Daru-Salam (city of peace), possesses an historic tablet of stone upon which, in A.H. 1221 (1804), was engraved in Malay characters the genealogy of the sovereigns who have ruled over the country. The book of descent is kept in the palace by the sultan. The other heirlooms, which are also kept in the sultan's palace, and descend to each sultan in turn, are the "Nobab Nagara" (two royal drums) from Johore and Menang-Kabau, and the "Gunta Alam" (bells of emblem), the gift of Sultan Bahkei of Johore or Malacca. The first sultan of Brunei was Alak-ber-Tata, who was probably of Bisaya stock, and governed the country before the introduction of Islam, in the 15th century. He assumed the name of Mohammed on his conversion to Islam, which was brought about during a visit to the Malay Peninsula. Brunei at this time was a dependency of Majapahit (Java), and paid a yearly tribute of a jar of areca juice of no monetary value. The Hindu kingdom of Majapahit was destroyed by the Mohammedans in 1478, and Brunei is mentioned in the history of Java as one of the countries conquered by Adaya Mingrat, the general of Angka Wijaya. Sultan Berkat, an Arab sheriff of high rank, from the country of Taif in Arabia, who had married a niece of Alak-ber-Tata, built a large mosque and enforced Mohammedan law, and with the assistance of the Chinese built the stone wall (which is still in

existence between the islands of Kaya Orang and Chermin), by sinking 40 junks filled with rock across the mouth of the Brunei river. This work was completed before the arrival of Pigafetta in 1521. In the reign of Sultan Bulkeiah Magellan's squadron anchored off the mouth of Brunei river in August 1521, and Pigafetta makes mention of the splendid court and the imperial magnificence of the Borneo capital. Sultan Bulkeiah was otherwise known as Nakoda Ragam; he was the greatest warrior of Brunei and made military expeditions to Java, Malacca, Luzon and all the coasts of Borneo. His tomb, which is handsomely built of stone, is still to be seen in Brunei, and is constantly visited by Malays, who leave money and various articles on the tomb as offerings to his memory. Others, again, come and take away anything they can find, which they keep as charms and mementoes. The Spaniards captured Brunei in 1580, the reigning sultan and his court retiring to Suai in the Baram district. The invaders were compelled to evacuate the place, however. Brunei's golden age was nevertheless at an end. The East India Company started a factory in the town in the 18th century, but commerce had already decayed and the establishment was abandoned. In the early part of the 19th century Brunei was but a resort for pirates and a market for the slave trade. During the 'forties Admiral (then Captain) Keppel and other officers of the British navy suppressed piracy in the neighbourhood. Sarawak (*q.v.*) was handed over to Raja Brooke, and, after the capture and temporary occupation of Brunei by Sir Thomas Cochrane, Labuan was ceded to the British empire. From this island it was possible to exercise a certain control over the townspeople, and a consul was stationed there to watch affairs. In 1888 Brunei was placed under British protection. On January 2 1906, a treaty was made whereby the Sultan agreed to hand over the administration to a British resident. Brunei, with Labuan, thus became a part of the British Empire, much in the position of an unfederated Malay State.

**BIBLIOGRAPHY.**—See Sir Hugh Low, *Silsilah (Book of the Descent) of the Rajas of Brunei*; *Journal of the Straits Branch of the Royal Asiatic Society*, June 1880. (C. H.; E. S.)

**BRUNEL, ISAMBARD KINGDOM** (1806–1859), English engineer, the designer of the first transatlantic steamer, only son of Sir M. I. Brunel, was born at Portsmouth on April 9, 1806. At 14 he was sent to Paris, to study at the Collège Henri Quatre. In 1823 he entered his father's office as assistant-engineer, just at the time when the project of the Thames tunnel was beginning to take shape; and from 1825, when the work was begun, till 1828, when it was stopped by an irruption of the river, he was both nominal and actual resident engineer. He designed (1831) the suspension bridge over the Avon at Clifton, which was not completed until 1864, and in 1841–45, built the old Hungerford suspension bridge (London), displaced in 1862 by the Charing Cross railway bridge.

In March 1833 Brunel, at the age of twenty-seven, was appointed engineer of the newly-projected Great Western railway. The famous "battle of the gauges" arose out of his introduction of the broad (7ft.) gauge on that line. The last and greatest of Brunel's railway works was the Royal Albert bridge over the river Tamar at Saltash, constructed between 1853 and 1859.

Brunel took a leading part in the systematic development of ocean steam navigation. As early as October 1835 he had suggested to the directors of the Great Western railway, that they should "make it longer, and have a steamboat to go from Bristol to New York, and call it the Great Western." The project was then taken up and the "Great Western" steamship designed by Brunel, and built (1838) at Bristol under his superintendence, was the first steamship built to make regular voyages across the Atlantic. He then designed the "Great Britain," which was the first large iron steamship, the largest ship afloat at that time, and the first large ship in which the screw-propeller was used. She made her first voyage from Liverpool to New York in 1845. Brunel's conception of a "great ship" was realized in the gigantic vessel, the "Great Eastern," put afloat on Jan. 31, 1858, but her engineer, overworked and worn out with worry, broke down and did not see her begin her first voyage on Sept. 7, 1859. On Sept.

15 he died at his house in Westminster.

Brunel was employed in the construction of many docks and piers, as at Monkwearmouth, Bristol, Plymouth, Briton Ferry, Brentford and Milford Haven. He was a zealous promoter of the Great Exhibition of 1851, and was a member of the committee on the section of machinery and of the building committee. He paid much attention to the improvement of large guns, and designed a floating gun-carriage for the attack on Kronstadt in the Russian War (1854); he also designed and superintended the construction of the hospital buildings at Erenkeui on the Dardanelles (1855).

See *The Life of I. K. Brunel, C.E.* (1870), by his son, Isambard Brunel.

**BRUNEL, SIR MARC ISAMBARD** (1769–1849), inventor and engineer, was born at Hacqueville, Normandy, on April 25, 1769. He served for six years in the navy. When his ship was paid off in 1792 and he returned to France, he found the Revolution at its height, and owing to his pronounced royalist opinions he was obliged to leave the country. Reaching New York in Sept. 1793 he began to practise as an architect and civil engineer. He designed and superintended the construction of the Bowery theatre, New York, burnt down in 1821. He fitted novel and ingenious machinery in the arsenal and cannon factory which he was commissioned to erect in New York. In 1799 he sailed for England to submit to the British government his plans for the mechanical production of ships' blocks in substitution for the manual processes then employed. After the usual difficulties and delays his proposals were adopted, largely through the recommendation of Sir Samuel Bentham, and about 1803 the erection of his machines was begun at Portsmouth dockyard. They formed one of the earliest examples of a complete range of machine tools, each performing its part in a long series of operations. Brunel devised improved machines for sawing and bending timber, and in the years 1811 and 1812 he was employed by the government in erecting saw-mills at Woolwich and Chatham. He also interested himself in steam navigation on the Thames between London and Ramsgate, and spent much time and money in an attempt to use liquefied gases as a source of motive-power. His round stocking-frame or *tricoteur* was patented in 1816, and among his other inventions were machines for winding cotton-thread into balls, for copying drawings, for making small wooden boxes such as are used by druggists, and for the manufacture of nails, together with processes of preparing tinfoil for decorative purposes and improvements in stereotype plates for printing.

In 1821 he had financial difficulties and was thrown into prison for debt, only regaining his freedom through a grant of £5,000 which his friends obtained for him from the government. In 1820 he had prepared plans of bridges for erection in Rouen and St. Petersburg and in the island of Bourbon. In 1823 he designed swing-bridges, and in 1826 floating landing-stages, for the port of Liverpool. A company was formed in 1824 to carry out his scheme for boring a tunnel under the Thames between Wapping and Rotherhithe. The work was completed in 1843. Brunel died in London on Dec. 12, 1849. He received the order of the Legion of Honour in 1829 and was knighted in 1841.

See Richard Beamish, *Memoirs of Sir Marc Isambard Brunel* (1862).

**BRUNELLESCHI or BRUNELLESICO, FILIPPO** (1379–1446), Italian architect, the reviver of the Roman or Classic style, was born at Florence in 1379. His father, a notary, observing the boy's talent for all sorts of mechanism, placed him in the gild of goldsmiths. Filippo quickly perfected himself in the knowledge of sculpture, perspective and geometry. In 1401 he was one of the competitors for the design of the gates of the baptistery of San Giovanni. He was unsuccessful, though his work obtained praise, and he soon afterwards set out for Rome. He studied hard, and was one of the first to apply the scientific laws of perspective to his work. In 1407 he returned to Florence, just at the time when it was resolved to attempt the completion of the cathedral church of Santa Maria del Fiore. Brunelleschi's plan for effecting this by a cupola was approved, but it was not till 1419 that the work was finally entrusted to him. He did not

live to see the completion of the great cupola, one of the triumphs of architecture exceeding in some measurements that of St. Peter's at Rome, and has a more massive and striking appearance. His other masterpieces are the Pitti palace at Florence, on the pattern of which are based the Tuscan palaces of the 15th century, the churches of San Lorenzo and Spirito Santo, and the still more elegant Capella dei Pazzi. The beautiful carved crucifix in the church of Santa Maria Novella in Florence is also the work of Brunelleschi. He died in Florence on April 16 1446, and was buried in the cathedral church of his native city.

See Manetti, *Vita di Brunelleschi* (Florence, 1812); Guasti, *La cupola di Santa Maria del Fiore* (Florence, 1857); von Fabriczy, *Filippo Brunelleschi* (Stuttgart, 1892).

**BRUNET, JACQUES CHARLES** (1780-1867), French bibliographer, was born in Paris. He was the son of a bookseller, and in 1802 he printed a supplement to the *Dictionnaire bibliographique de livres rares* (1790) of Duclos and Cailleau. In 1810 there appeared the first edition of his *Manuel du libraire et de l'amateur des livres*. Brunet published successive editions of his great bibliographical dictionary, which rapidly became the standard work on the subject. Among his other works are *Nouvelles Recherches bibliographiques* (1834), *Recherches . . . sur les éditions originales de Rabelais* (1852) and an edition of the French poems of J. G. Alione d'Asti, dating from the beginning of the 16th century (1836).

See a notice by Le Roux de Lincy, prefixed to the catalogue (1868) of his own valuable library. A supplement to the 5th ed. (1860-65) of the *Manuel du libraire* was published (1878-80) by P. Deschamps and G. Brunet.

**BRUNETIÈRE, FERDINAND** (1849-1906), French critic and man of letters, was born at Toulon and educated at Marseilles and the Lycée Louis-le-Grand. He became connected with the *Revue des Deux Mondes*, first as contributor, then as secretary and sub-editor, and finally, in 1893, as principal editor. In 1886 he was appointed professor of French language and literature at the École Normale, a singular honour for one who had not passed through the academic mill. He became a member of the Academy in 1893. His published works include six series of *Études critiques* (1880-98) on French history and literature; *Le Roman naturaliste* (1883); *Histoire et Littérature*, three series (1884-86); *Questions de critique* (1888; second series, 1890). The first volume of *L'Évolution de genres dans l'histoire de la littérature*, lectures in which a formal classification, founded on the Darwinian theory, is applied to the phenomena of literature, appeared in 1890; and his later works include a series of studies (1894) on the evolution of French lyrical poetry during the 19th century, a history of French classic literature begun in 1904, a monograph on Balzac (1906) and various polemical pamphlets. Brunetière was an orthodox Roman Catholic, and his political sympathies were in the main reactionary. He possessed two prime qualifications of a great critic, vast erudition and unflinching courage. He was never afraid to diverge from the established critical view, his mind was closely logical and intensely accurate, and he rarely made a trip in the wide field of study over which it ranged.

His *Manual of the History of French Literature* was translated into English in 1898 by R. Derechef. Among critics of Brunetière see J. Lemaitre, *Les Contemporains* (1887, etc.), and J. Sargeret, *Les Grands Convertis* (1906).

**BRUNHILD**, the name of a mythical heroine of various versions of the legend of the Nibelungs. The name means "the warrior woman in armour," and in the Norse versions of the Nibelung myth, which preserve more of the primitive traditions than the *Nibelungenlied*, Brunhild is a valkyrie, the daughter of Odin, by whom, as a punishment, she has been cast under a spell of sleep on Hindarfjell, a lonely rock, until the destined hero shall penetrate the wall of fire by which she is surrounded, and wake her. This is a variant of the widespread myth which survives in the popular fairy-story of "the sleeping beauty." In the *Volsungasaga* Brunhild is the heroine of a tragedy of passion and wounded pride; it is she who compasses the death of Sigurd, who has broken his troth pledged to her, and then immolates herself on his funeral pyre in order that in the world of the dead he may be wholly hers.

In the *Nibelungenlied*, on the other hand, she plays a comparatively colourless rôle. She still possesses superhuman attributes; like Atalanta, she can only be won by the man who is able to overcome her in trials of speed and strength; but, instead of a valkyrie sleeping on a lonely rock, she is (when Sigfrid goes to woo her on behalf of Gunther) queen of Islant (Isenlant), living in a castle called the Isenstein. The poet of the *Nibelungenlied* evidently knew nothing of the tale of her self-immolation; for, though he has nothing definite to say about her after Sigfrid's death, he keeps her alive in a sort of dignified retirement. (See further under NIBELUNGENLIED.)

**BRUNHILDA** (Brunechildis), queen of Austrasia (d. 613), was a daughter of Athanagild, king of the Visigoths. In 567 she was asked in marriage by Sigebert, who was reigning at Metz. She now abjured Arianism and was converted to the orthodox faith. Chilperic, brother of Sigebert, and king of the west Frankish kingdom, jealous of the renown which this marriage brought to his elder brother, married Brunhilda's sister, but soon assassinated her at the instigation of his mistress Fredegond. Sigebert was anxious to avenge his sister-in-law, but accepted the compensation offered by Chilperic, namely the cities of Bordeaux, Cahors and Limoges, with Béarn and Bigorre.

This treaty did not prevent war soon again breaking out between Sigebert and Chilperic. So long as her husband lived, Brunhilda played a secondary part, but having been made captive by Chilperic after her husband's assassination (575), she escaped, after a series of extraordinary adventures, by means of a marriage with Merovech, the son of her conqueror. From this time on, she took the lead; in Austrasia she opposed the nobles, who wished to govern in the name of her son Childebert II.; but she was worsted and had to seek refuge in Burgundy. After the death of Childebert II. (597) she aspired to govern Austrasia and Burgundy in the name of her grandsons Theudebert and Theuderich II. She was expelled from Austrasia, and then stirred up Theuderich II. against his brother, whom he defeated and put to death. Theuderich II. died shortly after this victory, and Brunhilda caused one of her great-grandchildren to be proclaimed king. The nobles of Austrasia and Burgundy, however, summoned Clotaire II., son of Fredegond, to help them against the queen. Brunhilda was given up to him, and put to death (613).

Brunhilda seems to have had political ideas and to have wished to attain to the royal power. She was a protectress of the Church, and Pope Gregory I. (590-604) addressed a series of letters to her, in which he showered praises upon her. She took it upon herself, however, to supervise the bishoprics and monasteries, and came into conflict with Columban, abbot of Luxeuil.

**BIBLIOGRAPHY.**—Gregory of Tours, *Historia Francorum*, bks. iv.-x.; the so-called *Chronicle of Fredegarius*; Aug. Thierry, *Récits des temps mérovingiens* (8th ed., 1864); G. Kurth, "La Reine Brunehaut," in the *Revue des questions historiques*, vol. xxvi. (1891).

**BRUNI, LEONARDO** (1369-1444), Italian scholar, author of a history of Florence, was born at Arezzo, and is generally known as Leonardo Aretino. Bruni advanced the study of Greek literature by many literal translations from the Greek classics. He was secretary to the papal chancery (from 1405) under Innocent VII. and John XXII. From 1427 to his death (Mar. 9, 1444) he was chancellor to the republic of Florence. He was the first to free the history of Florence from its fabulous elements, but his book, on which he was engaged in 1415, though not unintelligible, only repays very laborious study. The only Latin edition is *Historiarum Florentinarum libri xii. . . . exempto in lucem edit. stud. et op. Sixti Brunonis* (Argentor. 1610, fol.). A translation into Tuscan was published by Donato Acciajuoli in 1476 at Venice, was republished at Florence in 1492, and again with Sansovino's continuation, at Venice in 1561. He also wrote lives of Petrarch and Dante in the vernacular.

**BRÜNN:** see BRNO.

**BRUNNER, HENRY** (1840-1915), German historian, was born at Wels, Upper Austria, June 22 1840, and died at Bad Kissingen Aug. 11 1915. He became professor at the University of Lemberg (Lwów) in 1866, then at Prague, at Strasbourg and in 1873 at Berlin. From 1872 Brunner devoted himself especially to

studying the early laws and institutions of the Franks and kindred peoples of western Europe and on these subjects his researches have been of supreme value. He also became a leading authority on modern German law. In 1886 after the death of G. Waitz, he undertook the supervision of the *Leges* section of the *Monumenta Germaniae historica*.

His most important works are: *Deutsche Rechtsgeschichte* in vols. i. and ii. of Bindung's *Handbuch der deutschen Rechtswissenschaft* (1887-92); and *Grundzüge der deutschen Rechtsgeschichte* (1901, 6th ed. 1917).

**BRÜNNOW, FRANZ FRIEDRICH ERNST** (1821-1891), German astronomer, was born in Berlin on Nov. 18 1821. After graduating as Ph.D. at Berlin in 1843, he worked at the Berlin observatory, under J. F. Encke, contributing numerous important papers on the orbits of comets and minor planets to the *Astronomische Nachrichten*. In 1847 he was appointed director of the Bilk observatory, near Düsseldorf, and in the following year published the *Mémoire sur la comète elliptique de De Vico*. In 1851 he succeeded J. G. Galle as first assistant at the Berlin observatory, and accepted in 1854 the post of director of the new observatory at Ann Arbor (Mich.) U.S.A. Here he published, 1858-62, a journal entitled *Astronomical Notices*, while his tables of the minor planets Flora, Victoria and Iris were severally issued in 1857, 1859 and 1869. In 1860 he went, as associate director of the observatory, to Albany (N.Y.); but returned in 1861 to Michigan. In 1863 he returned to Germany; then, on the death of Sir W. R. Hamilton in 1865, he accepted the post of Andrews professor of astronomy in the university of Dublin and astronomer-royal of Ireland. His first undertaking at the Dublin observatory was the erection of an equatorial telescope to carry the fine object-glass presented to the university by Sir James South; and on its completion he began an important series of researches on stellar parallax. The first, second and third parts of the *Astronomical Observations and Researches made at Dunsink* contain the results of these labours, and include discussions of the distances of the stars  $\alpha$  Lyrae,  $\sigma$  Draconis, Groombridge 1830, 85 Pegasi, and Bradley 3077, and of the planetary nebula H. iv. 37. In 1874 he retired to Basle. He died at Heidelberg on Aug. 20 1891. His *Lehrbuch der sphärischen Astronomie* was widely appreciated. In 1860 part i. was translated into English by Robert Main, the Radcliffe observer at Oxford; Brünnow himself published an English version in 1865. A fifth edition of the original was published in 1881, and it was also translated into French, Russian, Italian and Spanish.

See *Month. Notices Roy. Astr. Soc.*, lii. 230; J. C. Poggendorff's *Biog. Lit. Handwörterbuch*, Bd. iii.; *Nature*, xlv. 449.

**BRUNO, SAINT**, founder of the Carthusians, was born in Cologne about 1030; he was educated there and afterwards at Reims and Tours, where he studied under Berengarius (q.v.). He was ordained at Cologne, and in 1057, recalled to Reims to become head of the cathedral school and overseer of the schools of the diocese. He was made also canon and diocesan chancellor. Having protested against the misdoings of a new archbishop, he was deprived of all his offices and had to fly for safety (1076). On the deposition of the archbishop in 1080, Bruno was presented by the ecclesiastical authorities to the pope for the see, but Philip I. of France successfully opposed the appointment. After this Bruno retired, with six companions, to the mountains near Grenoble, and there founded the Carthusian order (1084). After six years Urban II. called him to Rome and offered him the archbishopric of Reggio; but he refused it, and withdrew to a desert in Calabria, where he established two other monasteries. He died in 1101. His Commentaries on the Psalms and the Pauline Epistles are to be found in Migne, *Patr. Lat.* clii. and cliii.

See his *Life* in the Bollandists' *Acta Sanctorum* (Oct. 6), also Hermann Löbbel, *Der Stifter des Karthäuser-Ordens*, 1899 (vol. v. of "Kirchengeschichtliche Studien," Münster).

**BRUNO** or **BRUN** (925-965), archbishop of Cologne, third son of the German king, Henry I., the Fowler, was educated for the church at Utrecht. In 940 his brother, King Otto, afterwards Emperor Otto the Great, appointed him chancellor, and under his leadership the chancery was reformed and became a training ground for capable administrators. He helped his brother Otto

to suppress the risings which marked the earlier part of his reign, services which were rewarded in 953 when Bruno was made archbishop of Cologne, and about the same time duke of Lorraine. Bruno consorted eagerly with learned foreigners, tried to secure a better education for the clergy, and was mainly instrumental in making his brother's court the centre of intellectual life in Germany. He built many churches, and, aided by the tendency of the time, sought to purify monastic life. He died at Reims, Oct. 11, 965, and was buried in the church of St. Pantaleon at Cologne.

See Ruotger, "Vita Brunonis archiepiscopi Coloniensis," in Migne, *Patrol. Lat.* v. 134; E. Meyer, *De Brunone I. Archiepiscopo Coloniensi* (1867); J. P. Pfeiffer, *Historisch-Kritische Beiträge zur Geschichte Bruns I.* (Cologne, 1870); K. Martin, *Beiträge zur Geschichte Bruns I. von Köln* (Jena, 1878).

**BRUNO, GIORDANO** (c. 1548-1600), Italian philosopher, was born near Nola. In 1563 he became a Dominican at Naples, but later, on account of his views on transubstantiation and on the Immaculate Conception, he was forced to leave Italy. In 1579 he reached Geneva, the home of Calvinism. Finding himself out of harmony there he wandered on through Toulouse, where he lectured on philosophy, arriving at Paris in 1581. There he delivered lectures on the logical system of Raymund Lully and wrote the *De Umbris Idearum, Ars Memoriae, De compendiosa architectura et complemento artis Lullii, Cantus Circaeus* and the satiric comedy, *Il Candelajo*. In 1583 Bruno travelled to England where, in spite of his disgust with English manners and the pedantry of Oxford, he produced his best works: *Cena de la Ceneri* (a criticism of English social life and an exposition of the Copernican theory), *Della Causa, Principio ed Uno and Del' Infinito, Universo e Mondi* (metaphysical works), *Eroici Furori, Cabala del Cavallo Pegaseo* and *Spaccio della Bestia Trionfante*. The *Spaccio* is an allegory treating of moral philosophy and expressing his opposition to religion; it exalts truth, prudence, wisdom, law and judgment, and at the same time scoffs at the mysteries of faith and places the Jewish record on a level with Greek myths.

In 1585-86 Bruno returned to Paris but wandered on to Marburg and Wittenberg, the headquarters of Lutheranism, where he wrote a number of logical treatises. The Calvinists proving too much for him, in 1588 he went to Prague, then to Helmstadt and Frankfurt, where in 1590 he published three important metaphysical works: *De Triplici Minimo et Mensura; De Monade, Numero, et Figura; De Immenso et Innumerabilibus*. We find him next at Zürich, whence he accepted an invitation to Venice. This led to the emissaries of the Inquisition bringing him to Rome in 1593, where he was imprisoned for seven years before he was excommunicated and burnt at the stake on Feb. 17, 1600.

Apart from his disdainful, boasting nature and his attack on contemporary Christianity, the chief causes of Bruno's downfall were his rejection of the Aristotelian astronomy for that of Copernicus, which allowed for the possibility of innumerable worlds, and his pantheistic tendencies. Inspired by the Stoics, the Neoplatonists, and above all by Nicholas of Cusa, Bruno asserted that amid all the varying phenomena of the universe there is something which gives coherence and intelligibility to them and this something is God, the universal, unifying substance, from which all things come of necessity. As a manifestation of God, the universe must be infinite and animated, but being itself difficult to comprehend it gives no true knowledge of God, who is far removed from His effects. As the unity in all things, God may be called the *monas monadum*, every other thing being a *Monas* or self-existent, living nature, a universe in itself. The human soul is a thinking monad whose highest function is the contemplation of the Divine unity and whose destiny is immortality as a portion of the Divine life. In the later Latin treatises these pantheistic tendencies are moderated, the universe appearing as the realization of the Divine mind.

**BIBLIOGRAPHY.**—Bruno's writings were brought into notice by Jacobi's *Briefe über die Lehre Spinozas* (2nd ed., 1879). The chief edition of the Latin works is that by F. Fiorentino, F. Tocco and H. Vitelli (Naples, 1879-91). The best edition of the Italian works is that by B. Croce and G. Gentile (1907, foll.), with notes by the latter. English translations are: *The Spaccio* by Morehead (1713); the preface to *Del' Infinito* (J. Toland in posthumous works); *Eroici Furori* by L. Williams (1888). The most important critical works are perhaps those of F. Tocco: *Le Opere Latine di Giordano Bruno* (Florence,

1889); *Le Opere Inedite di Giordano Bruno* (Naples, 1891); *Le Fonte più recenti della filos. del Bruno* (Rome, 1892).

(Messina, 1921); Berti, *Giordano Bruno da Nola* (2nd ed., 1889); H. Brunnhofer, *Giordano Bruno Weltanschauung* (Leipzig, 1883); F. J. Clemens, *Giordano Bruno und Nicolaus von Cusa* (Bonn, 1847); A. Riehl, *G. Bruno* (1900; Eng. trans. Agnes Fry, 1905); Atanassievitch, *La doctrine métaphysique et géométrique de Bruno* (Belgrade, 1923); E. Namer, *Les Aspects de Dieu dans la Philosophie de Bruno* (1926); J. R. Charbonnel, *L'Éthique de G. Bruno* (1919); R. Adamson, *Development of Modern Philosophy* (1903); G. Gentile, *Giordano Bruno nella Storia della cultura* (1907).

**BRUNO, PAUL** (1874- ), German architect and painter, born Jan. 19 1874, at Seifhennersdorf in Saxony, first made a name as an artist by his drawings for *Simplizissimus*. Later his designs for the Münchner Werkstätte (Fine arts industry) attracted attention. In 1900 he received the Grand Prix in Paris; in 1902 the highest distinction at Turin; in 1904, the Grand Prix at St. Louis; and in 1906 the highest distinction at Dresden. In 1907 he was appointed director of instruction at the State Museum of Applied Arts in Berlin. He wrote a pamphlet on *The Education of Artists at State Schools* (1919), which has become a classic.

**BRUNO OF QUERFURT, SAINT** (BONIFACIUS) (975?-1009), German missionary bishop and martyr, belonged to the family of the counts of Querfurt in Saxony. He was educated at the famous cathedral school at Magdeburg, and at the age of 20 was attached to the clerical household of the emperor Otto III. In 997 he accompanied the emperor to Rome, but there entered the monastery of S. Alexius taking "in religion" the name of Bonifacius. When the news reached Rome of the martyrdom of Adalbert, bishop of Prague (997), Bruno determined to take his place, and in 1004, after being consecrated by the pope as archbishop of the eastern heathen, he set out for Germany to seek aid of the emperor Henry II. The emperor, however, being at war with Boleslaus of Poland, opposed his enterprise, and he went first to the court of St. Stephen of Hungary, and, finding but slight encouragement there, to that of the grand prince Vladimir at Kiev. He was so successful in converting the pagan Pechenegs who inhabited the country between the Don and the Danube that they made peace with the grand prince and were for a while nominally Christians. In 1008 Bruno went again to the court of Boleslaus, and, after a vain effort to persuade the emperor to end the war between Germans and Poles, determined at all hazards to proceed with his mission to the Prussians. With 18 companions he set out; but on the borders of the Russian (Lithuanian) country he and his company were massacred by the heathens (Feb. 14, 1009).

During his stay in Hungary (1004) Bruno wrote a life of St. Adalbert, the best of the three extant biographies of the saint (in Pertz, *Mon. Germ. Hist. Scriptores*, iv. pp. 577, 596-612).

A life of St. Bruno was written by Dietmar, bishop of Merseburg (976-1019). This, with additions from the life of St. Romuald, is published in the Bollandist *Acta Sanctorum* (Feb. 14). See further U. Chevalier, *Répertoire des sources historiques*; D. H. Voigt, *Brun von Querfurt* (Stuttgart, 1907).

**BRUNSBÜTTEL** and **BRUNSBÜTTELKOOG**, a seaport of Germany, in the Prussian province of Schleswig-Holstein, on the northern bank of the Elbe, 60m. N.W. of Hamburg. Combined population (1925) 7,835. Brunsbüttel is the western terminus of the Kiel canal, which is closed there by double locks. There is also an inner harbour, 1,640ft. by 656ft., and a coaling station.

**BRUNSWICK, KARL WILHELM FERDINAND, DUKE OF** (1735-1806), German general, was born on Oct. 9, 1735, at Wolfenbüttel. He received an unusually wide and thorough education, and travelled in his youth in Holland, France and various parts of Germany. His first military experience was in the North German campaign of 1757, under the duke of Cumberland. At the battle of Hastenbeck he won great renown by a gallant charge at the head of an infantry brigade; and upon the capitulation of Kloster Zeven he was easily persuaded by his uncle, Ferdinand of Brunswick, who succeeded Cumberland, to continue in the war as a general officer. After the close of

the Seven Years' War, the prince visited England with his bride, the daughter of Frederick, prince of Wales, and in 1766 he went to France, being received both by his allies and his late enemies with every token of respect. After visiting Switzerland, Rome and Naples he returned to Paris, and thence to Brunswick. With the assistance of the minister, Féronce von Rotenkreuz, he rescued the state from the bankruptcy into which the war had brought it. His popularity was unbounded, and when he succeeded his father, Duke Karl I., in 1780, he was a model sovereign. He was perhaps the best representative of the benevolent despot of the 18th century—wise, economical, prudent and kindly. He strove to keep his duchy from all foreign entanglements, and at the same time he continued to render important services to the king of Prussia, for whom he had fought in the Seven Years' War; he was a Prussian field-marshal, and was at pains to make the regiment of which he was colonel a model one, and he was frequently engaged in diplomatic and other state affairs. He resembled his uncle, Frederick the Great, in many ways, but he lacked the supreme resolution of the king, and in civil as in military affairs was prone to excessive caution. As an enthusiastic adherent of the Germanic and anti-Austrian policy of Prussia he joined the *Fürstenbund*, in which, as he now had the reputation of being the best soldier of his time, he was the destined commander-in-chief of the federal army.

Between 1763 and 1787 his only military service had been in the brief War of the Bavarian Succession; in the latter year, however, the duke, as a Prussian field-marshal, led the army which invaded Holland. His success was rapid, complete and almost bloodless. Five years later he was appointed to the command of the allied Austrian and German army assembled to crush the French Revolution. He was so far in acknowledged sympathy with French hopes of reform that when he gave an asylum in his duchy to the "comte de Lille" (Louis XVIII.) the Revolutionary Government made no protest. Indeed, earlier in this year (1792) he had been offered supreme command of the French army. As the king of Prussia took the field with Brunswick's army, the duke felt bound as a soldier to treat his wishes as actual orders. (For the events of the Valmy campaign see FRENCH REVOLUTIONARY WARS.) The result of Brunswick's cautious advance on Paris was the cannonade of Valmy followed by the retreat of the allies. The following campaign of 1793 showed him perhaps at his best as a careful and exact general. But when Brunswick became unable to move or direct his army without interference from the king, he laid down his command and returned to govern his duchy. He did not, however, withdraw entirely from Prussian service, and in 1803 he carried out a successful and diplomatic mission to Russia. In 1806, at the personal request of Queen Louise of Prussia, he consented to command the Prussian army, but here again the presence of the king of Prussia and the conflicting views of numerous advisers of high rank proved fatal. At the battle of Auerstedt the old duke was mortally wounded. He died on Nov. 10, 1806, at Ottensen, near Hamburg.

His son and successor, FRIEDRICH WILHELM (1771-1815), who was one of the bitterest opponents of Napoleonic domination in Germany, took part in the war of 1809 at the head of a corps of partisans. He fled to England after the battle of Wagram, and returned to Brunswick in 1813, where he raised fresh troops. He was killed at the battle of Quatre Bras on June 16, 1815.

See Lord Fitzmaurice, *Charles W. F., duke of Brunswick* (1901); memoir in *Allgemeine deutsche Biographie*, vol. ii. (Leipzig, 1882); and A. Chuquet, *Les Guerres de la Révolution*, vol. i. (1887).

**BRUNSWICK**, a former duchy of northern Germany, proclaimed a republic on Nov. 8, 1918, as Freistaat Braunschweig. It comprises three larger and six smaller portions of territory. The principal or northern part, containing the towns of Brunswick, Wolfenbüttel and Helmstedt, is situated between the Prussian provinces of Hanover and Saxony. The western part, containing Holzminden and Gandersheim, extends eastward from the river Weser to Goslar. The Blankenburg, or eastern portion, lies south-east of the latter, between Anhalt and the Prussian province of Hanover. The six small enclaves, lying in the Prus-

sian provinces of Hanover and Saxony, are: Thedinghausen, Harzburg and Kalvörde, Bodenburg, Olsburg and Ostharingen. A portion of the Harz mountains was, down to 1874, common to Brunswick and Prussia (Hanover) and known as the Communion Harz. In 1874 a partition was effected, but the mines are still worked in common, four-sevenths of the revenues derived from them falling to Prussia and the remainder to Brunswick.

The northern portion of the Free State is mostly arable and has little forest. The other two principal portions are intersected by the Harz mountains, the higher parts of which are covered with forests of fir, oak and beech. Brunswick, though so scattered, belongs almost entirely to the basin of the river Weser. The area of the Free State is 1,424 sq.m.; about one-half is arable, while forests cover large areas. Pop. (1925) 501,875. Hildesheim is the seat of the Roman Catholic bishopric of North Germany, but the Free State is mainly Lutheran.

The land devoted to agriculture is excellently farmed, and cereals, beet (for sugar), potatoes and garden produce of all kinds, particularly fruit, obtain the best market prices. The pasture land rears fine horses, cattle and sheep. Timber cutting, in the forests of the Harz, employs a large number of hands. The mining industry, chiefly in the Harz, yields coal (bituminous), iron, lead, copper, sulphur, alum, marble, alabaster, lime, building-stone and salt; and by-products, particularly chemicals and asphalt, are important.

The manufactures include beet-sugar, concrete, preserves and sausages; jute-spinning and weaving are carried on.

### HISTORY

When, in 1181, Henry the Lion, the great duke of Saxony, was placed under the imperial ban and his duchy dismembered, he was allowed to retain his hereditary possessions, which consisted of a large part of Brunswick and Lüneburg. The bulk of these lands passed to Henry's grandson, Otto, and in 1235 the emperor Frederick II., anxious to be reconciled with the Welfs, recognized Otto's title and created him duke of Brunswick and Lüneburg. In 1252 Otto was succeeded by his sons Albert and John, who, in 1267 divided the duchy, Albert becoming duke of Brunswick, and John duke of Lüneburg. The Lüneburg line died out in 1369 and, after a long contest, the duchy was annexed to that of Brunswick-Wolfenbüttel (1388). In 1285 the duchy of Brunswick had been divided between Duke Albert's three sons, who founded the lines of Wolfenbüttel, Göttingen and Grubenhagen. The Wolfenbüttel branch died out in 1292, but was refounded in 1345 by Magnus I., (d. 1369) a younger member of the Göttingen family and ancestor of the later dukes of Brunswick. His grandsons, Frederick, Bernard and Henry, secured Lüneburg in 1388, but in 1428 Bernard, the only survivor, was forced to divide the duchy, he himself receiving Lüneburg, while his nephews, William and Henry, obtained Brunswick, which in 1432 they divided into Calenberg and Wolfenbüttel. In 1473, however, William, who had added Göttingen to his possessions in 1463, united these lands; but they were again divided from 1495 to 1584. In 1584 Brunswick was united by Duke Julius, and in 1596 Grubenhagen was added to it. Duke Frederick Ulrich, however, was obliged to cede this territory to Lüneburg in 1617, and when he died in 1634 his family became extinct, and Brunswick was divided between the two branches of the Lüneburg family.

The duchy of Lüneburg, founded by Bernard in 1428, was divided in 1520 between the three sons of Duke Henry. Two of the branches thus founded soon died out; and in 1569, after the death of Ernest I., the representative of the third branch, his two sons agreed upon a partition which is of considerable importance in the history of Brunswick, since it established the lines of Dannenberg and of Lüneburg-Celle, which divided the duchy of Brunswick-Wolfenbüttel in 1635. The dukes of Lüneburg-Celle subsequently took the name of Hanover, and were the ancestors of the later electors and kings of Hanover. After the acquisition of 1635 the family of Dannenberg took the title of Brunswick-Wolfenbüttel and ruled in the direct line until 1735. It was then followed by the family of Brunswick-Bevern, which had split off from the parent line in 1666, and ruled until 1884.

The constant partitions of its territories and the quarrels of its separate lines of princes prevented Brunswick from playing a great part in German politics. During the Thirty Years' War, indeed, Christian, bishop of Halberstadt, younger brother of Frederick Ulrich of Brunswick-Wolfenbüttel, a notable cavalry leader, distinguished himself as "one of the most brutal condottiere of the war and a foul-mouthed censor of would-be peace-makers," while the astute conduct of Duke George of Brunswick-Lüneburg made possible the future greatness of the House of Hanover. But after the peace of 1648 Brunswick began to be overshadowed by the power of Brandenburg. Of its later dukes the most famous was Charles William Ferdinand, who succeeded his father, Charles I., in 1780, and was held to be the greatest captain of his age (*see* BRUNSWICK, KARL WILHELM FERDINAND, DUKE OF). After 1806 Brunswick was included by Napoleon in the Kingdom of Westphalia, but in 1814 was restored to Duke Frederick William, who fell at Quatre Bras in 1815. During the minority of his son, Charles II., the duchy was ruled by George, Prince Regent of Great Britain, through Count Münster. On coming of age, Duke Charles made himself very unpopular and, during the revolutionary upheaval of 1830, was forced to leave the country for good. His brother William, who was formally proclaimed his successor in 1831, proved an able and popular ruler.

**The Brunswick Succession Question.**—After 1866 the question of the succession became acute. William was unmarried, and the next heir was the ex-King George of Hanover, whose territories had been annexed to Prussia. The attitude of Prussia being prohibitive, Duke William, with the consent of the Brunswick parliament, arranged in 1879 for a council of regency to take over the government on his death and, in the event of the heir being unable to succeed, to appoint a regent. On William's death (Oct. 18, 1884) Ernest, duke of Cumberland, son of George V. of Hanover, claimed the succession; but, since he had not formally renounced his claim to Hanover, the Federal Council declared that his accession would endanger the peace of the Empire, and the council of regency therefore ignored his claim and elected Prince Albert of Prussia regent. After his death, in 1906, the Brunswick diet elected Duke John Albert of Mecklenburg-Schwerin regent (May, 1907). The question was settled in 1913, when Prince Ernest Augustus of Cumberland, after renouncing his claim to Hanover, was recognized as Duke of Brunswick and married (May 24) to the Princess Victoria Louise, only daughter of the Emperor William II. After the revolution of 1919 the duchy became a separate state of the new republican Reich.

Köcher, *Geschichte von Hannover und Braunschweig 1648-1714* (Leipzig, 1884); O. von Heinemann, *Geschichte von Braunschweig und Hannover* (Gotha, 1884-92); H. Guthe, *Die Lande Braunschweig und Hannover* (Hanover, 1890).

**BRUNSWICK**, a city of Germany, capital of the republic and former duchy of that name (*Braunschweig*), situated in a fertile and undulating country, on the Oker, 53m. N.W. of Magdeburg, on the main railway from Berlin. Pop. (1925) 146,725. Brunswick is said to have been founded about 861 by Bruno, son of Duke Ludolf of Saxony, from whom it takes its name. Afterwards fortified and improved by Henry the Lion, it became one of the most important cities of northern Germany. For a long time its constitution was rather peculiar, as it consisted of five separate townlets, each with its own walls and gates, its own council and Rathaus. In the 13th century it ranked among the first cities of the Hanseatic League. It later declined in prosperity in consequence of the divisions of territory, the jealousy of the neighbouring States, the Thirty Years' War, and more recently the French occupation, under which it was assigned to the kingdom of Westphalia. During the Reformation the sympathies of the citizens were with the new teaching, and the city was a member of the League of Schmalkalder. In 1830 it was the scene of a violent revolution, which led to the removal of the reigning duke. It attained municipal self-government in 1834.

The fortifications, dismantled in 1797, have given place to a circle of gardens and promenades. Within them lies the old town,

with somewhat narrow and crooked streets, remarkable for its numerous ancient houses, with high gables and quaintly carved exteriors, as at Lübeck. The cathedral, St. Blasius, is Romanesque (1173-94). The chancel is decorated with 12th century frescoes by Johannes Gallicus, and contains the tombs of the founder, Henry the Lion, and his consort, and also that of the emperor Otto IV. In the vault beneath rest the remains of the Guelphs of the Brunswick line (since 1681). The Magnikirche was consecrated in 1031; the present edifice being built between the 13th and 15th centuries and restored in 1877. The Martinkirche was originally a Romanesque basilica (1180-90), enlarged in the 13th century in Gothic, and remarkable further for the splendid late Gothic Annenkapelle (1434) and three magnificent portals. The Katharinenkirche, with a fine tower, was begun by Henry the Lion in 1172, and finished in 1500. Of the 13th, 14th and 15th centuries are the Andreaskirche and the Aegidienkirche.

The town hall of Brunswick is a gem of Gothic architecture (14th and 15th centuries). In front stands a beautiful leaden fountain of the early 15th century. Near the cathedral are the cloth merchants' hall (*Gewandhaus*) of the 13th century, with a richly ornamented façade in Renaissance style, now occupied by the chamber of commerce and the restored Huneborstelsche Haus with its beautiful oak carving of the 16th century. The ducal palace is a fine modern structure, erected since 1865. The scientific and art collections of Brunswick are numerous. The educational institutions include the Collegium Carolinum, founded in 1745, the technical high school, with 1,000 students in 1925, and an academy of forestry. The industries of the town are very varied. Especially important are the manufacture of metal work and small machinery, boilers, gasometers, preserves, sugar, chocolate, chemicals, beer and sausages. Jute-spinning is also carried on and asparagus widely exported. Brunswick is a leading centre of the book trade.

**BRUNSWICK**, a city in south-eastern Georgia, U.S.A., on St. Simon sound, four m. from the ocean; a port of entry and the county seat of Glynn county. It is on Federal highways 17, 84 and 341, and is served by the Atlanta, Birmingham and Coast, the Atlantic Coast Line, and the Southern railways, and by coastwise and ocean-going steamers. The population in 1920 was 14,413, of whom 7,120 were negroes, and was 14,022 in 1930 by the Federal census.

It has an easily accessible landlocked harbour, with a controlling depth of 27 feet. The commerce of the port amounted in 1926 to 999,858 tons, valued at \$47,439,100, and included considerable exports of rosin and lumber. A fleet of over 200 boats is engaged in the fishing industry, which has an annual output (chiefly shrimp) valued at \$1,250,000. There is a large oil-refinery, supplied from the Texas and Mexican fields by its own tankers, a large creosoting plant, and important manufactures of naval stores, fertilizers, cross-ties, veneer, and other lumber products.

An equable climate and romantic sub-tropical scenery make Brunswick a delightful resort in both winter and summer. The city is connected with several islands off the coast by causeways, bridges, and trestles over the intervening marshes and streams. Jekyll island, just east of the city, is owned by a club. On St. Simons island, where Oglethorpe founded the town of Frederica and in 1742 defeated the Spaniards in the battle of Bloody Marsh, are remains of the fort he built in 1736 of "tabby" (a mixture of sand and oyster shells); ruins of the much older Spanish Mission; and the giant oak under which Charles Wesley sang and John Wesley preached. The beauties of the salt marshes east of the city are immortalized in Sidney Lanier's poems, especially "The Marshes of Glynn" and "Sunrise."

Brunswick was laid out by the council of the royal province of Georgia in 1771, and was named after the seat of the reigning House of Hanover. The city was incorporated in 1856.

**BRUNSWICK**, a village of Cumberland county, Maine, U.S.A., on the Androscoggin river and the Maine Central railroad, 20m. N. E. of Portland. The population in 1930 was 6,144. Abundant water-power from the river is utilized by paper, pulp and cotton mills. On a 40ac. campus at the head of the principal street is Bowdoin college, which was incorporated in 1794, while

Maine was still a part of Massachusetts, and was named after James Bowdoin, a distinguished governor of Massachusetts. The total number of resident students is limited to about 500, and high academic standards are maintained. Among the 7,252 graduates have been many men of prominence in American letters and public life, including Henry Wadsworth Longfellow, Nathaniel Hawthorne, Franklin Pierce, Melville W. Fuller, Oliver Otis Howard, Thomas B. Reed and Robert Edwin Peary. Brunswick was settled by fishermen in 1628, and was at first called Pejepscot. A township was established under the present name in 1717, and the village was incorporated in 1836.

**BRUNSWICK-BEVERN, AUGUST WILHELM**, DUKE OF (1715-1781), Prussian soldier, son of Ernst Ferdinand, duke of Brunswick-Bevern, entered the Prussian army in 1731. He commanded a wing in the battle of Lobositz in 1756, and defeated the Austrians under Marshal Königsegg at Reichenberg on April 21, 1757. He took part in the battles of Prague and Kolin and the retreat to Görlitz, and subsequently commanded the Prussians left behind by Frederick in the autumn of 1757 when he marched against the French. Bevern conducted a defensive campaign against overwhelming numbers with great skill, but he soon lost the valuable assistance of Gen. Winterfeld, who was killed in a skirmish at Moys; and he was eventually brought to battle and suffered a heavy defeat at Breslau on Nov. 22. He fell into the hands of the Austrians on the following morning, and remained prisoner for a year. On Aug. 11, 1762, he inflicted defeat at Reichenbach on an Austrian army endeavouring to relieve Schweidnitz. Bevern retired, after the Peace of Hubertusburg, to his government of Stettin, where he died in 1781.

**BRUNSWICK BLACK**, a very useful black varnish extensively used for painting stoves, grates, fenders, and all inside ironwork. It possesses excellent anti-corrosive and preservative properties, and thus effectively prevents the rusting of all metal surfaces on which it is applied, while at the same time imparting to them a highly lustrous black finish.

The process of manufacture consists in melting asphaltum in large iron pans set in brickwork over a fire. When the fusion is complete and the molten mass is in a thin fluid condition, the fires are withdrawn and sufficient turpentine or turpentine substitute is added to thin the mass to a consistency which renders it easily applicable.

A proportion of common rosin is frequently added to the asphaltum in order to increase the lustre of the Brunswick black, but if too much is added the denseness of the black is impaired. The best varieties of Brunswick black contain a proportion of boiled linseed oil which is incorporated with the asphaltum during the melting process and serves to toughen the black, and thus prevent it chipping or powdering off.

The following are two representative formulae for the manufacture of Brunswick black:—

| (1)        |        | (2)                |        |
|------------|--------|--------------------|--------|
| Asphaltum  | 112lb. | Gilsonite          | 112lb. |
| Dark Rosin | 50lb.  | Boiled Linseed Oil | 2gal.  |
| Turpentine | 22gal. | Turpentine         | 25gal. |

Brunswick black dries in about 2-3 hours. It is only suitable for inside use and should not be used on exterior work, as owing to its composition it lacks durability and if exposed to weathering influences would rapidly deteriorate and powder off. In painting exterior ironwork only black varnishes specially manufactured for outside use should be used.

**BRUNTON, MARY** (1778-1818), Scottish novelist, was born Nov. 1 1778, in the island of Barra, Orkney, and died at Edinburgh Dec. 10 1818. She was the daughter of Capt. Thomas Balfour of Elwick. At the age of 20 she married Alexander Brunton, minister of Bolton in Haddingtonshire and afterwards professor of oriental languages at Edinburgh. She was the author of two novels, popular in their day, *Self-control* (1810) and *Discipline* (1814; 1832 edition with memoir); and of a posthumous fragment, *Emmeline* (1819).

**BRUNTON, SIR THOMAS LAUDER** (1844-1916), Scottish physician, was born at Hiltonhill, Roxburghshire, on March 14, 1844. He was educated at Edinburgh university, and after three years of medical work in continental cities, was

appointed in 1870 as lecturer in materia medica and pharmacology at Middlesex hospital, London. In 1871 he went in the same capacity to St. Bartholomew's hospital where, three years later, he became assistant physician and in 1895 physician, a post which he resigned in 1904. He was knighted in 1900, and in 1908 was created a baronet. Brunton specialized in the problems of circulation, his papers on his early work on the use of digitalis, nitrates, enzymes, etc., being included in *Collected Papers on Circulation and Respiration* (1906). His chief works include *Text-book of Pharmacology* (1885); *An Introduction to Modern Therapeutics* (being the Croonian lectures for 1889); *Lectures on the Action of Medicines* (1897); *Collected Papers on Physical and Military Training* (1898-1915), and *Disorders of Assimilation, Digestion, etc.* (1901).

**BRUSA** or **BROUSSA**, the capital of the Brusa (Khudavendikar) vilayet of Turkey. The city stretches along the lower slopes of the Mysian Olympus or Kechish Dag, occupying a position above the valley of the Nilufer (Odrysses) not unlike that of Great Malvern above the vale of the Severn. It is divided by ravines into three quarters, and in the centre, on a bold terrace of rock, stood the ancient *Prusa*. The modern town has clean streets and good roads made by Ahmed Vefyk Pasha when Vali, and it contains mosques and tombs of great historic and architectural interest; the more important are those of the sultans Murad I., Bayezid (Bajazet) I., Mohammed I., and Murad II. (1403-1451), and the Ulu Jami'. The mosques show traces of Byzantine, Persian and Arab influence in their plan, architecture and decorative details. The circular church of St. Elias, in which the first two sultans, Osman and Orkhan, were buried, was destroyed by fire and earthquake, and rebuilt by Ahmed Vefyk Pasha. Silk-spinning is an important industry, and there are also manufactories of silk stuffs, towels, carpets, burnús, and felt prayer-carpets embroidered in silk and gold. The hot iron and sulphur springs near Brusa, varying in temperature from 112° to 178° F, are still much used. The town is connected with its port, Mudania, by a railway and a road. Pop. (1927) 127,139.

But for the comparative proximity to the sea this ancient and beautiful city would probably have become the capital of the new Turkish republic. During the Greco-Turkish conflict (1919-22) Brusa and neighbourhood was the scene of severe fighting. In April 1920 the sultan's force under Anzavur Bey, when advancing on Brusa, was defeated by the Nationalists, who in their turn were defeated and driven out of the city in August by the northern army of the advancing Greeks. When the final rout of their main forces took place, in 1922, the Greeks offered a stubborn resistance at Brusa, and did not finally withdraw until Sept. 12. Before this retirement a commission of Allied officers arrived to prevent any wanton damage being done to the architectural masterpieces in the city.

*Prusa*, founded, it is said, at the suggestion of Hannibal, was for a long time the seat of the Bithynian kings. It continued to flourish under the Roman and Byzantine emperors till the 10th century, when it was captured and destroyed by Saif-addaula of Aleppo. Restored by the Byzantines, it was again taken in 1327 by the Ottomans after a siege of ten years, and continued to be their capital till Murad I. removed to Adrianople. In 1402 it was pillaged by the Tatars; in 1413 it resisted an attack of the Karamanians; in 1512 it fell into the power of Ala ed-Din; and in 1607 it was burnt by the rebellious Kalenderoglu. In 1883 it was occupied by the Egyptians under Ibrahim Pasha, and from 1852-1855 afforded an asylum to Abd-el-Kader.

See L. de Laborde, *Voyage de l'Asie Mineure* (1838); and C. Texier, *Asie Mineure* (1839).

**BRUSASORCI** (DOMENICO DEL RICCIO) (c. 1516-1567), Italian painter of the Veronese school, pupil of Giovanni Francesco Caroto. He was a colourist, according to Berenson, "the first purely pictorial artist in Italy." His importance in art history is mainly due to his being the predecessor of Paolo Veronese. There are pictures by him which resemble those of his great follower, both in design and colour; among these are the altarpieces in the churches of S. Eufemia and San Lorenzo, and some single, well-preserved figures in his frescoes in the archbishop's palace at

Verona. His principal works are in Verona; there are very few elsewhere. In 1551 he painted frescoes on the façade of the Casa Garavaglia in Via San Marco at Trent, representing Midas and Apollo, and a battle with Norsemen. His altarpiece at Mantua cathedral is dated 1552. There is a picture of the Last Supper in the collection of Henry White Cannon at the Villa Doccia, Fiesole.

**BIBLIOGRAPHY.**—Vasari Milanese, *Vite*; C. Ridolfi, *Le Maraviglie dell'Arte* (1648); B. Berenson, *North Italian Painters* (1907); L. Simeoni, *Verona* (1909); J. P. Richter, *A Descriptive Catalogue of Old Masters of Italian School in the Villa Doccia* (1907).

**BRUSH, CHARLES FRANCIS** (1849-1929), American physicist, inventor and manufacturer, was born in Euclid, O., on March 17, 1849. He graduated in mining engineering at the University of Michigan in 1869, and from 1870 to 1873 he practised as an analytical chemist in Cleveland, O. For the next four years he was a commission merchant, dealing in iron and ores. In 1878, after successful experimentation with electric lighting, he produced the electric arc light which bears his name. This was the outstanding achievement of his earlier life as an inventor. In 1880 he founded the Brush Electric Company which became the owner of his numerous patents in the field of electric lighting. The American Academy of Arts and Sciences awarded him the Rumford medal in 1899 for "the practical development of electric arc lighting" and in 1913 the Institute of Electrical Engineers conferred upon him the Edison medal. In addition to his research in electricity, he gave much study to gravitation and molecular physics. He died at Cleveland, O., on June 15, 1929.

**BRUSH, GEORGE DE FOREST** (1855- ), American painter, was born at Shelbyville (Tenn.), on Sept. 28, 1855. He was a pupil of J. L. Gérôme at Paris, and became a member of the National Academy of Design, New York, and of the American Academy of Arts and Letters. From 1883 onwards, he attracted much attention by his paintings of North American Indians, his "Moose Hunt," "Aztec King" and "Mourning her Brave" achieving great popularity and showing the strong influence of Gérôme. These were followed by picture portraits, particularly of mother and child, largely suggestive of the work of the Dutch, Flemish and German masters, carefully arranged as to line and mass, and worked out in great detail with consummate technical skill. Several of his paintings have for subject his own children and his wife; one of these is in the Boston Museum of Fine Arts. His "In a Garden" is in the Metropolitan Museum, New York city, "Mothers and Children" in the Pennsylvania Academy, Philadelphia, and "Mother and Child" in the Corcoran Art Gallery, Washington (D.C.). He has received gold medals from the Pennsylvania Academy of Fine Arts, 1897, and the Paris Exposition, 1900.

**BRUSH**, an instrument used for removing dust or dirt from surfaces; also for applying paint, distemper, etc. The derivation is from O.Fr. *broce*, brushwood; Fr. *brosse*. One of the first types of known brushes is the besom, a bundle of twigs or brushwood tied to a wooden handle by means of cane. A broom may be said to be a brush with a long handle.

BY COURTESY OF FULLER BRUSH COMPANY  
THREE MODERN TYPES OF BRUSHES

The range of materials available for brushmaking is now very great, as the hair from tails of many animals and the fibrous materials derived from many varieties of vegetable growth are now called into use by the manufacturer. The more important materials employed are the hairs of the pig, boar, horse, badger, goat, bear, skunk, ox; the fur of the sable, marten, squirrel, etc., and vegetable products such as piassava (bass), palmyra fibre, bassine, kitool, Mexican fibre, whisk, coco and cane; whalebone,

including the hairy or bone-like substance forming the mesh for catching fish in the mouth of the whale known as "finner," and also the fibrous parts of whale fins.

Amongst the woods used for the handles or stocks of brushes and brooms are oak, satinwood, rosewood, ebony, sycamore, sabacu, beech, walnut, cherry, elm, chestnut, alder, lime, kauri pine and mahogany. Other materials used for stocks of brushes are ivory, tortoiseshell, celluloid, erinoid and bone.

The hairs of the hog, pig and boar, are known as "bristles." The most suitable bristles come from the northern parts of Europe and Asia; the greater proportion is imported into Great Britain from Russia, China and India. The chief sorts of horse-hair are English and those imported from Australia, South America, Siberia and China.

Among the fibres are piassava, obtained from the leaf-stalk and trunk of the palm *Attalea Fumifera* which grows in the Brazilian forests, and also from leaf-stalks of the African palm. Both Bahia and African piassava are known as bass, the latter being a much stiffer and coarser fibre than Bahia piassava. Another Brazilian fibre known as Para but more commonly as monkey bass, is used for drawn work, while Bahia piassava is often used for set work. There are several sorts of Mexican fibre (locally known as Istle) and obtained from *Bromelia Sylvestris*, the best known probably being Jaumave and Tula, the latter providing a shorter and stiffer fibre than the former. Kitool is obtained from the Indian palm *Caryota Urens*; and bassine (also an Indian product) from the Palmyra palm (*Borassus*). *Flabelliformis*. Whisk is obtained from Mexico, France and Italy.

**Brush Manufacture.**—The various methods of manufacture are here described, and one or more of them apply to each type of brooms and brushes.

(a) **Pan Setting.**—In the case of set brushes, the material is made into knots of the required size, dipped into boiling pitch, then bound by means of a thrum, again dipped into boiling pitch and then inserted into the stock, which has been previously bored either by hand or by machine.

(b) **Machine Filling.**—Machines are now playing a large part in the manufacture of brushes, and are gradually replacing hand drawing and pan setting. By means of machines the knots are punched into the solid backs and are secured by a staple at the same operation.

(c) **Hand Drawing.**—In the case of hand-drawn brushes, the knots are drawn into the holes from the back of the brush with wire. When all the holes of the brush are filled, the brush is completed by means of a veneer which is glued or screwed on the back and then finished by the brush finisher; afterwards the bristles or other materials are levelled by means of shears and the brush is ready for use.

Another method of hand-drawing is known as trepanned work. The holes are bored only to a certain depth and connected at the bottom with a long hole running the length of the brush stock. In the latter hole, the thread with which the brush is drawn is placed and secured at one end, and the thread is drawn out of the hole in a loop and the knot is placed in the loop and drawn in from the end of the brush. This is the only method which can be used for hand-drawn ivory brushes and at one time was also used for ebony brushes, although the latter are now also machine filled.

(d) **In Twisted Wire.**—The bristle or other material is secured by means of the wire of the handle of the brush being twisted as with the common flue brush. In some cases, the ends of the twisted wire are inserted into a handle of wood.

**Types of Brooms and Brushes.**—The following are the various types of brooms and brushes manufactured in Great Britain.

(1) **Household Brooms and Brushes.**—These consist of sweeping brooms, carpet brooms, yard brooms, scrubbing brushes, stove brushes, hearth brushes, boot brushes, etc. The methods of manufacture are pan setting, machine filling, hand drawing and in twisted wire. The materials used are bristle, hair, whisk, bass, fibre, kitool, coco, cane.

(2) **Toilet Brushes.**—(a) **Toothbrushes:** hand drawing is chiefly used in the case of bone handled toothbrushes. Machine filling is almost exclusively used in the case of celluloid handled brushes. These brushes are chiefly made of white bristle, the handle being of bone or celluloid. Bone handles are made from the thigh bones of the ox, and after being shaped, are bored with small holes and filled with bristles.

(b) **Other Sorts.**—In this section may be included hair brushes, clothes brushes, hat brushes, shaving brushes, etc. These are manufactured by pan setting, machine filling, hand drawing, and in twisted wire. The materials used consist of wooden stocks and twisted wire handles for clothes and hat brushes and other brushes of this type. Wood, ivory, tortoiseshell and erinoid are used for hair brushes; bone, horn or composition handles and wooden stocks with metal ferrules for shaving brushes. Shaving brushes are also made like string bound sash tools, the only difference being in the handle, which is very much shorter. Badger or bristle is used mostly for shaving brushes; for the other types of brushes, bristle, horse-hair, and in the cheaper kinds, either fibre alone or a mixture containing fibre.

(3) **Painters' and Decorators' Brushes.** (See Brushes, Art, below.)—Nearly all patterns of painting brushes are composed of three parts, the bristles or similar materials, ferrules—or other binding—and handles. In this class are sash tools, distemper and paint brushes, stock brushes, varnish brushes, etc. They may be either hand or machine-made.

(4) **Artists' Brushes.** (See below, and AIRBRUSH.)

(5) **Wire Brushes.**—These include bottle cleaning brushes, chimney sweeping or flue brushes, brushes for cleaning butchers' blocks and the steel surfaces of boilers. These may be hand-drawn, machine-made or in twisted wire.

Different kinds of wood are used for the stocks, wire for the twisted wire handles and also different gauges of wire for filling the wooden handles or stocks. Brushes with twisted wire handles are made with bristles, hair or fibre or a mixture of these materials.

(6) **Other Kinds of Brushes.**—Amongst the numerous other kinds of brushes are those made for special industries and those made for special machinery known as machine brushes. Jewellers also have special brushes for cleaning silver, etc., and the pastrycook also uses a tool known as a pastry brush.

**Employment, Output, etc.**—It is estimated that there are 12,000 employees in the British brush industry, of whom nearly half are females.

The consumption of brushes and brooms in Great Britain is estimated at approximately 8,000,000 dozens based on figures supplied by 1924 census of production.

|   | Dozen      |

## ART BRUSHES

**History.**—The brush, like many other hand tools, is simply an improvement on what the fingers can do. No attempt will be made to trace its exact origin, but among the remains of the Cro-Magnon race are found pictures on the walls of Dordogne that certainly required brushes in painting them. As civilization advanced and wider uses were found, the crude brush, made possibly with reeds, was supplanted by a bunch of bristles tied to a stick; from then the brush developed rapidly. From the proficiency of the Egyptians and Greeks, we know very little basic improvement has been made in the paint brush since 3000-2000 B.C. A greater variety of uses in the art of painting, as well as specialization in industry, has brought about every conceivable form of the brush, every kind of hair and setting, as might be expected when one considers that its use varies from that of painting miniatures to washing railroad cars.

**Material.**—In selecting the hair or bristle for a brush, the manufacturer uses that of many different animals and depends upon various countries to furnish such material. The most popularly used type of bristles for the stiffer paint and art brushes are the French bristles. These are pulled from hogs of central Europe, are white, range from 1½ in. to 4 in. in length, and form one of the best known types of the bristle brush. Russia also furnishes bristles, which are longer and heavier, and greyish in colour. The most plentiful of all, however, are the black bristles of China, which are divided into two groups: those coming from the northern part of China, and called Tientsin bristles; those coming from the southern part of China, and called Hankow bristles. Naturally in a cold climate, such as that of northern China, animals grow longer and finer coats, while the bristles of the animals of the warmer climate are found to be shorter and stiffer. The Tientsin bristles are used largely for varnishing brushes, and the Hankow bristles for paint brushes, a stiff bristle being needed to push a heavy pigment along.

Besides bristle, other varieties of hair are used. Red sable is perhaps the most sought after. Sable is cut from the tail of the kolinsky, an animal whose habitat is Siberia and Russia. The pelts are used in fur coats. The hair is reddish yellow, does not exceed 1½ in. in length, and is noted for its remarkable springiness and fineness. It is employed mostly in the manufacture of fine water colour and oil colour brushes. Camel-hair is very important because of its wide use. The term is a misnomer, however, the commercial material that is generally known as camel's hair being taken from a species of squirrel that is also an inhabitant of cold countries like Siberia and Russia. The best grade of camel-hair comes from the Province of Kazan in Russia; it is the softest of all the hairs employed in brush making. Its extreme length runs to about 3 in. and in colour it ranges through red, blue, grey and black.

Badger hair is a popular type, used in fine finishing and varnishing brushes. It comes from the animal of that name, and has the distinction of being the only hair taken from the pelt of animals; all others are taken from the tails. It is greyish in colour, with a black band about ½ in. from the tip.

Fitch hair is similar to badger and meets similar uses. It is brownish black, has considerable gloss, and is taken from a skunk.

Amongst the hairs that are not so popular are the Russian sable, similar in length and quality to red sable, but dark grey in colour; bear hair, which looks very much like fitch; and black sable, which resembles fitch but is taken from a South American civet. Several types of Chinese brushes are made of goat hair, but this material has not invaded Europe or the United States to any extent up to the present time.

**Manufacturing.**—In manufacturing paint brushes of hair, the brush-maker generally considers that the tanning of the skin is enough preparation. Bristle is treated quite differently. Chinese bristles are shipped to England and America, cased and sorted according to their native province only. The brush-maker must remove these, and sterilize and sort them before they can be utilized in making brushes.

Every bristle or hair, with the exception of some that are adulterants in brush-making (like horsehair) has a flag end and a butt end. The flag is the tip that has grown out of the animal; the butt is the root. A bristle is similar to an elongated cone in shape, and the brush-makers test adulterations of horsehair by rolling a bristle between the thumb and forefinger; if it is genuine bristle, it will slowly roll out of the fingers at the flag end. Each bristle has a natural curve, and to remove this two bundles of bristles are bound end to end and tied with cord. They are then boiled for three hours, which action also sterilizes them. Copper screens are used with meshes of varying thicknesses to sort out the thick and thin bristles. The long and short ones are then sorted, the long ones being much more valuable than the short, after which the bristles are ready to be set.

**Settings.**—For every kind of brush, a slightly different process is used for setting. The leather-bound, metal-bound, cord and wire-bound, and wire-drawn brushes are the most common, and there are those set in rubber, cement, glue and pitch. Each has its

purpose. The popular type of floor-sweeper and dust brush is an example of a pitch-set brush, the setting being a great timesaver for the brush-maker, and just as good for the purpose as a rubber setting would be. Brushes used in water, as calcimine brushes, and water colour brushes for art purposes, are quite often set in cement, as rubber settings expand when wet and are liable to burst the metal ferrule surrounding the setting. Glue set brushes, while generally considered a cheap type of setting, are as serviceable where the brush is not to be used in water or anything that would dissolve the glue. Some of the finest colour brushes used in painting automobile bodies are glue set.

**Process.**—In making the average varnish brush, the brush-maker proceeds as follows: He takes up a handful of loose bristle and lays it on a scale, removing or adding bristles until it meets the proper weight. This bristle is then picked up and rolled out with both hands, the rolling being done by the thumbs with the finger tips held together. To straighten the bristle, it is constantly passed through a metal comb fastened upright on his bench. After a few seconds of rolling and combing, his adept fingers have made all the flag ends point upward, the convex side of the bristle lying on his palms and fingers. With a quick movement the portion in the right and left hands are folded on one another, so that all the flag ends point inward. This end of the bristle is then inserted in a brass cup which has just the shape on the inside that the brush will have on the outside when finished. The bottom of this cup is V-shaped, the V being covered with emery cloth. This aids the bristle in standing up straight. The thumbs and forefingers are then used in shaping the butt end, while the lower end of the cup is pounded vigorously on the bench, to make the bristles range along the emery cloth in a two-sided chisel shape.

All brushes of any quality are cupped in this manner and not cut, as is the popular idea. This cupping preserves the flag or soft end of the bristle which does the most work in painting. The brush-maker now clips the butt end that is sticking out of the cup until it is level or even. When two or three turns are taken with a fine piece of thread around the bristles, they are released from the cup into the metal ferrule, which will be their final resting place.

The glue, pitch, cement or whatever "set" is used, is poured in the ferrule in the space where the handle will go and allowed to settle down through the bristle and dry. If the brush is to be rubber set, the ferrule is pulled up, exposing the butt end of the brush about three-quarters of an inch. The brushes are then stood on the butt end in a tray with a perforated bottom. This tray is laid in another tray which contains pure gum rubber in solution with benzol. This submersion in the rubber is timed with great accuracy and the specific gravity of the rubber watched carefully, as capillary attraction is depended upon to raise the rubber up the bristle. If the bristles are left too long in the solution, the rubber will creep too far up and stiffen it against correct use.

The brushes are now removed from the gum, allowed to dry, and then laid in trays containing sulphur powder, whence they go to vulcanizing ovens. Vulcanization takes longer with brushes than with any other article because a heat great enough to vulcanize rapidly would injure the bristle. When the brushes are removed from the ovens, nothing remains but to pull the ferrule down in place and fasten the handles on. They are then put in a centrifugal machine which holds them by the handles and swings the bristle end around. This removes loose bristles, which were too short to catch in the vulcanizer.

Brushes of hair are shaped and cupped in a manner similar to those of bristle, with the exception of some very small art brushes that are shaped almost entirely with the fingers and lips. Art brushes require more rigorous rules as to the length and shape of the setting. There are one-stroke brushes, so named because their long stock and squared end permit a letterer to make Roman, Old English and script letters with one stroke. Designers, show card, letterers and retouchers are the names of some other typical art brushes.

Brushes set for water colour are generally fuller and longer than those set for oil, having a light liquid to deal with and the other a heavy pigment and oil. The metals in which art brushes are set must also be taken into consideration. Copper, because of its

non-corrosive quality is favoured for water colour, as is albata (an alloy of copper and nickel), while oil colour brushes need no such favouring.

Through France and central Europe, the setting of brushes in quills has prevailed for years. This industry is handed down from father to son, and bids fair to remain in France because of the availability of the quills.

In some of the larger types of brushes, and particularly in leather-bound brushes, a wedge is set in the centre of the bristle.

1. ROUND AND FLAT FRESCO PAINTING BRUSHES; 2. WATER COLOUR BRUSH; 3. QUILL STRIPER; 4. SWORD STRIPER; 5. OIL PAINTING BRUSH; 6. STENCIL BRUSH; 7. THREE STYLES OF QUILL BRUSHES; 8. BADGER BLENDER; 9. RIGGER

This leaves a V-shaped space between the two sides of the brush that has a tendency to hold more paint and prevent so much dipping of the brush. The longer stocks are much sought after in bristle buying, an added inch in length sometimes meaning twice the price. A long stock brush wears down to the length of a cheap brush through use.

**Types.**—The illustrations show some specialized brushes. Fig. 1 shows a round and flat fresco painting brush. As these are used in water colour and sometimes on ceilings the stock is extra long to give a light touch, hold plenty of the thin liquid and prevent dripping. Fig. 2 is a typical water colour brush. It assumes this shape only when it is wet. Two types of liners or stripers are shown in figs. 3 and 4. Fig. 3 is a quill striper and fig. 4 a sword striper. The entire length of the hair in these brushes used in coach striping is laid flat to take up any tendency to wobble and leave a jagged line. Fig. 5 is a "brights" brush used in oil painting and set to make short crisp strokes. Fig. 6 is a stencil brush, while fig. 7 shows different styles of quill brushes. Fig. 8 is a badger blender for softening harsh lines in a painting and for graining and marblizing. Fig. 9 is a squared-end lettering brush called a rigger.

(B. CH.)

**BRUSILOV, ALEXEI ALEXEIEVICH** (1853-1926), Russian soldier, was born Aug. 19 1853, of an old family. He began his military career as a cavalry officer in the Caucasus, and in the Russo-Turkish War of 1877-78 he distinguished himself by his courage and resource. From this time onwards he held important commands, and on the outbreak of the World War took command of the VIII. Army, which participated in the invasion of Galicia from the east. By Sept. 1915, after varying fortunes, his army had secured possession of Rovno, and was in temporary occupation of Lutsk. In April 1916 Brusilov succeeded Ivanov as commander of the Russian armies (VII., VIII., IX., XI.) south of the Pripet Marshes. A great offensive was launched during the summer of 1916 which brought much-needed relief to

the Italian armies by compelling the withdrawal of considerable enemy forces to face the crisis of Lutsk, but, owing to the lack of artillery munitions, this relief involved heavy Russian losses.

After the Lvov Coalition cabinet was formed in May 1917, Brusilov was given supreme command of the Russian armies, which, however, he did not long retain. During the fighting in Moscow in November, he was wounded by a chance bullet, though not himself actively engaged. He died in Moscow, March 17, 1926.

**BRUSILOV OFFENSIVE, THE:** see LUCK, BATTLES OF. **BRUSSELS**, the capital of the kingdom of Belgium (Fr. *Bruxelles*, Flem. *Brussel*) and of the province of Brabant, in a central position about 70m. from the North sea at Ostend. It occupies the valley of the Senne, a small tributary of the Schelde, and the surrounding hills on the east, south-east and west. The earliest inhabited site in the area is thought to have been what is now the eastern suburb of Anderlecht, a favourable natural clearing in the primitive forest. Foundations of an important Roman villa and Frankish cemeteries have been discovered; and the columns of the villa seem to have been utilized in constructing the crypt of the old church, St. Guidon, at Anderlecht. The Gallo-Roman population, dispersed by the Franks, sought refuge in the islands among the vast marshes of the Senne, and the Franks

HÔTEL DE VILLE, THE CITY HALL OF BRUSSELS, ONE OF THE MOST BEAUTIFUL BUILDINGS IN EUROPE

The building continues, after more than four centuries, to be the centre of civic administration and the official headquarters of the Burgomaster

themselves later followed them. Brussels, *Bruocsella*, *Broekzels*, "the village of the marsh," thus took its origin. In the 6th-7th centuries the evangelization of the region began, and Saint Gery founded an oratory in the main island, thenceforth known as "Ile Saint Gery." The name St. Gery occurs in the centre of the old town to-day, and reminds one of its early history.

At the fall of Charlemagne's empire, the small isles of the Senne were fortified and alongside the chapel a walled enclosure was built. In the 10th century, after the Norman incursions, there came comparative security and prosperity. Commerce and industry

developed side by side with the establishment of the merchant road linking Cologne, the Rhine metropolis, with the Flemish towns of Ghent and Bruges; and especially in those spots where it crossed north-flowing rivers, colonies of merchants and artisans grew up. The road crossed the Senne by Ile St. Géry and the adjacent islands and then climbed towards the Brabançon plateau on the right bank of the stream. Its course was marked by the

"LA MAISON DU ROI" OR BROODHUIS, BRUSSELS, COMPLETED IN 1877 Facing the Hôtel de Ville in the Grande Place, it stands on the site of the house where Egmont and Horn, regarded as martyrs of Flemish freedom, spent their last night before execution in 1568

old street called "Montagne de la Cour" now the Mont des Arts. The merchants of the new industrial town, free from the authority of an overlord, created a market, the origin of the *grande place*, and a house, the forerunner of the *hôtel de ville*, where they met. While the commercial town flourished and gradually formed the nucleus of the "low town" which is still the business quarter of Brussels, Henry I., duke of Brabant and count of Louvain, built a residence and, about the year 1200, the abbey of Saint Jacques on the Caudenberg, on the eastern edge of the plateau bordering the Senne valley. This was the beginning of the ducal agglomeration and of the "high town," still the aristocratic quarter with the king's palace.

In the first half of the 13th century new ramparts, including eight gates and 24 towers, were constructed to protect the industrial city. In 1312, Duke John II. of Brabant granted the citizens their charter, distinguished from others as that of Cortenberg. This charter, with the Golden Bull of the emperor, Charles II. (1349), was confirmed by the famous "Joyous Entry" of Duke Wenceslas into Louvain (1356). This established the early constitution of the South Netherlands, which remained almost intact till the Brabant Revolution in the reign of Joseph II. The 13th-century wall was soon outgrown, and in 1357 Duke Wenceslas ordered a new wall to be built, enclosing a much greater area. The modern boulevards follow its course. It included 74 towers and eight gates, and survived until 1830. In 1383 the dukes of Brabant

transferred their capital from Louvain to Brussels, although residing for some time in their castle at Vilvorde, half-way between the two turbulent cities. Brussels is supposed to have then had 50,000 people, one-fifth the number of Ghent. In 1420 a further charter was granted recognizing the gilds of Brussels as the Nine Nations, a division still existing. The dukes of Brabant built a castle and place of residence on the Caudenberg, and this eventually became the famous palace of the Netherlands whence Charles V. abdicated in 1555. In 1430 the duchy was merged in the possessions of the duke of Burgundy.

Seventeenth-century Brussels was described as "one of the finest, largest and best-situated cities of Europe." It suffered severely, however, from the bombardment of the French under Villeroi (1695). Sixteen churches and 4,000 houses were burnt down, and the historic buildings on the *Grande Place* were seriously injured, the houses of the Nine Nations on the eastern side being completely destroyed. In 1731 the famous palace of the Netherlands was practically destroyed by fire, some ruined arches and walls alone remaining.

**Buildings.**—The church of Ste. Gudule, also dedicated to St. Michael, is built on the side of the hill originally called St. Michael's Mount. Begun about 1220 and completed save for the two towers, in 1273, it is considered to be one of the finest specimens of pointed Gothic. The stained glass of the 13th–15th centuries is very rich. In many of the windows there are figures of leading members of the houses of Burgundy and Habsburg. The curious oak pulpit came originally from the Jesuit church at Louvain, and is considered the masterpiece of Verbruggen. The church of the Sablon is said to have been founded in 1304 by the gild of crossbowmen to celebrate the battle of Woeringen. In a side chapel is a fine monument to the princely family of Thurn and Taxis, which had the monopoly of the postal service in the old empire. La Chapelle is 13th century, but much restored.

The *Grande Place* is by its associations one of the most interesting public squares in Europe, and contains two of the finest and most ornate buildings in Belgium. The *Hôtel de Ville* occupies the greater part of the south side of the square. The older half of the façade dates from 1410, while the shorter and less ornate portion was begun in 1443. The fine tower, 360ft. in height, is crowned by a golden copper figure of St. Michael, 16ft. in height, erected as early as 1454. Opposite the town hall is the smaller but extremely ornate *Maison du Roi*, in which the royal address was read to the States General. It was almost entirely rebuilt after Villeroi's bombardment. The principal buildings of the 18th century are the king's palace and the house of parliament or *Palais de la Nation*. The palace occupies part of the site covered by the old palace burnt down in 1731. It was built in the reign of the empress, Maria Theresa, but has been greatly altered and enlarged since. The *Palais de la Nation* was constructed between 1779 and 1783. During the French occupation the law courts sat there, and from 1817 to 1830 it was assigned for the sittings of the States General. It is now divided between the senate and the chamber of representatives.

The improvements effected in Brussels during the 19th century completely transformed the city. The removal of the old wall was followed by the creation of the *quartiers Léopold* and *Louise* in the upper town. In the lower, the Senne was bricked in, and the fine *boulevards du Nord*, *Anspach*, *Hainaut* and *Midi* took the place of slums. The Bourse and the post office are two fine modern buildings in this quarter of the city. The Column of the Congress (*i.e.*, of the Belgian representatives who founded the kingdom of Belgium) surmounted by a statue of King Leopold I., was erected in 1859. The *Palais de Justice* was erected between 1866 and 1883, from the design of Poelaert, in the style of Karnak and Nineveh, but surmounted with a dome. (*See ARCHITECTURE.*) It is conspicuously placed on the brow of the hill at the southern extremity of the *rue de la Régence*, which contains the new picture gallery with an excellent collection of pictures, the palace of the count of Flanders, and the garden of the *Petit Sablon*. Immediately above this garden is the *Palais d'Arenberg*, one of the Renaissance *hôtels* (showing Spanish influence), which was, in the 16th century, the residence of Count Egmont.

In the early years of the 20th century new and spacious avenues were driven into the suburban woods, and below the *Place Royale* the old tortuous street called the "Montagne de la Cour" gave place to a *Mont des Arts*. The ridge on the west and north-west of the Senne valley, from which Villeroy bombarded the city, is built over from south to north by the suburbs of Anderlecht, Molenbeek and Koekelberg, while Laeken with its royal château

THE CHURCH OF ST. GUDULE IN BRUSSELS, BUILT ON THE SITE OF THE ORIGINAL ST. MICHAEL'S MOUNT

This Gothic structure was begun about A.D. 1220, but its towers were not added until the 14th or 15th century. It has rich stained glass windows of the 13th and 15th centuries

and park forms the northern part of the Brussels conglomeration. The communes of Laeken, Haeren and Neder Overheembeek, with parts of Molenbeek and Schaerbeek were incorporated in the city by a law of April 2, 1921, in order to facilitate the construction of the new outer port.

**The University.**—In 1788 the faculties of law, medicine and philosophy were removed from Louvain to Brussels, which in 1834 was constituted a free and independent university with the addition of a faculty of natural science. The university includes (1928) a school of political and social science, a school of commerce and an educational section. The library of the university is expanding and by the institution of chairs in special subjects, such as Flemish history and literature, colonial jurisprudence and international law, the intimacy of theoretical discipline and practical economic and political conditions is admirably maintained.

Although mainly a court city and a residential centre, Brussels has numerous industries among which the manufactures of

lace, carpets, curtains and furniture stand out. It is also an educational centre: the university had 1,640 students in 1925-26, while the *école militaire* trains students for the professions as well as for the army. The period since 1910 has seen many transformations in Brussels. The German occupation of the capital extended from Aug. 1914 to Nov. 1918. Gen. Sixt von Armin's troops entered on Aug. 20, and on Sept. 2 F.M. von der Goltz was appointed governor-general of Belgium. He was succeeded by Gen. von Bissing in 1915. Numerous social relief movements were instituted; among them the *Comité National de Secours* had its headquarters at Brussels, and with American aid organized the feeding of the Belgian population. The executions of Philippe Baucq and of Edith Cavell took place here. The Belgian army reoccupied Brussels on Nov. 18, 1918, and the king and queen re-entered the city in state on Nov. 22. Many old quarters of the "low town" have been demolished, and new arterial roads constructed. The palace of the count of Flanders became the *Banque de Bruxelles*, and in Nov. 1918 the city acquired the palace of the duke of Arenberg and gave it again its old name of *Palais d'Egmont*. The British monument commemorating the brotherhood of the two nations during the World War of 1914-18 was unveiled in 1923; it is a replica of the Belgian monument on the Victoria Embankment, London.

The foundation stone of new buildings for the university was laid in Nov. 1924 by Prince Leopold. A large sum was provided towards these by the American relief commission.

In 1920 a commercial fair was inaugurated; in 1925, 27 nations were represented, and the area of the fair was more than doubled. The terminus of the London-Brussels air service, previously at Evere, is now in the suburb of Haeren. An aerial service, Amsterdam-Brussels-Basle, and also Brussels-Paris, has been instituted. The town administration is directed by a burgomaster and sheriffs at the head of a town council, whose headquarters are in the *hôtel de ville*. In the Brussels agglomeration are 15 suburbs or communes and parts of two others, each self-governing, with burgomaster and sheriffs located in a *Maison Communale*. The suburban communes are: Anderlecht, Etterbeek, Forest, Ixelles, Jette, Koekelberg, Molenbeek St. Jean, St. Gilles, St. Josse-ten-Noode, Schaerbeek, Uccle, Woluwe St. Lambert, Laeken, Haeren and Neder Overheembeek with parts of Molenbeek and Schaerbeek. Recent enlargements of boundaries have greatly extended the area of the city proper, which covered 12½ sq.m. in 1921. The population, with suburbs, was 801,900 in 1925. In 1856 the population of the city alone was 152,828: it was still only 194,196 in 1904. The great increase has been in the suburbs, which had 436,453 inhabitants in 1904. The effective increase of population has not, therefore, been so large as the figures for the administrative unit would imply.

**The Port of Brussels.**—The harbour works planned in 1896 were completed in 1908, and the Willibroek canal, constructed in the 16th century, and giving access to the Rupel and the Schelde, was enlarged to provide a waterway for steamers drawing 24 feet. The basins built were later found to be inadequate and were filled in (1910) and the outer port between Laeken and Vilvorde, with a canal 18½m. long leading to the Rupel and the Schelde, taking vessels drawing 19ft., was opened in 1922. Brussels is thus only about 33m. farther from the sea than Antwerp. The port now has three docks: the Vertoge, covering 28ac., the Junction dock connecting the port with the Brussels-Charleroi canal, and the Bata-lage dock for barges. Imports include timber and colonial goods, while exports comprise plate and window glass, iron, sugar, marble, coal, candles and nails.

**BRUSSELS SPROUTS**, a variety of cabbage (*Brassica oleracea* var. *gemmifera*). This vegetable in its seedling stage and early life closely resembles the common cabbage, but later the axillary buds along the erect stem, about 2 ft. to 3 ft. high, develop into very small heads or "sprouts," similar to a head of cabbage but only about an inch in diameter. The origin of this variant of the cabbage is obscure but there are records indicating its sale in the markets of Belgium as early as the year 1213. It is a popular vegetable in England and on the Continent but in the United States it is only sparingly grown, commercial produc-

tion being limited to a few districts, of which Long Island, N.Y., and parts of California are the most important. Brussels sprouts may be steamed or boiled, but if the delicate flavour is to be preserved, should be cooked only until tender. They are at their best when served with a butter sauce to which a little garlic has been added. Cream sauce and cheese sauce are also used (*see CABBAGE*).

**BRUT, BRUTE or BRUTUS THE TROJAN**, a legendary British character, who, according to Geoffrey of Monmouth and others, was the eponymous hero of Britain. He was reputed to be grandson of Aeneas, and the legend was that he was banished from Italy and made his way to Britain, where he founded New Troy (London). The name is an obvious confusion between Bryt (a Briton) and the classical name Brutus.

For the romance literature of the subject *see* WACE and BARBOUR.

**BRUTII**, an ancient tribe of lower Italy. This tribe, called *Bruttii* and *Brittii* in Latin inscriptions, and *Brettioi* on Greek coins and by Greek authors, occupied the southwestern peninsula of Italy in historical times, the *ager Bruttius* (wrongly called *Bruttium*) corresponding almost exactly to the modern Calabria. It was separated from Lucania on the north by a line drawn from the mouth of the river Lâus on the west to a point a little south of the river Crathis on the east. To part or the whole of this peninsula the name *Italia* was first applied. In alliance with the Lucanians the Bruttii made war on the Greek colonies of the coast and seized on Vibo in 356 B.C., and held it until it became a Latin colony at the end of the same century. The Bruttii were at the height of their power during the 3rd century B.C. Their chief towns were Consentia (Cosenza), Petelia (near Strongoli), and Clamptia (Amantea). To this period (about the time of the Roman war against Pyrrhus) belongs the series of their coins, and they appear to have retained the right of coinage even after their final subjugation by the Romans. Objects of Greek origin are found in their tombs and they spoke the Greek language as well as their own (*bilingues* in Ennius).

The Bruttii first came into collision with the Romans during the war with Pyrrhus, to whom they sent auxiliaries; after his defeat they submitted and were deprived of half their territory in the Sila forest, which was declared state property. In the war with Hannibal they were among the first to declare in his favour after the battle of Cannae, and it was in their country that Hannibal held his ground during the last stage of the war (at Castrum Hannibalis on the gulf of Scylacium). They spoke Oscan as well as Greek, and two or three Oscan inscriptions in Greek alphabet still testify to the language spoken in the town in the 3rd century B.C. The Bruttians, though at this date speaking the same language (Oscan) as the Samnite tribe of the Lucani, were not actually akin to them. The name *Bruttii* was used by the Lucanians to mean "runaway slaves," but it is considerably more likely that this signification was attached to the tribal name of the Bruttii from the historical fact that they had been conquered and expelled by the Samnite invaders. The evidence of tradition (especially Aristotle, *Pol.* 4 [7] 10) shows that the customs of the Bruttii had a certain affinity with those of the pre-Hellenic inhabitants of Greece, and it has been argued that a tradition made it probable that they were called *Ἰελασγοί*. On this evidence they were part of what is now generally called the Mediterranean race. Many Indo-European elements appear in their place-names (e.g., *Sila*—Latin *silva*, Greek *ὕλη*; *Temesa*, cf. Gr. *Τέμενος*, or Sanskrit *tamas*, darkness, shadow), and none that suggest a non-Indo-European origin. They may have been akin to the Siceli.

**History.**—The Bruttii entirely lost their separate existence at the end of the Hannibalic war; in 194 B.C. colonies of Roman citizens were founded at Tempa and Croton, and a colony with Latin rights at Hipponium, called Vibo Valentia. In 132 B.C. the consul P. Popillius built the great road from Capua through Vibo and Consentia to Rhegium. Spartacus held out a long time in the Sila (71 B.C.). Vibo was the naval base of Octavian in the conflict with Sextus Pompeius (42–36 B.C.).

The most important products of the district were the wood from the forests of the Sila and the pitch produced from it. The coast plains were in parts very fertile, especially the lower valley of the

Crathis. Under the empire the Sila was state domain, and most of the rest in the hands of large proprietors. Augustus joined it with Lucania to form the third region of Italy. Diocletian placed Lucania and Brittii (as the name was then spelt) under a *corrector*, whose residence was at Rhegium. From the 6th century A.D., after the fall of the Ostrogothic power and the establishment of that of Byzantium, the name Calabria was applied to the whole of the south Italian possessions of the Eastern empire, and the name of the Brittii entirely disappeared. After the eastern peninsula (the ancient Calabria) had been taken by the Lombards, about A.D. 668, the western retained the name and still keeps it.

**BIBLIOGRAPHY.**—*See* Strabo vi., p. 253–265; Dion. Halic. xx. 1, 4, 15; Pliny, *Nat. Hist.* iii. 71–74; Justin xii. 2, xxiii. 1; C. Hülsen in Pauly-Wissowa's *Realencyklopädie*, iii. pt. i. (1897); R. S. Conway, *The Italic Dialects* (1897), for Bruttian inscriptions and local and personal names; J. E. Sandys, *Companion to Latin Studies* (1921), with useful bibliography.

**BRUTUS** (originally an adjective meaning "heavy," "stupid," kindred with Gr. *βαρύς*, cf. Eng. "brute," "brutal"), the surname of several distinguished Romans belonging to the Junian gens.

(1) **LUCIUS JUNIUS BRUTUS**, one of the first two consuls, 509 B.C. According to the legends his father and elder brother had been put to death by the reigning family. Brutus took a leading part in the expulsion of the Tarquini, and was elected consul, or rather praetor, the original title (Livy i. 59), with Collatinus. When the two sons of Brutus joined in a conspiracy for the restoration of the Tarquins, he himself sentenced them to death (Livy ii. 3). Brutus fell in single combat with Tarquin's son, during a battle with the Etruscans, who were trying to restore the dynasty (Livy ii. 6; Dion. Halic. v. 14).

(2) **DECIMUS JUNIUS BRUTUS**, consul 138, surnamed Gallaecus from his victory over the Gallaeci (136) in the north-west of Spain (Plutarch, *Tib. Gracchus*, 21). He was a patron of literature, and a friend of the poet Accius (Livy, *Epit.* 55; Appian, *Hisp.* 71–73; Vell. Pat. ii. 5; Cicero, *Brutus*, 28).

(3) **MARCUS JUNIUS BRUTUS**, a jurist of high authority, was considered as one of the founders of Roman civil law (Cicero, *De Oratore*, ii. 33, 55).

(4) His son, of the same name, made a great reputation at the Bar, and from the vehemence of his speeches became known as "the Accuser" (Cicero, *De Officiis*, ii. 15).

(5) **DECIMUS JUNIUS BRUTUS** (Albinus), born about 84 B.C., first served under Caesar in Gaul, and afterwards commanded his fleet. Caesar made him his master of the horse and governor of Gaul, and, in case of Octavian's death, nominated him as one of his heirs. Nevertheless he joined in the conspiracy against his patron, and was one of his assassins. He then went to his province of Cisalpine Gaul, which he held for the Republicans against Antony until, deserted by his soldiers and betrayed by a native chief, he was put to death by Antony's orders (43), while attempting to escape to Brutus and Cassius in Macedonia. He figures in Cicero's correspondence. (*See* Appian, *B.C.* iii. 97; Dio. Cassius, xlv. 53; Caesar, *B.G.* iii. 11, *B.C.* i. 36, 45.)

(6) **MARCUS JUNIUS BRUTUS** (85, according to some, 79 or 78–42 B.C.), supported the cause of Pompey against Caesar, but was pardoned by the latter after the victory of Pharsalus, and subsequently appointed governor of Cisalpine Gaul (46), a post which he apparently filled with credit. In 44 he was city praetor, and Caesar promised him the governorship of Macedonia at the expiration of his term of office. But at the prompting of Cassius he became leader of the conspiracy against the dictator, and was himself one of the assassins. But the republicans had no programme, and in 44 he fled to the East with Cassius, seized Macedonia and raised forces against Antony. But at Philippi (42) they were defeated by Antony and Octavian, and Brutus committed suicide.

Brutus was generally friendly with Cicero, who dedicated several works to him, but there were disagreements between them, and Cicero frequently speaks of his lack of enthusiasm. Probably the Romans admired him for his respectability, the old-fashioned *gravitas*. He was slow in decision, amazingly obstinate and in his financial dealings with the provincials, both extortionate and cruel (Cic. *ad Att.* vi. 1. 7). Shakespeare's portrait of him is far too

flattering. He wrote philosophical treatises and poetry, but nothing has survived. We possess part of his correspondence with Cicero (two books out of an original nine), which are now regarded as genuine with two possible exceptions. The Greek letters of Brutus are probably the composition of some rhetorician.

See J. L. Strachan-Davidson, *Cicero* (1894); G. Boissier, *Cicero and his Friends* (Eng. trans. 1897); E. T. Bynum, *Das Leben des M. J. Brutus* (1898); Tyrrell and Purser's edition of Cicero's Letters (refs. in index vol. s.v. "Iunius Brutus," especially introductions to vols. iii. and v.); other authorities under CAESAR; CICERO.

**BRÜX:** see MOST.

**BRY, THEODORUS (DIRK) DE** (1528–1598), German engraver and publisher, born in Liège in 1528 and died at Frankfurt-on-Main, March 27, 1598. He established an engraving and publishing business at Frankfurt, and also visited London in or before 1587. Here he became acquainted with the geographer, Richard Hakluyt, with whose assistance he collected materials for a finely illustrated collection of voyages and travels, *Collectiones Peregrinationum in Indiam Orientalem et Indiam Occidentalem* (25 parts, 1590–1634). Among other works he engraved a set of 12 plates illustrating the Procession of the Knights of the Garter in 1576, and a set of 34 plates illustrating the Procession at the Obsequies of Sir Philip Sidney; plates for T. Hariot's *Briefe and True Report of the new found Land of Virginia* (Frankfort, 1595); the plates for the first four volumes of J. J. Boissard's *Romanae Urbis Topographia et Antiquitates* (1597–98), and a series of portraits entitled *Icones Virorum Illustrium* (1597–99). De Bry had been assisted by his eldest son, Johannes Theodorus de Bry (1561–1623), who carried on the *Collectiones* and the illustration of Boissard's work, and also added to the *Icones*.

**BRYAN, WILLIAM JENNINGS** (1860–1925), American politician and orator, was born in Salem, Ill., on March 19, 1860. He graduated from Illinois college in 1881 and from the Union college of Law, Chicago, in 1883. He practised his profession at Jacksonville, Ill. from 1883 to 1887, when he removed to Lincoln, Neb. There he soon became conspicuous both as a lawyer and as a politician, attracting particular attention by his speeches during the presidential campaign of 1888 on behalf of the candidates of the Democratic Party. From 1891 to 1895 he represented the First Congressional district of Nebraska, nominally Republican, in the national House of Representatives. He soon attracted attention as a conscientious worker and became widely known for his ability in debate. His first great speech (March 16, 1892) was against the policy of protection, and on Aug. 16, 1893 he made a remarkable speech against the repeal of the silver purchase clause of the Sherman Act. Although the immediate loser in this contest, he attained a national reputation as the leader of the "free-silver" movement. In 1894 he was a candidate for the U.S. Senate but was defeated in a campaign largely restricted to the silver question. From 1894–96 he edited the *Omaha World Herald*, in which he championed the cause of bimetallicism.

Although defeated in all elections in which he subsequently appeared as candidate, he was the recognized leader of his party for the next 30 years. His panacea for the industrial, and especially the agrarian evils of the day was "free-silver." In 1896 he was sent as delegate to the Democratic National convention at Chicago, and there easily captured control of the convention, wrote the party platform, which contained a plank providing for bimetallicism, and in defence of his proposition delivered a celebrated speech containing the passage, "You shall not press down upon the brow of labour this crown of thorns; you shall not crucify mankind upon a cross of gold." As leader of the "silver" majority he became the Democratic nominee for president. Subsequently, he received the nominations of the Populists and the National Silver Parties. In the ensuing presidential campaign he travelled over 18,000 m., and made altogether 600 speeches in 27 different States—an unprecedented number. In the election, however, he was defeated by William McKinley, the Republican candidate, receiving 176 electoral votes to 271. During the Spanish-American War he was colonel in the 3rd Nebraska Volunteers, but saw no active service. Even though he lent his support to

the ratification of the peace treaty, he opposed the permanent acquisition of the Philippines and in 1900 was again nominated for the Presidency on a platform that declared against "imperialism" and for "free-silver." He was a second time defeated by McKinley, receiving 155 electoral votes to 292. After the 1900 election Bryan established and edited at Lincoln a weekly political journal *The Commoner*, which attained a wide circulation.

Although not an active candidate for the Democratic nomination in 1904, he was in attendance and assisted materially in framing the platform. The conservative element of the party had once more resumed control and nominated Judge Alton B. Parker of New York. In 1905–06 he made a trip around the world, and in London was cordially received as a great American orator. He was again nominated for the Presidency by the Democratic Party at its National convention at Denver in 1908. The free-silver theory was now dead, and while the chief issue was over the formulation of a trust policy, the campaign was confused by personal issues, Roosevelt himself intervening in favour of Taft, the Republican nominee. Bryan was again defeated, receiving 162 electoral votes to 321 for Taft. In 1912, Bryan announced that he was not a candidate for the Democratic presidential nomination, but he attended the convention, dictated the platform, and inspired the general tone of proceedings at Baltimore, and it was largely owing to his influence that the nomination went to Woodrow Wilson, instead of to Champ Clark. In recognition of this service Wilson appointed him secretary of State in 1913.

As secretary of State he devoted much attention to the negotiation of peace treaties with foreign nations, whereby the signatory powers were bound to submit all disputes to impartial inquiry and delay a full year for arbitration before going to war. These were agreed to in principle by 31 nations. The World War interrupted the movement. In 1913 he was sent to California, where he urged, unsuccessfully, that the State legislature and the governor should delay action on the proposed Webb anti-alien land ownership bill, so displeasing to the Japanese Government. In 1914 he supported the repeal of the Panama Canal tolls bill, which excluded American coastwise shipping from the payment of fees.

From the outbreak of the World War, Bryan was deeply interested in attempts to restore peace. He opposed foreign war loans to belligerents, but as vigorously opposed an embargo on the shipment of arms as contrary to international law. After the sinking of the "Lusitania" (May 7, 1915) he signed the first strong note of protest to Germany. When the President wrote his second "Lusitania" note, Secretary Bryan resigned (June 8, 1915), saying in his letter of resignation, "You have prepared for transmission to the German government a note in which I cannot join without violating what I deem to be an obligation to my country." He continued, after his resignation, to work in the interest of peace; opposed the Anglo-French war loan; attacked the Navy League and the National Security League; and tried to resist the growing demands for preparedness in America. However, when war was actually declared he asked to be enrolled as a private, though then 57 years of age; he urged loyal support of the President's war measures, and in his own paper, *The Commoner*, strongly condemned obstruction of the selective draft.

In 1916 Bryan was defeated in Nebraska as candidate for delegate-at-large to the Democratic National convention, but went as a reporter and gave full support to the re-nomination of Wilson. He was sent as a delegate to the 1920 convention at San Francisco, but when his motion for the introduction of a "dry" plank in the platform was defeated, he took no further interest in the proceedings. The same year he refused the presidential nomination of the Prohibition Party, although he had been a tireless worker for the cause for the past ten years. In 1921 he moved to Miami, Fla., and in 1924 attended the Democratic National convention in New York as a delegate from Florida, but he exercised very little influence in the party councils. As a politician his work was completed. Bryan laboured earnestly for the most important "progressive" measures adopted by the United States in recent years, the popular election of senators, an income tax, the requirements of publication of ownership and circulation of

newspapers, the creation of the department of labour, national prohibition and woman suffrage, and their adoption was due in part to his popular persistent appeal.

His last public appearance was in 1925 at the trial of J. T. Scopes, a school teacher of Dayton, Tenn., who was arrested on a charge of violating the State law prohibiting the teaching in public schools of any theories that deny the divine creation of man as taught in the Bible. Scopes was a biologist and had been teaching evolution. Bryan, a firm believer in the literal interpretation of the Bible, went to Dayton to assist the prosecution. Widespread popular interest was manifested in the case, which in the hands of Bryan and Clarence Darrow, chief defence counsel, assumed the form of a contest between fundamentalism and modernism. The outcome was that on July 21, after a hearing extending over three weeks, Scopes was found guilty and fined \$100, though Bryan was prevented, through the tactics of Darrow, from delivering the elaborate speech which he had prepared in refutation of Darwin's theories. On the conclusion of the trial he was taken ill, and died at Dayton, Tenn., on July 26, 1925.

J. and Mary Baird Bryan, *Memoirs of William Jennings Bryan* (1925); Charles E. Merriam, *Four American Party Leaders* (1926); J. C. Long, *Bryan, The Great Commoner* (1928); and Paxton Hibben, *The Peerless Leader, William Jennings Bryan* (1929).

**BRYAN**, an incorporated village near the north-west corner of Ohio, U.S.A., served by the New York Central and the Toledo and Indiana (electric) railways; the county seat of Williams county. The population was 4,252 in 1920; 1930 it was 4,689. The agricultural specialties of the region are grain, sugar-beets, potatoes and dairy products. Among the manufactures of the village are wheelbarrows, showcases, toys, art metal products and condensed milk. Bryan was settled about 1833 and incorporated in 1849.

**BRYAN**, a city of Texas, U.S.A., 85m. N.E. of Austin, served by the Missouri Pacific and the Southern Pacific railways, the county seat of Brazos county. The population in 1920 was 6,307, and in 1930 it was 7,814. It is in a fertile region, producing cotton, corn, peanuts, poultry, etc.; the city has a variety of manufacturing industries. At College Station, 5m. S.E. on a tract of 2,416ac., is the Agricultural and Mechanical College of Texas, established in 1871 and opened in 1876, which has an enrolment of about 2,500 men, exclusive of the summer session. The college has one of the largest units of the Reserve Officers' Training Corps established under the National Defence act of June 3, 1916. A basic course in military training is required of all students, with certain exceptions, and there are extensive advanced courses in military science and tactics for infantry, field artillery, signal corps, cavalry and air corps. The discipline of the institution is administered by the commandant, an officer of the U.S. Army. Bryan has a commission manager form of government.

**BRYANSK (BRIANSK)**, a town and province in the Russian Socialist Federal Soviet Republic. (1) The province has an area of 40,926sq.km. The boundaries are:—north-west, Smolensk; north-east, Kaluga; east, Orlov; south-east, Kursk; south-west, Chernigov; west, Gomel. Pop. (1926) 1,994,565; urban 179,438, rural 1,815,127. Sands and tenacious clays predominate, with marshy land, and there is much deciduous forest. Beekeeping, timber trade, tar and pitch industries are carried on in the forest areas, and in the sown areas the crops include rye, oats, barley, wheat, hemp, potatoes, hops, vegetables, tobacco and fruit. Industries are increasing and there are factories for iron goods, machinery, ropes (especially at Karachev), leather, soap, tobacco and chemical produce.

(2) The town of Bryansk, Lat. 53° 13' N., Long. 34° 25' E., pop. (1926) 25,068, is at the limit of navigation of the Desna river, in the centre of a lowland plain with branching valleys carved out of the plateau by the Desna and its tributaries, especially the Bolva. It is a railway junction (six lines) and north of the town are the Maltsov iron works, glass factories and rope works, employing thousands of workers. There are also saw-mills, flour mills and timber factories. It trades in timber, tar,

pitch, hemp and cattle. It is an old city, mentioned in 1146 as Debryansk, afterwards forming a separate principality, which ended in 1356. After the Mongol invasion of 1241, it was in the power of Lithuania and did not become Russian till the 17th century.

**BRYANT, JACOB** (1715–1804), English antiquarian and writer on mythological subjects, was born at Plymouth, and held a post in the ordnance department. He was a great collector of books, and left his library to King's college, Cambridge, having, however, previously made some valuable presents from it to the king and the duke of Marlborough. Bryant was the author of many works on ancient history and on theology, the best known at the time being his *New System, or An Analysis of Ancient Mythology* (1774–1776), now forgotten, and his *Observations* (1781) on the poems of Thomas Rowley, which played a considerable part in the Rowley controversy.

**BRYANT, SOPHIA** (1850–1922), English educationalist, daughter of the Rev. W. A. Willock, was born in Dublin, Feb. 15, 1850, and was educated at Bedford college, London. She was from 1875 to 1895 form mistress at the North London Collegiate School for Girls. In 1881 she graduated B.Sc. with honours in mathematics and moral science and was the first woman admitted D.Sc. (1884). From 1895 to 1918 she was headmistress of her school and served on many important educational committees. In 1904 the hon. degree of Litt.D. was conferred on her at Dublin university. She met her death in a mountaineering accident near Chamonix in 1922. She published many educational works and several books on early Irish history.

**BRYANT, WILLIAM CULLEN** (1794–1878), American poet and journalist, was born at Cummington, a farming village in the Hampshire hills of western Mass., on Nov. 3, 1794. He was the second son of Peter Bryant, a physician and surgeon and a man of scholarship. Peter Bryant was the great-grandson of Stephen Bryant, an English Puritan emigrant to Massachusetts about 1632. The poet's mother, Sarah Snell, was a descendant of "Mayflower" pilgrims. Bryant's early education was limited. After the village school he received a year of exceptionally good training in Latin under his mother's brother, the Rev. Dr. Thomas Snell, of Brookfield, followed by a year of Greek under the Rev. Moses Hallock, of Plainfield, and at 16 entered the sophomore class of Williams college. Here he was an apt and diligent student through two sessions, and then, because of the straitness of his father's means, he withdrew without graduating and studied classics and mathematics for a year in the vain hope that his father might yet be able to send him to Yale college. But the length of his school and college days would be a misleading measure of his training. He possessed many traits which often are established only by books and institutional regimens, as well as an impulse toward scholarship and citizenship. It is his own word that, two months after beginning with the Greek alphabet, he had read the entire New Testament. On abandoning his hope of entering Yale, he studied law under private guidance at Worthington and at Bridgewater. At 21 he was admitted to the bar, opened an office in Plainfield, presently withdrew from there, and at Great Barrington settled for nine years in the attorney's calling, for which he had an aversion that he never lost. His first book of verse, *The Embargo, or Sketches of the Times; A Satire by a Youth of Thirteen*, had been printed at Boston in 1808.

At the age of 26 Bryant married, at Great Barrington, Miss Frances Fairchild, with whom he enjoyed a happy union until her death nearly half a century later. In 1825 he removed to New York city to assume a literary editorship. Here for some months his fortunes were precarious, until in the next year he became one of the editors of the *Evening Post*. In 1829, he came into undivided editorial control, and became also chief owner. He died in 1878, in the month of his choice, as indicated in his poem "June."

Bryant was a man of retiring and contemplative nature, and in his journalistic capacity and in daily debate was a counsellor rather than a leader. He stood for principles more than for measures.

His renown as a poet antedated the appearance of his first volume by about four or five years. "American poetry," says Richard Henry Stoddard, "may be said to have commenced in 1817 with . . . (Bryant's) 'Thanatopsis' and 'Inscription for the entrance of a wood.'" He wrote "Thanatopsis" at Cummingtown in his 18th year, and it was printed in 1817 in the *North American Review*; the "Inscription" was written in his 19th, and in his 21st while at Bridgewater, he composed "To a Water-fowl."

His gift for language made him a frequent translator, and among his works of this sort his rendering of Homer is the most valuable. His poems, characterized by the equal purity of their artistic and their moral beauty, are, on the ethical side, more than pure; they are—it may be said without derogation—Puritan. He never commended with unloveliness for any loveliness that may be plucked out of it, and rarely discovered moral beauty under any sort of mask. Free from effeminacy and indelicacy, Bryant possessed a self-restraint that never permitted emotional transports in his works, which contain scarcely a distempered utterance or a passionate exaggeration. Even when he essayed to speak for spirits unlike his own he never portrayed any overmastering passion. The nearest he ever came to mirth was in "Robert of Lincoln," and the nearest to sorrow in writing of his young sister, "The Death of the Flowers."

Bryant published volumes of *Poems* in 1821 (Cambridge) and 1832 (New York), and many other collections were issued under his supervision, the last being the *Poetical Works* (1876). Among his volumes of verse were *The Fountain and other poems* (1842); *The White-Footed Deer and Other Poems* (1844); *Thirty Poems* (1864); and blank verse translations of *The Iliad of Homer* (Boston, 1870) and of *The Odyssey of Homer* (Boston, 1871). His *Poetical Works* and his *Complete Prose Writings* (1883 and 1884) were edited by Parke Godwin, who also wrote *A Biography of William Cullen Bryant, with Extracts from his private Correspondence* (1883). See also J. Grant Wilson, *Bryant and his Friends* (1886); John Bigelow, *William Cullen Bryant* (Boston, 1890), in the "American Men of Letters" series; W. A. Bradley, *Bryant*, in the "English Men of Letters" series (1905); E. C. Stedman, *Poets of America* (1885); and biographical and bibliographical introductions by Henry C. Sturges and Richard Henry Stoddard to the "Roslyn edition" of his *Poetical Works* (1903). For more recent critical estimates, see Norman Foerster, "Nature in Bryant's Poetry," *So. Atlantic Quart.*, vol. xvii, pp. 10-17 (Durham, N. C., 1918); F. L. Pattee, *Side Lights on American Literature* (1922); W. L. Phelps, *Howells, James, Bryant and Other Essays* (1924); and E. W. Gage, "William Cullen Bryant," *Jour. of Am. Hist.*, vol. xix, pp. 279-286 (Greenfield, Ind., 1925).

**BRYAXIS**, one of the four great sculptors who worked on the mausoleum at Halicarnassus, about 350 B.C. His work on that monument cannot be separated from that of his companions, but a basis has been discovered at Athens bearing his signature and adorned with figures of horsemen in relief. He is said to have made a great statue of Serapis for Sinope, but as to this there are grave historic difficulties. He also made a great statue of Apollo, set up at Daphne near Antioch.

See E. A. Gardner, *Handbook of Greek Sculpture*, ii. 374.

**BRYCE, JAMES BRYCE**, 1ST VISCOUNT (1838-1922), British statesman, jurist and author, was born at Belfast on May 10, 1838, of a Scottish family. His father, James Bryce (d. 1877), was a schoolmaster, and moved in 1846 to Glasgow, where James attended the high school and then the university. In 1857 Bryce went to Trinity College, Oxford, where he had an extraordinarily brilliant record, and in 1862 was elected a fellow of Oriel. When he began to read for the Bar he had already published his *Holy Roman Empire* (1864), the brilliant piece of historical work which had won the Arnold Historical Essay prize in 1863, and which is still indispensable to the student.

Bryce was called to the Bar at Lincoln's Inn in 1867; in the next year he began to lecture on law at Owen's college, Manchester, and in 1870, became Regius Professor of Civil Law at Oxford, a position which he held until 1893. "Bryce, who had sat at the feet of Van Vangerow in Heidelberg, conceived it," says Mr. H. A. L. Fisher, "to be part of his duty to awaken an interest in the civil law not as an antiquarian curiosity, but as a great power in the moulding of European thought and history." He practised at the Bar until 1882. In 1870 he had made the first of a series of visits to America, in which he laid the foundations of his knowledge of American institutions and American life, and in 1876 a

visit to Caucasus, Armenia and Constantinople, the beginning of his lifelong interest in the Armenians. He founded the Anglo-Armenian Society, and after he entered the House of Commons (for Tower Hamlets), he constantly urged their cause.

Bryce's learning and firsthand knowledge of many countries made him indispensable in the councils of the Liberal party, but he never carried in the House of Commons the weight of less able men with the true "parliamentary gift." He had much in common with Mr. Gladstone, not least on the literary side. In the autumn of 1885 he went to his native town of Belfast to tell Ulster Liberals of the coming proposals for Irish Home Rule, and in the Gladstone Government of Jan.-Aug. 1886 he was under-secretary for foreign affairs. The next year was spent on *The American Commonwealth* (published 1888) on which he had been working since 1883. This book was the first important work on the subject, and is still the classic in its field. Bryce brought to his task not only historical knowledge, but the trained mind of the jurist, and the sympathy of a friend of the American people and an admirer of their institutions. In the Gladstone Government of 1892 he was chancellor of the Duchy of Lancaster, and in the reconstructed Rosebery cabinet of 1894 president of the Board of Trade. He presided over the important commission on secondary education in 1894 which laid the foundation of the English system.

After the defeat of the Liberal Government he travelled (1895) in South Africa, visiting the outlying territories as well as the Cape and the Boer republics; his book *Impressions of South Africa* appeared in 1897. He protested against the handling of the negotiations with the Boer republics in the following years, and in the split in the Liberal party which followed the outbreak of war in 1899 Bryce ranged himself with Campbell-Bannerman in the campaign against Mr. Chamberlain and his policy. Throughout the war Bryce was an uncompromising fighter on the unpopular side. In the Campbell-Bannerman cabinet of 1905 Bryce was chief secretary for Ireland, and in 1907 the prime minister sent him as ambassador to Washington. For six years Bryce was the interpreter of Great Britain to the American people. The appointment of a politician, outside the diplomatic service, was criticized at the time, but it was a most happy one. Bryce had many friends in political, learned and literary circles in America, and he was known throughout the States as the author of the classic work on the American Commonwealth, on its institutions, its laws, and its structure. He had already paid seven visits to America, the last being in 1904 when he had delivered an address at the St. Louis Exhibition and the Godkin lectures at Harvard and Columbia. While Bryce was at Washington the difficulty between America and Newfoundland about fisheries was referred to The Hague Tribunal for final settlement. Most of the questions with which he had to deal related to the relations between the United States and Canada, and in this connection he paid several visits to Canada to confer with the governor-general and his ministers. He was criticized, both in England and in Canada, for forwarding, in 1911, in the course of his duties as ambassador, an arrangement for reciprocity between the two North American States; but the general election, which substituted Sir R. Borden as prime minister of Canada for Sir W. Laurier, put an end to the negotiations. At the close of his embassy he told the Canadians that probably three-fourths of the business of the British embassy at Washington was Canadian, and of the 11 or 12 treaties he had signed nine had been treaties relating to the affairs of Canada. "By those nine treaties," he said, "we have, I hope, dealt with all the questions that are likely to arise between the United States and Canada—questions relating to boundary; questions relating to the disposal and the use of boundary waters; questions relating to the fisheries in the international waters where the two countries adjoin one another; questions relating to the interests which we have in sealing in the Bering Sea, and many other matters." He could boast that he left the relations between the United States and Canada on an excellent footing.

For his services he was created a viscount in 1913, and in 1914 his old university, Oxford, gave him an honorary degree. He was extremely reluctant in the last days of July 1914 to contemplate

the possibility of war with Germany; but the violation of Belgian neutrality and the outrages committed in Belgium by German troops turned the scale for him. He was chairman of the committee to consider the evidence of such outrages not only in Belgium but in France. He welcomed warmly the entrance of the Americans into the World War in the spring of 1917.

He presided over a committee set up in that year to consider the reconstruction of the House of Lords, and spent much labour in a task which all parties were disposed to shirk. During these latter years he was largely engaged on the composition of his book on *Modern Democracies*, a comparative study of a certain number of popular governments in their actual working, for which he had been gathering material for several years before the war. Lord Bryce married, in 1880, Elizabeth Marion, daughter of Thomas Ashton, of Hyde, and sister of the 1st Lord Ashton of Hyde. He received the Order of Merit in 1907 and a G.C.V.O. in 1918. His last speech in the House of Lords was on the Irish treaty in Dec. 1921, and his last public address (apart from addresses to learned societies) was an appeal on behalf of the Armenians at the Mansion House, London. He died at Sidmouth on Jan. 22, 1922.

Bryce's works are *The Holy Roman Empire* (1864); *Trade Marks, Registration Act and Trade Mark Law* (1877); *Transcaucasia and Ararat* (1877); *The American Commonwealth* (1888); *Impressions of South Africa* (1897); *Studies in History and Jurisprudence* (1901); *Studies in Contemporary Biography* (1903); *South America* (1912); *University and Historical Addresses* (1913); *Modern Democracies* (1921); *International Relations* (1922). See H. A. L. Fisher, *James Bryce* (1927).

**BRYCE CANYON**, a scenic tract comprising about 11 sq.m. in Garfield county, south central Utah, U.S.A., which in 1923 was set apart as a National monument and in 1928 it was created a National Park. It contains striking examples of erosion, especially rock pinnacles of brilliant coloration which have been worn into fantastic shapes.

**BRYDGES, SIR SAMUEL EGERTON** (1762-1837), English genealogist and miscellaneous writer, was born on Nov. 30, 1762. In 1789 he persuaded his elder brother that their family were the heirs to the barony of Chandos, being descended from a younger branch of the Brydges who first held the title. The case was tried and lost. He re-edited Collin's *Peerage*, inserting a statement about his supposed right. He sat in Parliament for Maidstone from 1812-18. In 1814 he was made a baronet, and in 1818 he left England. He died at Geneva on Sept. 8, 1837. Brydges was a most prolific author; he is said to have written 2,000 sonnets in one year. His numerous works include *Poems* (1785); *Censura Literaria* (1805-09); *The British Bibliographer* (4 vols., 1810-14), with J. Haslewood; *Restituta* (4 vols., 1814-16), containing accounts of old books; and *Autobiography, Times, Opinions and Contemporaries of Sir S. E. Brydges* (1834). He published various Elizabethan texts, at considerable expense to himself.

See W. T. Lowndes, *Bibliographer's Manual* (ed. H. G. Bohn, 1857-64).

**BRYENNIUS, NICEPHORUS** (1062-1137), Byzantine soldier, statesman, and historian, was born at Orestias (Adrianople). He gained the favour of Alexius I. (Comnenus) and the hand of his daughter Anna, with the titles of Caesar (then ranking third) and *Pankhypersebastos* (one of the new dignities introduced by Alexius). Bryennius successfully defended Constantinople against Godfrey of Bouillon (1097); conducted the peace negotiations between Alexius and Bohemund, prince of Antioch (1108); and played an important part in the defeat of Malik-Shah, Seljuk sultan of Iconium (1116). He was friendly with the new emperor, John, whom he accompanied on his Syrian campaign (1137), but was forced by illness to return to Byzantium, where he died in the same year. At the suggestion of his mother-in-law he wrote a history (called by him *Τὰν Ἰστορίαν*, materials for a history) of the period from 1057 to 1081, from the victory of Isaac I. (Comnenus) over Michael VI. to the dethronement of Nicephorus Botaneiates by Alexius.

Edito princeps, P. Possinus, 1661; see also J. Seger, *Byzantinische Historiker des 10. und 11. Jahrhunderts* (1888), and C. Krumbacher, *Geschichte der byzantinischen Literatur* (1897).

**BRYNMAWR**, largest town in Breconshire, Wales. Population (1931) 7,247. It is situated in the extreme south of the county on the borders of Monmouthshire and marks the northern limit of the south Wales industrial area. It owes its origin to the rapid development of the iron smelting industry early in the 19th century, when the success of the Cyfarthfa furnaces at Merthyr Tydfil led to the reopening of old ironworks in Ebbw Vale, Nantyglo, Beaufort and the surrounding districts. In 1831 a tram way was built to carry limestone to the furnaces at Nantyglo; this crossed the Merthyr to Abergavenny coach road near the Prince of Wales hotel. Later, a road was built linking the Monmouthshire valleys with the old east and west road just mentioned. In the triangle thus formed Brynmawr grew up. In this, unlike most of the mining centres of south Wales, Brynmawr is not a straggling village in the valley bottom, but is situated, as its name implies, (*bryn*=hill; *mawr*=great), on high ground, surrounded by open moorland, which gives the town an exposed and bleak appearance. Owing to its proximity to the agricultural area, the town has grown as a market centre, although it is primarily industrial. With the passing of the importance of iron smelting, the town has relied more and more on coal mining and the large steel works at Ebbw Vale. The rapid rise of road transport has made the town, in virtue of its position at the head of many valley roads, a centre of motor traffic.

**BRYN MAWR COLLEGE**, situated in the suburbs of Philadelphia at Bryn Mawr, Pa., was founded in 1885 in order to establish and maintain an institution of advanced learning for women, by the will of Dr. Joseph W. Taylor, a member of the Society of Orthodox Friends. The government of the college is vested in a corporation which includes 13 life trustees, the president of the college, two directors-at-large and five alumnae directors nominated by the Alumnae Association to the board of directors. The college is non-sectarian. The campus of exceeding beauty, with its buildings of grey stone in collegiate Gothic architecture, covers 60ac. and overlooks a broad expanse of rolling country. The buildings include the main administrative hall with class-rooms, the library (containing in 1928 about 114,000 volumes) designed to be primarily a library for special study, a science building, a gymnasium, an infirmary, a students' building containing an auditorium seating over 1,000 with a wing for the department of music, and seven halls of residence. The classes of students admitted to the college are, graduate, undergraduate and hearers. Graduate students must present a diploma from a college of acknowledged standing. The most distinguished place amongst the graduate students is held by the fellows and graduate scholars. Many European fellowships, resident and non-resident fellowships and scholarships are awarded annually. Every year six scholarships are awarded to students from European countries. Undergraduate students are admitted only by college entrance board examinations and cannot have a matriculation condition. Hearers must be at least 25 years of age; they are admitted without examination; they cannot reside in the college nor be candidates for degrees; they are admitted to courses only with the consent of the instructor. The degrees of bachelor of arts, master of arts and doctor of philosophy are conferred. In 1928 there were 79 members of the faculty and teaching staff; 382 undergraduate and 116 graduate students, representing 40 States and 12 foreign countries. Forty-four States and 25 countries were represented among the 4,600 alumnae and former students. Approximately \$60,000 is given annually in fellowships and scholarships, \$32,000 to graduate and \$28,000 to undergraduate students. (M. E. P.A.)

**BRYONY** (*Bryonia dioica*), a twining plant of the gourd family (Cucurbitaceae), native to Europe and Western Asia and common in England. It has a large white root, large palmate leaves, pale yellow flowers in axillary clusters and red berries. The black bryony (*Tamus communis*), a climbing plant of the yam family (Dioscoreaceae), of similar range, bears a black root, shining, heart-shaped leaves and scarlet berries. Both plants are poisonous but yield useful drugs.

**BRYOPHYTA**, the botanical name of the second great subdivision of the vegetable kingdom. The plants in this group are

all small, some, indeed, so minute that only the most careful observer is aware of the great variety of form and structure shown by them. It is quite common for liverworts, mosses, and even small plants of much higher groups to be indiscriminately classed together and popularly called "mosses." The Bryophyta do, however, form a well-defined class, easily recognizable with a little care, and it is equally easy to distinguish the broad sub-

FROM STRASBURGER, "TEXT-BOOK OF BOTANY," BY PERMISSION OF MACMILLAN & CO.

FIG. 1.—*MARCHANTIA POLYMORPHA*, SHOWING THE ANTHERIDIUM, WHICH GIVES RISE TO THE MALE ELEMENT IN THE PROCESS OF REPRODUCTION OF CERTAIN MOSS AND LIVERWORT PLANTS

groups into which they naturally fall. Their study necessarily entails minute observation, yet such observation shows them to be of great scientific interest, presenting as they do a special type of life history and affording in some of their groups graphic evidence of their evolutionary trend in spite of the complete absence of reliable evidence from fossil remains of any antiquity.

Speaking generally, Bryophyta grow only under moist conditions, being commonly found along the sides of ditches, banks of streams and similar places. Some can certainly grow in even what would appear to be quite dry situations, though it would be more correct to say that such forms can exist through more or less prolonged dry periods, but grow actively only when conditions are comparatively moist. Even fewer are those forms which can thrive only in or on water. Liverworts and mosses are widely distributed throughout the world and with careful search it is possible to find representatives of a wide range of forms in almost any district. Usually they occupy a subordinate place in the general vegetation but occasionally, as with bog-mosses and some arctic mosses, they dominate the vegetation.

**General Structure.**—Mosses and most liverworts, amidst all their variety of form, are similar in so far as the plant as we see it consists of a stem bearing leaves (see figs. 7, 11). Some liverworts show no differentiation into stem and leaf, but appear as flat structures closely pressed to the substratum on which they grow (figs. 3, 4). Such a habit we describe as thalloid; the plant is a thallus (*i.e.*, a structure showing no differentiation into leaf and stem) in contradistinction to the leafy shoot of the remaining liverworts and mosses; though few in number of forms, those with this thalloid habit are very widely spread and are exceedingly interesting and significant in their form and structure. The small leafy shoot or thallus, as we see it, is self-supporting, possessing chlorophyll as do other plants and rhizoids—elongated cells resembling root hairs which grow from the underside of the plant and not only attach it to the soil but convey necessary salt solutions therefrom. Most interesting of all is the fact that the liverwort and moss plant bear the reproductive organs called antheridia and archegonia. The *antheridium* when mature has a shorter or longer stalk supporting a spherical or more usually an ovoid body which consists of a wall of flattened cells enclosing a densely packed mass of very small cubical cells (fig. 1). In all cases examined, each of these cubical cells gives rise by division to two motile bodies called spermatozooids and functioning as the male element in sexual reproduction. Each

spermatozoid consists of a more or less spirally coiled, club-shaped body, pointed at its anterior end and bearing there two long cilia whose movements are responsible for the motility of the sperm. These spermatozooids are liberated from the antheridium by degeneration of the walls enclosing them. The *archegonium* also usually has a stalk and takes the form of a minute, long-necked flask (fig. 2). The wall of the flask consists of a layer of cells enclosing the ovum or egg-cell, the ventral canal cell and a row of neck canal cells. The ovum or egg-cell, the female element in sexual reproduction, occupies the lower part and most of the space of the body of the flask, the remaining upper part being occupied by the ventral canal cell, whilst the space within the neck of the flask is filled by a row of cells, the neck-canal cells, the whole being closed by a lid of cells continuous with those of the wall. When mature the lid is burst open by the mucilaginous degeneration of the neck-canal and ventral-canal cells, and fertilization is brought about by the passage of the motile spermatozooids via the mucilage to the egg-cell. In all probability the spermatozooids are attracted to the open neck of the archegonium by some chemical stimulus; in any case one spermatozoid fuses with the egg cell and fertilization is brought about. The antheridia and archegonia arise by division of a single cell, and though almost identical in mature form throughout liverworts and mosses, the development differs in detail in the two groups. These differences may be found in literature cited in the bibliography.

The fertilized ovum, two nuclei fused together, is the beginning of a new and very different stage in the life-history of these plants. This stage when completely developed varies considerably in structure in the various groups, but in general terms we may say that it consists of a capsule containing spores, sometimes borne upon a stalk, and throughout its whole life borne upon and nourished by the plant on which it arose (see figs. 4, 11). In spite of the variation in structure, the end of this stage of the life-history is in all cases the production of spores which are shed and germinate in course of time. In mosses the spore gives rise to a branched filament of cells, the *protonema*, upon which the new moss plant arises. In liverworts a protonema is scarcely recognizable, the spore growing directly into the new plant.

**Life-History.**—Here then, as in all plants higher in the scale of botanical classification, the life-history is divisible into two stages which follow each other with regular alternation. The

FROM STRASBURGER, "TEXT-BOOK OF BOTANY"

FIG. 2.—*MARCHANTIA POLYMORPHA*, SHOWING THE ARCHEGONIUM, WHICH ENCLOSES THE OVUM OR EGG CELL.

plant as we see it in the field begins its life with the spore, eventually produces antheridia and archegonia and ends that stage when a spermatozoid fuses with an ovum. This stage we call the *gametophyte*. The second stage begins with the fertilized ovum, develops into a capsule sometimes stalked, and attached to the gametophyte by a foot—the whole structure being called a *sporogonium*—and ends with the production of spores. This stage we know as the spore-bearing stage or *sporophyte*. The life-history of a liverwort and moss then consists of the regular alternation of gametophyte and sporophyte. In this life-history the

interest lies in the fact that the plant as we see it is the gametophyte, the sporophyte dependent upon it and commonly recognized as the moss "fruit" being the subordinate phase in this sense. In all other plants higher in the scale of evolution, the reverse is the case, the independent self-supporting plant is the sporophyte, the gametophyte being the subordinate partner in the life cycle, and though not always dependent upon the sporophyte, always comparatively inconspicuous (see PTERIDOPHYTA and CYTOLOGY for discussion of the fundamental nuclear difference between haploid gametophyte and diploid sporophyte).

The Bryophyta, according to their form and structure, can be subdivided into the Hepaticae (liverworts) and Musci (mosses).

FROM "STUDENT'S HANDBOOK OF BRITISH HEPATICS," PERMISSION OF THE SUMFIELD PRESS  
FIG. 3.—MARCHANTIA POLYMORPHA. A LIVERWORT WELL ADVANCED IN THE GROUP THAT SHOWS NO DIFFERENTIATION IN STEM AND LEAF

Further, the Hepaticae are clearly divisible into three smaller groups, the Marchantiales, Jungermanniales, and Anthocerotales, whilst the Musci also fall into three well-marked groups, the Sphagnales, Andreaeales, and Bryales.

#### HEPATICAE

The three groups into which liverworts are botanically divided show among their several members lines of progression in three different directions from a basal, simple type more or less common to them all. Stated broadly, evolution in liverworts has progressed from a common form along three distinct lines. From such a simple type, for instance, the Marchantiales have moved along the line of increasing complexity in texture of the thallus, the Jungermanniales have retained the simplicity of texture but show an increasing tendency to discard the thalloid and assume a leafy-shoot habit, whilst the Anthocerotales have retained both the simple texture and habit of the thallus but developed a peculiar sporogonium. These tendencies require fuller discussion.

**Marchantiales: Structure.**—Of the Marchantiales, the genus *Riccia*, with a world-wide distribution and including many species, affords the simplest organization of the group. *Riccia* consists of a flat, dichotomously-branched thallus growing appressed to the ground, attached thereto by rhizoids. The growing apex lies at the base of a heart-shaped cleft at the end of the thallus, the two lateral lobes being produced by the enlargement of cells cut off from the apical cell or cells. This thallus is thickest in its middle line but thins out towards the edges; its upper half consists of vertical columns of green chlorophyll-containing cells, its lower half of cells comparatively free from chlorophyll irregularly crowded together and acting as storage cells for the food manufactured by the upper assimilating half. Provision for aeration has here its lowest expression, being represented merely by small spaces between the vertical rows of cells in the upper half of the thallus. On the lower surface one finds the hair-like structures, rhizoids, already mentioned, and of these two types may be recognized, smooth and tuberculate. The latter, as their name implies, possess many small pegs of cellulose projecting into the cavity from the wall of the cell. In addition to rhizoids on the underside there are present small scales or plates of cells which we call ventral scales or amphigastria. *Riccia* is peculiar in that the ventral scales arise singly from the growing point and are later torn into more by lateral expansion of the thallus, whereas in all other Marchantiales forms, they arise in pairs—a fact of

possibly great theoretical significance. *Corsinia* gives us a step in advance in texture of the thallus. Here the upper part of the thallus shows well-developed air chambers bounded on all sides by plates of cells, below by the storage tissue and roofed in by an epidermal layer of cells; each chamber is open to the air by a simple pore. *Reboulia* shows much the same structure, but in *Fegatella* we meet a further advance in complexity. The air chambers here are very evident as in *Corsinia*, they open by a simple pore in just the same way but the space within the chamber is crowded with small columns of cells projecting into the cavity from its floor. These columns of cells are bathed by air and are packed with chlorophyll-bearing plastids. A still further advance is shown by *Preissia* and *Marchantia*. Here the thallus, air chambers and assimilating filaments are the same as in *Fegatella*, but the pores are very different. The pore in the epidermal roof of the air chamber takes the form of a small barrel with both ends open; the cells forming the sides, on occasions of drought, close the lower end of the barrel, which projects into the cavity (fig. 3).

**Marchantiales: Gametophyte.**—Alongside this progression in thallus complexity go other striking features. In *Riccia* the antheridia and archegonia are scattered irregularly over the upper surface of the thallus, sunk in the vertical columns of assimilating tissue, or if there is any sign of grouping of these reproductive organs it is very indefinite. *Corsinia* has separate male and female plants, and the male are very scarce and difficult to find even in a fruiting culture. The archegonia occur in groups and they come to lie in a saucer-shaped depression in the upper surface of the thallus. Furthermore, after an egg-cell is fertilized a small region of thallus tissue behind the archegonium grows rapidly and results in an irregular hood overhanging the sporogonium. This hood foreshadows a dominant feature of higher forms. In *Plagiochasma* we see a further advance. Both antheridia and archegonia are usually found in the same plant, the antheridia commonly formed first and appearing grouped together on small button-shaped masses of tissue along the dorsal surface of the thallus. The archegonia are also produced in compact groups, but here the portion of thallus bearing them grows up quickly and results in a stalked structure externally much like a miniature mushroom. This stalked mass of thallus tissue lifts up the archegonia which become displaced to the under edge of the cap and forms the

FROM "THE STUDENT'S HANDBOOK OF BRITISH HEPATICS"

FIG. 4.—GENERAL STRUCTURE OF THE PELLIA EPIPHYLLA, THE COMMONEST GENUS OF THE SIMPLE ANACROGYNÆ

structure we call an *archegoniophore* or more usually a *carpocephalum*. Here in *Plagiochasma* it arises on the dorsal surface behind the apex and is simply a dorsal outgrowth. In *Grimaldia* we have still further advance. A dorsal carpocephalum is formed as in *Plagiochasma*, but its formation stops the growth of the thallus apex and further growth is by a ventral branch. From this stage it is but a step to *Reboulia* where a carpocephalum is formed very much like *Plagiochasma*, but we find that there is a groove running up the stalk and branching in the cap, and that these grooves are packed with rhizoids. In short the apical cell

of the thallus has been utilized in the formation of the carpocephalum which is now a branch of the thallus and no longer a dorsal outgrowth. *Preissia* and *Marchantia*, especially the latter, reach the extreme development in this respect. Here the antheridia are borne on stalked apical structures, *antheridiophores*, the antheridia being embedded in the upper surface of the cap. Both antheridiophores and carpocephala have grooves packed with

FROM "THE STUDENT'S HANDBOOK OF BRITISH HEPATICS"

FIG. 5.—*BLASIA PUSILLA*, A LIVERWORT WHICH PRODUCES TWO TYPES OF GEMMAE, ONE OF WHICH GROWS INTO A NEW PLANT

rhizoids; they are branch structures and further growth of the thallus must be by ventral branch (fig. 3).

**Marchantiales: Sporophyte.**—The sporophyte generation increases in complexity along the same line. In *Riccia* the sporophyte is again in its simplest form, consisting of a spherical body which is just a single wall of sterile cells enclosing nothing but spores. This simple sporogonium is sunk in the tissue of the thallus and is surrounded by a double layer of cells, the calyptra, derived from the venter of the archegonium. Spore discharge is afforded by decay of gametophyte tissue and wall of sporogonium. In *Corsinia* the sporogonium is not sunk in the thallus tissue, and has, in addition to the *Riccia*-like structure of its sporogonium, sterile cells intermixed with the spores and a definite mass of sterile cells, the foot, attaching the sporogonium to the thallus. In higher forms the tendency to differentiation within the sporophyte generation reaches its fullest expression. The sporogonia are borne beneath the cap of the carpocephalum and all possess a foot, and in addition to spores have peculiar sterile cells. These nourish the developing spores and when mature are elongated and have one or two spiral bands of thickening laid down inside their walls. They are sensitive to moisture and are called *elaters*. We also find additional protection of the sporogonium. In most of them flap-like outgrowths of tissue, the *involute*, sheathe the young sporogonia whilst in *Marchantia* each sporogonium possesses a sleeve of tissue growing from the base of the archegonium—the *pseudoperianth*. Furthermore, we find that attempts are made at the formation of caps to the sporogonia which are cast off at the time of spore discharge.

It is thus possible to trace a serial progression in the genera of liverworts placed in the Marchantiales, the progression involving thallus, reproductive organs and sporogonia. The Marchantiales also afford us examples of vegetative or asexual reproduction. In the lower forms we seldom find definite structures set apart as asexual reproductive bodies though they are present here and there—generally any branch of the thallus may become detached by decay of older parts and thus lead to increase in number of plants. *Marchantia*, however, has definite buds, or *gemmae*, which are multicellular bodies, in shape much like the base of a fiddle, borne in large numbers in circular cups on the upper face of the thallus (fig. 3). Each gemma can reproduce a new plant. *Lunularia* has similar gemmae-cups, though these are semilunar in shape.

The *Jungermanniales* do not show such a neat progression in structure as the Marchantiales. They show progression from the

simple thalloid type towards the leafy habit and fall easily into two groups, the Anacrogynae and the Acrogynae.

**Anacrogynae.**—The Anacrogynae afford us the simplest types of the whole group. There is an absolute lack of tissue differentiation in all forms, but an obvious effort to differentiate in the thallus a rhizomatous portion and a specialized assimilating portion. The genus *Pellia* is at once perhaps the most common and certainly the simplest, if one omits *Sphaerocarpus* and *Riella* which cannot be here described. In *Pellia* (fig. 4) the thallus is just like that of the Marchantiales in outline but has no air pores, or chambers, and so appears perfectly smooth and green. No definite ventral scales are formed and no tuberculate rhizoids. These peculiar rhizoids are possessed only by the *Marchantiales*. The antheridia are spherical bodies borne scattered over the upper part of the thallus; the same thallus bears archegonia in groups behind the apex and protected by an involucre in the form of a shield of tissue growing up from behind and stretching forward as a little pocket over the archegonia. The sporogonium when mature consists of a basin-shaped foot embedded in the thallus and a long stalk or seta bearing a capsule. Within the wall of the capsule we find spores intermixed with elaters which in *Pellia* radiate from a column of sterile cells projecting into the capsule from the base, the *elaterophore*. As a well-developed sheath around the base of the seta may be seen the calyptra, the remains of the archegonium which developed after fertilization and through which the sporogonium burst as the seta elongated. At maturity the spores are discharged by a splitting of the wall of the capsule along four lines from the apex, resulting in four valves which curl back and expose the spores and elaters. With the exception of the elaterophore, the sporogonium of *Pellia* may be taken as typical of all the Jungermanniales, Anacrogynae and Acrogynae, for its structure is at once exceedingly uniform throughout the group and in sharp contrast with that of the Marchantiales. In the latter the stalked carpocephalum is gametophytic tissue whereas in the Jungermanniales the stalk which serves exactly the same purpose is sporophytic tissue.

From *Pellia* as a basal type we can trace in the Anacrogynae an attempt at the assumption of a leafy habit but it never reaches any high degree of organization. The apparent leafiness is rather a result of a more or less pronounced lobing of the thallus or a branching of the thallus. *Petalophyllum* and *Fossombronina* (fig. 6) give us the best attempt in this direction. Apart from this feature, the Anacrogynae are very uniform in structure; they differ in detail rather than in basic characters. Many forms possess methods of asexual reproduction highly developed. *Blasia pusilla* (fig. 5), a monospecific genus which very seldom forms sexual organs, is very striking in this respect. This plant produces two types of gemmae, one in the form of little scales which become detached and grow into a new plant, the other takes the form of multicellular gemmae produced in large numbers in beautiful "Florence flasks," formed near the apex of branches of the thallus. *Aneura* and some species of *Metzgeria* have a peculiar method of non-sexual reproduction, the cells of the thallus producing two non-motile gemmae in each cell, their liberation being by breakdown of the cell within which they arose.

FROM "THE STUDENT'S HANDBOOK OF BRITISH HEPATICS"

FIG. 6.—*FOSSOMBRONINA PUSILLA* IN WHICH THERE IS AN UNSUCCESSFUL ATTEMPT AT ASSUMING A LEAFY HABIT

The one fundamental fact in their organization which sharply distinguishes the Anacrogynae from the Acrogynae is that the apical cell is never involved in the formation of the archegonia; in other words the archegonia and sporogonia are never apical on main or lateral shoots, but always dorsal.

**Acrogynae.**—In the Acrogynae, though the antheridia are never apical, the archegonia always are so, on either main or lateral shoots. The apical cell is used in the formation of archegonia and further growth of the shoot is by a ventral branch. Again the Acrogynae, although including in their number quite 95%

of all known species of liverworts, are very uniform in plan, though differing in detail. They are all leafy types, commonly known as leafy or foliose liverworts. Their leaves are always definitely related to the divisions of the usual three-sided apical cell of the shoot and in their highest development occur in three rows. Of these three rows of leaves two different sets are recognizable. The Acrogynae are still dorsiventral in habit and two of the three rows of leaves occur in a dorsilateral position, exposed to the light, whilst the third row occurs on the ventral side of the shoot and its members are always smaller in size and usually different in shape from the other leaves. These distinct ventral leaves are called *amphigastria* (fig. 7). In some cases amphigastria are absent as in *Diplophyllum*, *Scapania* and some *Lejeunias*. The upper leaves are commonly more or less lobed, a two-pronged leaf being very common and their insertion on the stem is a point of importance. They may be inserted transversely with reference to the axis of the shoot; they may be obliquely inserted so that the edge of one leaf overlaps the edge of the next—if they overlap like the tiles of a roof they are said to be incubus, if the reverse they are succubus.

With regard to sexual organs, some Acrogynae are dioecious, some monoecious, sometimes they occur on special branches, sometimes not. The antheridia are never apical, they always occur in numbers along the stem, most commonly in the axils of leaves of the main shoots, in which case the leaves usually become hollow or hooded and protect them. The archegonia are sometimes on main shoots, sometimes on special shoots; in either case they always terminate the stem. The leaves near the archegonia are always modified and this modification extends often to three or four pairs of leaves—usually they become larger and simpler than the stem leaves and form the involucre. We often find in forms where amphigastria are normally absent that one is produced near the involucre. Very few cases are known where amphigastria are entirely absent (*Scapania*). Where they do occur on the stem, in the involucre they are often as large as the stem leaves themselves though usually simpler in form. Within the involucre we commonly find a tubular body, the *collesula* or *pseudoperianth* (fig. 7), which, though tubular in its origin and development, is referred to a coalescence of three leaves, the two dorso-lateral and the amphigastrium. Few families lack a collesula.

The sporogonia in the foliose liverworts are, apart from detail, much like those in the Anacrogynae, consisting of a foot, long seta

FROM "THE STUDENT'S HANDBOOK OF BRITISH HEPATICS"

FIG. 7.—*FRULLANIA DILATATA*, A GENUS OF THE ACOGYNAE, A GROUP WHICH INCLUDES 95% OF ALL KNOWN SPECIES OF LIVERWORT AND WHOSE MEMBERS ARE COMMONLY KNOWN AS LEAFY LIVERWORTS

and capsule opening by four slits from the apex and containing spores and elaters. A tendency widely spread has been the expansion of the foot as mentioned in *Pellia*. This prevalent expansion of the foot is connected with another feature shown by some of the foliose liverworts. The tissue around the foot becomes involved in the expansion and this ultimately resolves itself into the formation of a conspicuous pouch or *marsupium* which hangs down from the tip of the stem, has many rhizoids on its outer basal portion and within bears the archegonia and subsequently the foot of the sporogonium at the base of the pouch.

Many of the Acrogynae possess wonderful modifications in relation to water storage. *Trichocolea*, a genus found in sheets at the base of trees in wet tropical jungles, has leaves which are much branched and filamentous, reminding one of the dissected leaves

of ordinary water plants. Pouch formation by the leaves is very common. In *Frullania* (fig. 7) the ventral lobe of the leaf forms a beautiful pouch; in others, as in some *Lejeunias* and *Radulas* the two lobes of the leaf approach to form a cup. *Physiotium giganteum* has peculiar leaves the ventral lobe of which is just like a bottle, the dorsal lobe being hollowed out and leading directly into the orifice of the bottle. *Physiotium acinosum* has replaced leaf bottles by collesula bottles, which only rarely contain archegonia but are solely for water storage.

**Anthocerotales.**—The Anthocerotales, as mentioned previously, possess a simple thallus undifferentiated in either texture or habit, but are sharply separated from the remaining liverworts by reason of their sporogonium (fig. 8). There are very few genera in the group, the most noted being *Anthoceros*, *Dendroceros* and *Notothylas*. The thallus is dark green and its cells contain a single large chloroplast. On the under surface occur small slits filled with mucilage, which often also fills intercellular spaces in the thallus, and colonies of *Nostoc*, an alga, are constantly found inhabiting some of the mucilage slits. The group is specially noteworthy on account of its reproductive organs. Antheridia often occur in groups in chambers beneath the epidermis and are endogenous, in contrast to all other antheridia. The archegonia are superficial, but after fertilization become covered over by thallus growth and through this the sporogonium has to burst in its growth. The sporogonium

FIG. 9.—GENERAL STRUCTURE OF *SPHAGNUM ACUTIFOLIUM*, A PEAT MOSS, VERY ABSORBENT WHEN DRY, USED IN SURGICAL DRESSINGS

is a remarkable structure. It often reaches a length of an inch or more and consists of a wall several cells thick enclosing a spore sac and a sterile column of cells within, the columella. The spore sac overarches the columella, and besides spores, elaters of irregular shape are produced. The most peculiar feature, however, is that although there is no seta, a zone of tissue between the capsule and the foot remains actively growing and is adding new capsule tissues continuously from below during the life of the sporophyte. When mature, the capsule opens in two valves by splitting from the apex, and as spores are shed new ones are being added from

the base. Other features of interest are that the wall of the sporogonium contains stomata and chlorophyll and so can assimilate, and the foot buried in the thallus is irregular in outline. There are slight variations in details of structure between the few forms in this group, yet all are sufficiently peculiar in their structures to warrant the great interest they arouse.

### MUSCI

Musci or mosses, are on the whole more xerophytic (*i.e.*, suited to live under drier conditions) than liverworts and do not offer the same degree of variation in form and structure. All mosses consist of a distinct stem and leaves and almost all of them are radial in construction and not dorsiventral as are liverworts; in fact, apart from differences in smaller details all mosses are fundamentally the same in form (figs. 9, 10, 11). The stems have a single apical cell, the leaves, too, grow by a two-sided apical cell and do not show any trace of forking as was the case in the leafy liverworts. There is present the possibility of a good deal of differentiation in the tissues, for some mosses (*Polytrichum* for instance) reveal a structure almost analogous to the conducting strands of higher plants. The sexual organs, antheridia and archegonia, in mature form much like those of liverworts but differing in development, occur in groups at the apex of the main or lateral branches of the stem, with the exception of the antheridia of *Sphagnum*. They both occur in groups intermixed with peculiar hairs or paraphyses. The sporogonium developing from the fertilized egg has the usual capsule, stalk and foot, and is protected during its immature stages by the developing venter of the archegonium, the calyptra. As the sporogonium stalk elongates, the calyptra becomes torn, the upper half with the remains of the archegonium neck being carried up on top of the capsule, the lower half remaining as a frill round the base of the stalk. It is the sporogonium which at once clearly separates the mosses into three sub-groups, the Sphagnales and Andreaeales, both containing only a single genus, and the Bryales.

**Sphagnales.**—In the Sphagnales, with its single genus *Sphagnum*, the long stalk, the pseudopodium, bearing the capsule is not sporophytic but is a leafless prolongation of the axis of the gametophyte, embedded in the apex of which is the foot of the sporogonium (fig. 9). The seta is practically non-existent. The capsule consists of a wall a few cells thick enclosing a dome-shaped spore sac which overarches a sterile column of cells, the *columella*, which projects into the capsule from its base. Furthermore there is a lid or cap to the capsule, marked off by a ring of large cells, the *annulus*. This cap or *operculum* is thrown off at maturity by the activity of the cells of the annulus whereby the spore-sac is opened. There are no elaters in this or any other moss, and the spores in *Sphagnum* give rise to an unusual thalloid protonema. *Sphagnum* is a typical bog-forming moss and has leaves with very peculiar structure. These are one cell thick and consist of large, colourless empty cells open to the exterior by a pore, and surrounded by the comparatively small narrow chlorophyll-containing cells. The presence of these empty cells renders *Sphagnum* very absorbent, whence its use in surgical dressings.

In the Andreaeales, with its single genus *Andreaea* (fig. 10), again the sporogonium is borne aloft on a pseudopodium and the dome-shaped spore sac overarches the columella as in *Sphagnum*. Here, however, there is no operculum, the mature sporogonium opening by four slits down the side of the capsule.

FROM STRASBURGER, "TEXT-BOOK OF BOTANY"  
FIG. 10.—*ANDREAEA PETROPHILA*, ONLY GENUS OF THE MOSS GROUP ANDREALES SHOWN BEARING AN OPEN CAPSULE

**Bryales.**—The Bryales afford the most complicated structure of the sporophyte. Here the capsule is, with very few exceptions, borne on a long seta at whose base, sunk in the apex of the stem of the gametophyte, is the foot. The capsule is remarkable in many respects (fig. 11). The wall is several cells thick, and there is a well-defined operculum delimited by an annulus. Within the capsule running from base to apex is a sterile column of cells, the columella, which is surrounded by the cylindrical spore sac. Surrounding the spore sac is an air chamber, the spore sac being connected with the wall by means of strands of cells or trabeculae. The wall of the capsule possesses stomata and its cells contain chlorophyll, so that the sporophyte here can assimilate to some extent. At the apex of the seta, adjoining the capsule, is a region highly developed in some forms (*Splachnum luteum*) which has abundant air spaces and stomata in its epidermis, a region known as the apophysis. More remarkable, however, is the *peristome* of the capsule. This consists of one or two layers of small teeth attached to the wall of the capsule just beneath the annulus at one end, but free elsewhere. When the capsule is mature and the operculum thrown off, these teeth close the now hollow spore-containing capsule when conditions are moist and so retain the spores, but curl back in dry weather and allow their discharge.

This structure of the sporogonium is fairly uniform throughout the Bryales with the exception of the condition seen in the Polytrichaceae where peristome teeth are not developed, the capsule when mature having a ring of pores in place of the peristome. It is not necessary to stress the obvious fact that in the Bryales sporogonium we have a very highly organized structure.

Space does not permit even mention of the many points of theoretical interest in the Bryophyta, or many unusual but interesting forms to be met with. These questions, with others which add to the interest of the group, may be followed in the literature cited. The Bryophyta play their part in questions of broader interest. A few, for instance, act as "colonisers," they can gain a foothold on bare rock or other uncongenial places where higher plants fail, and in this way in course of time prepare a suitable groundwork for these higher forms. Many mosses and liverworts are epiphytic on the stems or leaves of other plants and it is interesting that many of them are very specific in their choice

FROM GOEBEL, "PFLANZENMORPHOLOGIE"

FIG. 11.—*FUNARIA HYGROMETRICA*, A MEMBER OF THE BRYALES, A GROUP WHICH CONTAINS THE MAJORITY OF THE MOSS GENERA of host. Therein lies an unsolved problem and there is need for careful recording of observations in this respect.

As to the origin of the Bryophyta as a whole, opinion is divided. We have little or no positive evidence from living or fossil forms, neither can we say definitely which of the higher groups of plants arose from them. Within themselves, as has been pointed out, they do show a serial progression, although instances of reduction are undoubtedly to be found. Such instances of reduction in structure have led some bryologists to look upon the simpler forms as derived from the higher by reduction, though this view is generally considered to be contrary to the mass of evidence Between the Hepaticae, Anthocerotales, Sphagnales and Bryales

there are no connecting forms known, and it must be left as an open question whether Bryophyta are a monophyletic group or not. With regard to the relationship between Bryophyta and Peridophyta the article on the latter group should be consulted. Although the alternating generations in the two are strictly comparable, no evidence of actual relationship is yet advanced.

For further information consult: Campbell, *Mosses and Ferns* (1895); Engler and Prantl, *Die natürlichen Pflanzenfamilien*, Teil I. Alt. 3 (Leipzig, 1909); Goebel, *Organography of Plants* (1900 and 1905); Cavers, "Inter-relationships of Bryophyta," *New Phytologist* (Reprint, Cambridge, 1911).

For identification of British species of liverworts and mosses:—Braithwaite, *British Moss Flora* (1887–1905); Pearson, *The Hepaticae of the British Isles* (1902); Dixon and Jameson, *The Student's Handbook of British Mosses* (1904); MacVicar, *The Student's Handbook of British Hepaticae* (Eastbourne and London, 1926). (F. How.)

**BRYOZOA**, a name, now obsolete, for the Polyzoa (*q.v.*).

**BRYTHONIC DIALECTS:** see INDO-EUROPEAN LANGUAGES AND CELTIC LANGUAGES.

**BRYUSOV, VALERY YAKOVLOVICH** (1873–1924), Russian poet, was born in Moscow Dec. 13, 1873, and died in the same town on Oct. 9, 1924. His early verses are decadent in style, but they brought him a certain notoriety. The influence of Balmont is seen in his earlier work, and of Verhaeren in his poems of the town and in his revolt against social evils, *e.g.*, *The Stonemason*. His later poems, however, are more scholarly and rhetorical in subject and style. He also wrote prose, his most interesting work being the historical novel, *The Flaming Angel* (1909), and was a great student of Pushkin. After the Oct. revolution in 1917 he joined the Communist party. His poetical works include: *Tertia Vigilia* (1901); *Urbi et Orbi* (1903); *Stephanos* (1905).

**BRZOWSKI, THADDEUS** (d. 1820), nineteenth general of the Jesuits, was appointed in succession to Gabriel Gruber on Sept. 2, 1805. In 1801 Pius VII. had given the Jesuits liberty to reconstitute themselves in north Russia (see *JESUITS: History*), and in 1812 Brzowski secured the recognition of the Jesuit college of Polotsk as a university, though he could not obtain permission to go to Spain to agitate for the recognition of the Spanish Jesuits. In 1814 Pius VII., in accordance with the bull *Sollicitudo omnium ecclesiarum*, gave to Brzowski among others full authority to receive those who desired to enter the society. The Russian government, however, on Dec. 20, 1815, published an edict expelling them from St. Petersburg. Brzowski died on Feb. 5, 1820.

**BUBASTIS**, an ancient city of Egypt, near the modern Zagazig; the Pa-Bast of the hieroglyphics, and the Pibeseth of the prophet Ezekiel. It is now a heap of mounds called Tell Basta, which were carefully excavated in 1886–87. The ancient city was probably built on made ground, over the level of the surrounding country. Remains were found, dating from as far back as the IVth. Dynasty, and Seti restored monuments in it which had been erected under the XVIIIth. Dynasty. His son Rameses II. is believed to have laid out a canal which ran from the Tanitic branch of the Nile here to the Bitter Lakes and the Gulf of Suez. In the period of decline about 1000 B.C., the descendant of a Libyan adventurer seized the title of Pharaoh and set up his throne here: this was Shashanq I., the Shishak of the books of Kings and Chronicles, and the founder of the XXIIInd. or Bubastite Dynasty. About 350 B.C. the city was captured by the Persians, and from the destruction which they inflicted it never recovered.

Bubastis is the Græcized name of the Egyptian goddess Ubasti, meaning "she of [the city] Bast" (*B'*, *s-t*), a city better known by its later name, P-ubasti, "place of Ubasti"; thus the goddess derived her name Ubasti from her city (Bast), and in turn the city derived its name P-ubasti from that of the goddess; the Greeks, confusing the name of the city with that of the goddess, called the latter Bubastis, and the former also Bubastis (later Bubastos).

Ubasti was one of many feline goddesses, figured with the head of a lioness. The domestic cat was especially the animal of Bubastis, although it had also to serve for all the other feline goddesses. Her hieratic and most general form was still lioness-headed, but a popular form, especially in bronze, was a cat-headed

woman, often holding in her right hand a lion aegis, *i.e.*, a broad semicircular pectoral surmounted by the head of a lioness, and on the left arm a basket. The cat cemetery on the west side of the town consisted of numbers of large brick chambers, crammed with burnt and decayed mummies, many of which had been enclosed in cat-shaped cases of wood and bronze. The festival of Bubastis was attended by thousands from all parts of Egypt and was a very riotous affair. There were two festivals of Bubastis, the great and the lesser: perhaps the lesser festival was held at Memphis, where the quarter called Ankhto contained a temple to this goddess. Her name is found on monuments from the 3rd dynasty onwards, but a great stimulus was given to her worship by the 22nd (Bubastite) dynasty and generally by the increased importance of Lower Egypt in later times. Her character seems to have been essentially mild and playful. The Greeks equated Ubasti with their Artemis, confusing her with the leonine Tafne, sister of Shōou (Apollo). The name of her son Iphthimis (Nfr-tm), pronounced Eftēm, may mean "All-good," and, in the absence of other information about him, suggests why he was identified with Prometheus.

**BUBONIC PLAGUE:** see PLAGUE.

**BUCARAMANGA**, a city of Colombia, capital of the department of Santander, about 185m. N.N.E. of Bogotá. Pop. in 1918, 24,919. It is situated on the Lebrija river, 2,850ft. above sea-level, in a mountainous country rich in gold, silver and iron mines, and having superior coffee-producing lands in the valleys. A railway is under construction from Puerto Wilches.

**BUCCANEERS**, the name given to a group of English, French, Dutch and Portuguese piratical adventurers united in their opposition to Spain, who maintained themselves chiefly in the Caribbean sea during the 17th century. They must not be confused with the earlier adventurers and privateers of whom Sir Francis Drake was an outstanding example, nor with the outlawed pirates of the 18th century.

By the early part of the 17th century the oppressive colonial policy of Spain had almost depopulated the island of Hispaniola, the modern Santo Domingo. Thinned of its former inhabitants, the island became the home of immense herds of wild cattle and pigs, and consequently an excellent place to provision the ships of smugglers. The natives still left were skilled in preserving flesh without the use of salt, an article both scarce and costly. The meat was cured in the sun and then smoked over a fire of green wood—a process termed "boucanning." The adventurers and smugglers, who were soon called buccaneers, learned boucanning from the natives; and gradually Hispaniola became the scene of an extensive and illicit provision trade. As the Spaniards would not recognize the right of other nations to make settlement, or even to trade in the West Indies, the Governments of France, England and Holland would do nothing to control their subjects who invaded the islands. Out of such conditions arose the buccaneer, alternately sailor and hunter, even occasionally a planter—roving, bold, unscrupulous, often savage, with an intense detestation of Spain.

**Early Settlements.**—Both England and France contributed bands of colonists for a settlement made on the island of St. Kitts or St. Christopher, in the West Indies. The English and French were, however, not very friendly; and in 1629, after the retirement of several of the English to an adjoining island, the remaining colonists were surprised and partly dispersed by the arrival of a Spanish fleet. But on the departure of the fleet the scattered bands returned, and were soon of sufficient strength to give assistance to their countrymen in Santo Domingo. As buccaneering had developed into a profitable employment, it was thought expedient to build a storehouse secure from the attack of the Spaniards. The small island of Tortuga was seized for this purpose in 1630, and converted into a magazine for the goods of the smugglers, Santo Domingo still continuing their hunting ground. A purely English settlement directed by a company in London was made (1630) at Old Providence, an island in the Caribbean sea, but it was suppressed by the Spaniards in 1641. About the same time, the Spaniards attacked Tortuga and massacred every settler they could seize. The few who escaped returned, and the buccaneers, now in open hostility to the Spanish arms, began to receive re-

cruits from every European trading nation, and for three-quarters of a century became the scourge of the Spanish-American trade and dominions. This roving community had to maintain itself as best it could—now mainly on the sea. However, in 1655 fortune turned their way when, with their assistance, the navy of the English Commonwealth succeeded in capturing the island of Jamaica. Its ample harbours, for many years, furnished the buccaneers with havens in their operations against the Spaniards.

Their history now divides itself into three epochs. The first extends from the period of their rise to the capture of Panama by Morgan in 1671, during which time they were hampered neither by Government aid nor, till near its close, by Government restriction. The second, from 1671 to the time of their greatest power, 1685, when the scene of their operations was no longer merely the Caribbean, but principally the whole range of the Pacific from California to Chile. The third and last period extends from that year onwards; it was a time of disunion and disintegration, when the independence and rude honour of the previous periods had degenerated into vice and brutality.

**The Period of Henry Morgan.**—It is chiefly during the first period that those leaders flourished whose names and doings have been associated with all that was really influential in the exploits of the buccaneers—the most prominent being Mansfield and Morgan. In 1654 the first great expedition on land made by the buccaneers, though attended by considerable difficulties, was completed by the capture and sack of New Segovia, on the mainland of America. The Gulf of Venezuela, with its towns of Maracaibo and Gibraltar, were attacked and plundered under the command of a Frenchman named L'Ollonois, who performed, it is said, the office of executioner upon the whole crew of a Spanish vessel manned with 90 seamen. Such successes removed the buccaneers further and further from the pale of civilized society. Mansfield, in 1664, conceived the idea of a permanent settlement upon a small island of the Bahamas, named New Providence, and Henry Morgan, a Welshman, intrepid and unscrupulous, joined him. But the untimely death of Mansfield nipped in the bud the only rational scheme of settlement which seems to have animated this wild community at any time; and Morgan, now elected commander, swept the whole Caribbean, and from his headquarters in Jamaica led triumphant expeditions to Cuba and the mainland. He was leader of the expedition which surprised and plundered Porto Bello, one of the best-fortified ports in the West Indies.

This was too much for even the adverse European powers; and in 1670 a treaty was concluded between England and Spain, proclaiming peace and friendship among the subjects of the two sovereigns in the New World. The treaty was very ill observed in Jamaica, where the governor, Thomas Modyford (1620–79), was in close alliance with the "privateers," which was the official title of the buccaneers. He had already granted commissions to Morgan and others for a great attack on the Isthmus of Panama, the route by which the bullion of the South American mines was carried to Porto Bello, to be shipped to Spain. The buccaneers to the number of 2,000 began by seizing Chagres, and then marched to Panama in 1671. The city was taken, and, accidentally or not, it was burnt; but the Spaniards had removed the treasure, the booty was small, and many died of starvation on the way back to Jamaica. Modyford was recalled, and in 1672 Morgan was called home and imprisoned in the Tower. In 1674 he was allowed to return to the island as lieutenant-governor with Lord Vaughan. During his later years he was active in suppressing the buccaneers who now had inconvenient claims on him.

**On the Pacific.**—From 1671 to 1685 was the time of the great daring, prosperity and power of the buccaneers. Notwithstanding their many successes in the Caribbean and on land, they pictured the South sea as a far wider and more lucrative field for the display of their united power. In 1680 a body of marauders over 300 strong, well armed and provisioned, landed on the shore of Darien and struck across the country to the Pacific. With John Coxon as commander they entered the Bay of Panama, where the Spaniards had hastily prepared a small fleet to meet them. But the valour of the buccaneers won for them another victory; within a week they took possession of four Spanish ships, and now successes

flowed upon them. Coxon and 70 men returned as they had gone, but the others, under Sawkins, Sharp and Watling, roamed north and south on islands and mainland, and remained for long ravaging the coast of Peru. Again, in 1683, numbers of them under John Cook departed for the South sea by way of Cape Horn. On Cook's death his successor, Edward Davis, undoubtedly the greatest and most prudent commander who ever led the forces of the buccaneers at sea, met with a certain Captain Swan from England, and the two began a cruise which was disastrous to the Spanish trade in the Pacific. In 1685 they were joined in the Bay of Panama by large numbers of buccaneers who had crossed the isthmus under Townley and others. At this period the power of the buccaneers was at its height. But the combination was too extensive for its work, and the different nationality of those who composed it was a source of growing discord.

**The Final Epoch.**—The separation of the English and French buccaneers, who together presented a united front to the Spanish fleet in 1685, marks the beginning of the third and last epoch in their history. They hung doggedly along the coasts of Jamaica and Santo Domingo, but their day was nearly over. Only once again—at the siege of Carthagena—did they appear great; but even then the expedition was not of their making, and they were mere auxiliaries of the French regular forces. The French and English buccaneers could not but take sides in the war which had arisen between their respective countries in 1689. Thus was broken the bond of unity which had for three-quarters of a century kept the subjects of the two nations together in schemes of aggression upon a common foe.

The importance of the buccaneers in history lies in the fact that they opened the eyes of the world to the whole system of Spanish-American Government and commerce—the former in its rottenness, and the latter in its possibilities in other hands. From this, then, along with other causes, dating primarily from the helplessness and presumption of Spain, there arose the West Indian possessions of Holland, England and France.

A work published at Amsterdam in 1678, entitled *De Americainsche Zee Roovers*, from the pen of a buccaneer named Exquemelin, was translated into several European languages, receiving additions at the hands of the different translators. The English edition is entitled *The Buccaneers of America*. Other works are Raynal's *History of the Settlements and Trade of the Europeans in the East and West Indies*, book x., English translation 1782; Dampier's *Voyages*; and L. Wafer, *Voyage and Description of the Isthmus of America* (1699). A reliable narrative is Capt. James Burney's *History of the Buccaneers of America* (1816). The *Calendar of State Papers, Colonial Series* (London, 1860 *et seq.*), contains much evidence for the history of the buccaneers in the West Indies. Popular works are J. Masfield, *On the Spanish Main* (1906) and A. H. Verrill, *In the Wake of the Buccaneers* (1923).

**BUCCARI** (Serbo-Croatian *Bakar*), a town of Yugoslavia on a small bay of the Adriatic Sea. Pop. (1921) 2,405. The railway from Zagreb to Fiume terminates 2½ m. from Buccari. The harbour, though sometimes dangerous to approach, owing to the dreaded bora, or northeast wind, affords good anchorage to small

AFTER A PHOTO BY BROGI  
THE BUCCINA, USED IN  
THE ROMAN ARMY TO  
SOUND NIGHT WATCHES

vessels, but competition from Fiume destroyed most of its trade during the 19th century. There is a naval academy in the town with over 200 pupils. The staple industry is boat-building, but there is an active coasting trade in wine, wood, coal and fish, the tunny fishery being of some importance. The old castle of Buccarica is not far off, and further south is the flourishing little port of Porto Ré or Kraljevica.

**BUCCINA**, a brass wind instrument extensively used in the ancient Roman army. It consisted of a brass tube bent into the shape of a broad C, measuring some 11 to 12 ft. in length, of narrow cylindrical bore, and played by means of a cup-shaped mouthpiece. After the fall of the Roman empire the art of bending metal tubes was gradually lost, and although the buccina survived in Europe both in name and in principle of construction during the middle ages, it lost its characteristic curved form. Although we regard the buccina as essentially Roman, an instrument

of the same type and of kindred name, but probably straight, was widely known and used in Persia, Arabia, and among the Semitic races. After a lapse of years during which records are almost wanting, the buccina reappeared all over Europe as the busine, buisine, pusin, busaun, pusun, posaun, busna (Slav), etc.; but whether it was a Roman survival, or a re-introduction through the Moors of Spain in the West, and the Byzantine empire in the East, there are no records to show.

The history of the development of the trumpet, the sackbut, and the trombone from the buccina will be found more fully treated under those headings.

**BUCCLEUCH, DUKES OF.** The substantial origin of the ducal house of the Scotts of Buccleuch dates back to the large grants of land in Scotland to Sir Walter Scott of Kirkcudbright and Buccleuch, a border chief, by James II., in consequence of the fall of the 8th earl of Douglas (1452); but the family traced their descent back to a Sir Richard le Scott (1249-85). The estate of Buccleuch is in Selkirkshire. Sir Walter Scott of Branxholm and Buccleuch (died 1552) distinguished himself at the battle of Pinkie (1547), and furnished material for his later namesake's famous poem, *The Lay of the Last Minstrel*; and his great-grandson Sir Walter (1565-1611) was created Lord Scott of Buccleuch in 1606. An earldom followed in 1619. The second earl's daughter Anne (1651-1732), who succeeded him as a countess in her own right, married in 1663 the famous duke of Monmouth (*q.v.*), who was then created 1st duke of Buccleuch; and her grandson Francis became 2nd duke. The latter's son Henry (1746-1812) became 3rd duke, and in 1810 succeeded also, on the death of William Douglas, 4th duke of Queensberry, to that dukedom as well as its estates and other honours, according to the entail executed by his own great-grandfather, the 2nd duke of Queensberry, in 1706. John Charles Montagu-Douglas-Scott, 7th duke of Buccleuch, duke of Queensberry, etc., son of the 6th duke whose wife was well known as mistress of the robes to Queen Victoria, succeeded to the title in 1914.

See Sir W. Fraser, *The Scotts of Buccleuch* (1878).

**BUCENTAUR**, the State galley of the doges of Venice, on which, every year on Ascension day up to 1789, they put into the Adriatic in order to perform the ceremony of "wedding the sea." The name *bucintoro* is derived from the Ital. *buzino d'oro*, "golden bark," and seems to have been given to any sumptuous Venetian galley. The last and most magnificent of the bucentaurs, built in 1729, was destroyed by the French in 1798 for the sake of its golden decorations. Remains of it are preserved at Venice in the Museo Civico Correr and in the Arsenal.

The "Marriage of the Adriatic," or more correctly "of the sea" (*Sposalizio del Mar*) was a ceremony symbolizing the maritime dominion of Venice, established about A.D. 1000 to commemorate the doge Orseolo II.'s conquest of Dalmatia. The form it took was a solemn procession of boats, headed by the doge's *maesta nave*, afterwards the Bucentaur (from 1311), out to sea by the Lido port. To this ancient ceremony a sacramental character was given by Pope Alexander III. in 1177, in return for the services rendered by Venice in the struggle against the emperor Frederick I. The pope drew a ring from his finger and, giving it to the doge, bade him cast such a one into the sea each year on Ascension day, and so wed the sea. Henceforth the ceremonial, instead of placatory and expiatory, became nuptial. Every year the doge dropped a consecrated ring into the sea and with the words *Desponsamus te, mare* (We wed thee, sea) declared Venice and the sea to be indissolubly one.

**BUCEPHALUS**, the favourite Thracian horse of Alexander the Great (Gr. *Βουκέφαλος*), which died in 326 B.C. In commemoration Alexander built the city of Bucephala, whose site may be identified with a mound opposite the modern Jhelum.

**BIBLIOGRAPHY.**—See especially Arrian v. 20; other stories in Plutarch, *Alex.*, 6; Curtius vi. 8. For the identification of Bucephala, see Vincent A. Smith, *Early Hist. of India*, p. 65, 66 note (2nd ed., 1908).

**BUCER** (or **BUTZER**), **MARTIN** (1491-1551), German Protestant reformer, was born at Schlettstadt in Alsace. In 1506 he entered the Dominican order, and was sent to study at Heidelberg. There he became acquainted with the works of Erasmus

and Luther, and was present at a disputation of the latter on the doctrine of free will. Withdrawing from his order in 1521, Bucer entered the service of the Elector Palatine, but in 1522 became pastor of Landstuhl where he married Elizabeth Silbereisen, a former nun. After his excommunication in 1523 he made his headquarters at Strasbourg. On the question of the Eucharist, Bucer's opinions in some degree approached the Zwinglian position, but he was anxious to secure unity with the Lutheran party and constantly endeavoured, especially after Zwingli's death (1531), to find a compromise that would unite Lutheran, south German and Swiss reformers. Hence the charge of ambiguity and obscurity which has been laid against him. In 1529 he had succeeded in arranging a conference at Marburg between Luther and Zwingli, but no agreement was reached on the main question. He helped to draft the declaration known as the *Confessio Tetrapolitana*, presented to the Diet of Augsburg in 1530 by the towns of Strasbourg, Memmingen, Constance and Lindau. He met Luther at Coburg in 1530, and Melancthon at Cassel in 1534, but agreement on the question of the real presence in the Eucharist was reached only when he met Luther at Wittenberg in May 1536. But even so agreement was rather apparent than real, for Bucer had gone farther than the Swiss were prepared to go. He then sought in vain to arrange an understanding between the Catholics and the Reformers. In 1548 he was sent to Augsburg to sign the agreement, called the *Interim*, between the Catholics and Protestants. His stout opposition to this project exposed him to many difficulties; Strasbourg was almost alone in declining assent, and eventually he had to seek leave of absence, gladly accepting Cranmer's invitation to make his home in England. On his arrival in 1549 he was appointed regius professor of divinity at Cambridge. Edward VI. and the protector Somerset showed him much favour and he was consulted as to the revision of the Book of Common Prayer. Bucer died on Feb. 27, 1551. His name is familiar in English literature from the use made of his doctrines by Milton in his divorce treatises.

**BIBLIOGRAPHY.**—A collected edition of his writings has never been published. A volume known as the *Scripta Anglicana* or *Tomus Anglicanus* (Basle, 1577) contains those written in England. His correspondence with Philip of Hesse, whose "second" marriage, accepted by the reformers, created a scandal, was edited by Lenz (1880-91). See J. W. Baum, *Capito and Butzer* (Strasbourg, 1860), which contains in an appendix a full list of his work; J. Ficker, *Martin Bucer* (1917); A. Erickson, *Zur 400-Jährigen Geburtsfeier Martin Butzers* (Strassburg, 1891), and the articles in the *Dict. Nat. Biog.* (by A. W. Ward), and in Herzog-Hauck's *Realencyklopädie* (by Paul Grünberg).

**BUCEROTIDAE:** see **HORNBILL**.

**BUCH, CHRISTIAN LEOPOLD VON**, BARON (1774-1853), German geologist and geographer, a member of an ancient and noble Prussian family, was born at Stolpe in Pomerania on April 26 1774. In 1790-93 he studied at the mining school of Freiberg under Werner, one of his fellow-students there being Alexander von Humboldt. He completed his education at the universities of Halle and Göttingen. In 1797 he met Humboldt at Salzburg, and with him explored the geological formations of Styria and the adjoining Alps. A visit to Italy in 1798 shook his faith in the Neptunian theory. In 1799 he paid his first visit to Vesuvius, and again in 1805 he returned to study the volcano, accompanied by Humboldt and Gay Lussac, when they witnessed an eruption which supplied von Buch with data for refuting many erroneous ideas then entertained regarding volcanoes. In 1802 he had explored the extinct volcanoes of Auvergne. The scientific results of his investigations he embodied in his *Geognostische Beobachtungen auf Reisen durch Deutschland und Italien* (Berlin, 1802-09). Von Buch spent two years among the Scandinavian islands; he showed that many of the erratic blocks on the North German plains must have come from Scandinavia. He also established the fact that the whole of Sweden is slowly but continuously rising above the level of the sea from Frederikshald to Abo. The details of these discoveries are given in his *Reise durch Norwegen und Lappland* (Berlin, 1810). In 1815 he visited the Canary islands in company with Christian Smith, the Norwegian botanist. The physical description of the Canary islands was published at Berlin in 1825. After leaving the

Canaries, von Buch proceeded to the Hebrides and the coasts of Scotland and Ireland. He published in 1832 the magnificent *Geological Map of Germany* (42 sheets, Berlin). His geological excursions were continued without interruption till his 78th year. He died at Berlin on March 4, 1853. Humboldt pronounced him the greatest geologist of his time.

A complete edition of his works was published at Berlin (1867-85), edited by Ewald and others.

**BUCHAN, EARLS OF.** The earldom of Mar and Buchan was one of the seven original Scottish earldoms; later, Buchan was separated from Mar, and among the early earls of Buchan were Alexander Comyn (d. 1289), John Comyn (d. c. 1313), both constables of Scotland, and Henry Beaumont (d. 1340), who had married a Comyn. John Comyn's wife, Isabel, was the countess of Buchan who crowned Robert the Bruce king at Scone in 1306, and was afterwards imprisoned at Berwick; not, however, in a cage hung on the wall of the castle. About 1382 Sir Alexander Stewart (d. c. 1404), the "wolf of Badenoch," a son of King Robert II., became earl of Buchan, and the Stewarts appear to have held the earldom for about a century and a half, although not in a direct line from Sir Alexander. Among the most celebrated of the Stewart earls were the Scottish regent, Robert, duke of Albany, and his son John, who was made constable of France and was killed at the battle of Verneuil in 1424. In 1617 the earldom came to James Erskine (d. 1640), a son of John Erskine, 2nd (or 7th) earl of Mar, whose wife Mary had inherited it from her father, James Douglas (d. 1601), and from that time it has been retained by the Erskines.

Perhaps the most celebrated of the later earls of Buchan was the eccentric David Steuart Erskine, 11th earl (1742-1829), a son of Henry David, 10th earl (d. 1767), and brother of Henry Erskine (q.v.), and of Thomas, Lord Erskine (q.v.). His pertinacity was instrumental in effecting a change in the method of electing Scottish representative peers, and in 1780 he succeeded in founding the Scottish Society of Antiquaries. Among his correspondents was Horace Walpole, and he wrote an *Essay on the Lives of Fletcher of Saltoun and the Poet Thomson* (1792), and other writings. He died at his residence at Dryburgh in April 1829, leaving no legitimate children, and was followed as 12th earl by his nephew Henry David (1783-1857), the ancestor of the present peer. The 11th earl's natural son, Sir David Erskine (1772-1837), who inherited his father's unentailed estates, was an antiquary and a dramatist.

**BUCHAN, ELSPETH** (1738-1791), founder of a Scottish religious sect known as the Buchanites, the daughter of a Banffshire innkeeper. Having quarrelled with her husband, Robert Buchan, a potter of Greenock, she settled with her children in Glasgow, where she persuaded a small group of people that she was a saint with a special mission, that in fact she was the woman described in Revelation xii. Her sect, which ultimately numbered 46 adherents, was expelled by the magistrates in 1784 and settled in a farmhouse, consisting of one room and a loft, known as New Cample in Dumfriesshire. Robert Burns, the poet, in a letter dated Aug. 1784, describes the sect, which broke up on the death of its founder, as idle and immoral.

See J. Train, *The Buchanites from First to Last* (Edinburgh, 1846).

**BUCHAN, JOHN** (1875- ), British author, was born at Perth, Scotland, Aug. 26 1875. Educated at Glasgow university and Brasenose college, Oxford, he was called to the bar at the Middle Temple in 1901. In the same year he became private secretary to Lord Milner, then high commissioner for South Africa. In 1903 he returned to England, and soon became a member of the publishing firm of Thomas Nelson and Sons, Edinburgh. During the World War he served on the staff at British headquarters, and in 1917 became director of information under Mr. Lloyd George. He became member of parliament for the Scottish Universities in 1927. As a novelist Buchan is best known for his brilliant tales of adventure, such as *John Burnet of Barns* (1898); *Prestor John* (1910); *The Thirty-Nine Steps* (1915); *Greenmantle* (1916); *Mr. Standfast* (1919); *Midwinter* (1923); and *John Macnab* (1925). He wrote various historical studies and a popular *History of the Great War*.

**BUCHAN, PETER** (1790-1854), Scottish editor, was born at Peterhead, Aberdeenshire, and started in business as a printer there in 1816. His *Ancient Ballads and Songs of the North of Scotland* (1828), contained a large number of hitherto unpublished ballads and newly discovered versions of existing ones. Another collection made by him was published by the Percy Society, under the title *Scottish Traditional Versions of Ancient Ballads* (1845). Two unpublished volumes of Buchan's ballad collections are in the British Museum. He died on Sept. 19, 1854.

See *Peter Buchan, etc.*, by W. Walker (1915).

**BUCHANAN, CLAUDIUS** (1766-1815), English divine, was born at Cambuslang, near Glasgow, and educated at the universities of Glasgow and Cambridge. He was ordained in 1795, and after holding a chaplaincy in India at Barrackpur (1797-99) was appointed Calcutta chaplain and vice-principal of the college of Fort William. He translated the gospels into Persian and Hindustani. After his return to England in 1808, he aroused public opinion on the missionary question, and by his book *Colonial Ecclesiastical Establishment* (London, 1813), he helped on the establishment of the Indian episcopate and the first English bishop of Calcutta was appointed. He died on Feb. 9, 1815.

**BUCHANAN, GEORGE** (1506-1582), the greatest of the Scottish humanists of the 16th century, was born at Killearn, Stirlingshire, in Feb. 1506. He had already spent two years as a student at Paris, and had served in a strenuous campaign with Albany's French troops in Scotland when he heard the lectures of John Mair or Major at Aberdeen in 1524. Mair took him to Paris next year. Buchanan lived the hard life of the Paris student of those days, and after concluding his course stayed on in Paris and the neighbourhood until 1536. To this period belongs his *Somnium*, directed against the Franciscans. After his return to Scotland the king asked him to satirize the friars, and there is no doubt that his *Franciscanus et Fratres* helped on the Reformation. But James was not prepared to defend the satirist against the clergy and Cardinal Beaton procured Buchanan's imprisonment. He escaped to Bordeaux, where he taught Latin for three years; there he composed his four tragedies, *Baptistes*, *Medea*, *Jephthes* and *Alcestis*, to be acted by the students, among whom was Montaigne, who always kept a kindly feeling for his tutor. At this period he also wrote many amatory Latin verses. He returned to Paris in the late '40s and then to Coimbra in Portugal, to be head of the newly established college. But the report of his attacks on the Franciscans had preceded him, and he was again imprisoned, this time in a monastery, in the hope that he might be reclaimed for orthodoxy. He occupied his enforced leisure by preparing a Latin verse translation of the Psalms. After his release he visited Scotland, but soon returned to Paris. It is almost certain that during this last stay in France, Buchanan ranged himself definitely on the side of the Calvinists.

In 1560 or 1561 he returned to Scotland, and in April 1562 was installed as tutor to the young Queen Mary. Buchanan then openly joined the Reformed Church, and in 1566 was appointed by the earl of Moray principal of St. Leonard's college, St. Andrews. His great reputation for learning and administrative capacity led to his appointment as moderator of the general assembly in 1567. He had sat in the assemblies from 1563. Buchanan accompanied Moray to England as secretary to the commission which was to meet the English commissioners at York on the business of the guilt of Mary, Queen of Scots. Part of the Casket Letters (q.v.) were exhibited at this meeting, and Buchanan declared, with Lethington, that they were in Mary's handwriting. The conference was then transferred to Westminster. Accusations were afterwards brought against Buchanan of having forged the documents found in the casket. Of this there is no proof, and the charge is inherently improbable, but it must be admitted that Buchanan was a willing agent in Moray's disingenuous handling of the case against the queen. Buchanan's *Detectio*, printed in Latin in 1571, was based on the Book of Articles handed in by Moray to the conference in Dec. 1568, in which the charges against Mary were first formulated. When the work was brought to Mary's notice she justly described it as a "defamatory book," and remarked that she had expressly

desired that he should not be near her son. Buchanan had been appointed one of the preceptors of the young king James VI. in 1570. He was director of chancery, and then became lord privy seal, a post entitling him to a seat in the parliament, which he held at least till 1579. He died on Sept. 28, 1582.

His last years had been occupied with two of his most important works. In the *De Jure Regni apud Scotos* (1579) Buchanan lays down the doctrine that the source of political power is the people, that the king is bound by those conditions under which the supreme power was first committed to his hands, and that it is lawful to resist, even to punish, tyrants. This work was condemned by Act of parliament in 1584, and again in 1664; and in 1683 it was burned by the University of Oxford. His history of Scotland, *Rerum Scotticarum Historia*, was completed in 1579 and published in 1582. Buchanan's purpose was to "purge" the national history "of sum Inglis lysis and Scottis vanite" (*Letter to Randolph*), but he exaggerated his freedom from partisanship.

Buchanan wrote Latin as if it had been his mother tongue. His translations are more than versions; the smaller satirical poems abound in wit and in happy phrase; his two tragedies, *Baptistes* and *Jepthes*, have an undiminished European reputation for academic excellence. In addition to the works already named, Buchanan wrote in prose *Chamaeleon*, a satire in the vernacular against Maitland of Lethington, first printed in 1711; a Latin translation of Linacre's Grammar (Paris, 1533); *Libellus de Prosodia* (Edinburgh, 1640); and *Vita ab ipso scripta biennio ante mortem* (1608), ed. by R. Sibbald (1702). Other poems are *Fratres Fraterrimi*, *Elegiae*, *Silvae*, two sets of verses entitled *Hendecasyllabon Liber* and *Iambon Liber*; three books of *Epigrammata*; a book of miscellaneous verse; *De Sphaera* (in five books), suggested by the work of Joannes de Sacrobosco, and intended as a defence of the Ptolemaic theory against the new Copernican view.

Buchanan's works were edited by Ruddiman (1715) and by Burman (1725). The *Vernacular Writings*, consisting of the *Chamaeleon* (u.s.), a tract on the Reformation of St. Andrews university, *Ane admonition to the Trew Lordis*, and two letters, were edited for the Scottish Text Society by P. Hume Brown. The principal biographies are: David Irving, *Memoirs of the Life and Writings of George Buchanan* (1807 and 1817); P. Hume Brown, *George Buchanan, Humanist and Reformer* (1890) and *George Buchanan and his Times* (1906); Rev. D. Macmillan, *George Buchanan, a Biography* (1906). Buchanan's quatercentenary was celebrated at different centres in Scotland in 1906, and was the occasion of several encomia and studies. A verse translation of the *Baptistes*, entitled *Tyrannicall-Government Anatomized* (1642), has been attributed to Milton; its authorship is discussed in the *Glasgow Quatercentenary Studies* (1906). The records of Buchanan's trial, discovered by the Portuguese historian, G. J. C. Henriques, were published by him under the title *George Buchanan in the Lisbon Inquisition. The Records of his Trial, etc.* (1906). On the *Detectio*, see R. H. Mahon, *The Indictment of Mary Queen of Scots*.

**BUCHANAN, JAMES** (1791-1868), fifteenth president of the United States, was born near Foltz, Franklin county, Pa., on April 23, 1791. Both parents were of Scottish-Irish Presbyterian descent. He graduated at Dickinson college, Carlisle, Pa., in 1809 and studied law at Lancaster for two years. He was admitted to the bar in 1812 and served in the lower house of the State legislature, 1814-16. From 1821 to 1831 he was a representative in Congress where as chairman of the judiciary committee he conducted the impeachment trial (1830) of Judge James H. Peck, led an unsuccessful movement to increase the number of Supreme Court judges and to relieve them of their circuit duties, and succeeded in defeating an attempt to repeal the 25th section of the Judiciary Act of 1789, which gave the Supreme Court appellate jurisdiction by writ of error to the State courts in cases where Federal laws and treaties were in question. After the dissolution of the Federalist Party, of which he had been a member, he came to be definitely associated with the Democrats. He represented the United States at the court of St. Petersburg from 1832 to 1833 and there negotiated an important commercial treaty. He was a Democratic member of the U.S. Senate from Dec. 1834 until March 1845, ardently supporting President Jackson, and was secretary of State in the cabinet of President Polk from 1845 to 1849—a period marked by the annexation of Texas, the Mexican

War and negotiations with Great Britain relative to the Oregon question. After four years of retirement, following his failure to secure the Democratic nomination for president, he was appointed by President Pierce minister to Great Britain in 1853. By this time Buchanan had changed his attitude of 1819 on the slavery question. He felt that the institution was morally wrong, but held that Congress could not interfere with it in the States in which it existed, and ought not to hinder the natural tendency toward territorial expansion through a fear that the evil would spread. He voted for the bill to exclude anti-slavery literature from the mails and for the Compromise of 1850 and disapproved of the Wilmot Proviso. Fortunately for his career he was abroad during the Kansas-Nebraska debates, hence did not share in the unpopularity which attached to Stephen A. Douglas as the author of the bill and to President Pierce as the executive who was called upon to enforce it. At the same time, by joining with J. Y. Mason and Pierre Soulé in issuing the Ostend Manifesto in 1854, he retained the good will of the South. This "manifesto" which was bitterly attacked in the North, was agreed upon (Oct. 18, 1854) by the three ministers after several meetings at Ostend and at Aix-la-Chapelle, arranged in pursuance of instructions to them from President Pierce to "compare opinions, and to adopt measures for perfect concert of action in aid of the negotiations at Madrid" on the subject of reparations demanded from Spain by the United States for alleged injuries to American commerce with Cuba. In the manifesto the three ministers asserted that "from the peculiarity of its geographical position, and the considerations attendant upon it, Cuba is as necessary to the North American republic as any of its present members"; spoke of the danger to the United States of an insurrection in Cuba; asserted that "we should be recreant to our duty, be unworthy of our gallant forefathers, and commit base treason against our posterity, should we permit Cuba to be Africanized"; and recommended that "the United States ought, if practicable, to purchase Cuba as soon as possible." The most startling declaration of the manifesto was that if Spain should refuse to sell "after we shall have offered a price for Cuba far beyond its present value," and if Cuba, in the possession of Spain, should seriously endanger "our internal peace and the existence of our cherished Union," then "by every law, human and divine, we shall be justified in wresting it from Spain if we have the power."

On his return from England in 1856 he was nominated by the Democrats as a compromise candidate for president and was elected, receiving 174 electoral votes to 114 for J. C. Frémont, Republican, and 8 for Millard Fillmore, American or "Know-Nothing." Buchanan's character, the breadth of his legal knowledge, and his experience as congressman, cabinet member and diplomat, would have made him an excellent president in ordinary times; but he lacked the soundness of judgment, the self-reliance and the moral courage needed to face the slavery crisis. His idea of saving the Union was to prevent Northern agitation and to enforce the fugitive slave law. At the beginning of his administration he appointed Robert J. Walker, of Mississippi, Territorial governor of Kansas, and Frederick P. Stanton, of Tennessee, secretary, and assured them of his determination to adhere to the popular sovereignty principle, but soon began to use his influence to force the admission of Kansas into the Union under the pro-slavery Lecompton constitution, contrary to the wishes of the majority of the settlers. Stanton was removed from office for opposing the scheme, and Walker resigned in disgust. This change of policy was doubtless the result of timidity and his inability to realize the strength and determination of the Abolitionists; after every slavery crisis he considered the issue settled. Under the influence of Howell Cobb of Georgia, secretary of the Treasury, and Jacob Thompson, of Mississippi, secretary of the interior, the president was convinced that his action was the only way to avoid civil war. Federal patronage was freely used to advance the Lecompton measure and the compromise English bill, and to prevent Douglas's election to the Senate in 1858. Some of these facts were brought out in the famous but partisan and possibly unconstitutional Covode investigation conducted by a committee of the House of Representatives in 1860.

The call issued by the South Carolina legislature just after the election of Lincoln for a State convention to decide upon the advisability of secession brought forward the most serious matter in Buchanan's administration. The part of his annual message of Dec. 4, 1860, dealing with it, argued that a State had no legal right to secede, but denied that the Federal Government had any power forcibly to prevent it. At the same time it was the duty of the president to call out the army and navy of the United States to protect Federal property and to enforce Federal laws. Soon after the secession movement began the Southern members of the cabinet resigned, and the president gradually came under the influence of Black, Stanton, Dix and other Northern leaders but continued to work for a peaceful settlement, supporting the Crittenden Compromise and the work of the Peace Congress. He disapproved of Major Anderson's removal of his troops from Ft. Moultrie to Ft. Sumter in Dec. 1860, though the removal itself probably was not in violation of a pledge given by the president to preserve the *status quo* in Charleston harbour until the arrival of the South Carolina commissioners in Washington. The assertion that the president was prevented from ordering Anderson back to Ft. Moultrie only by the threat of four members of the cabinet to resign was unfounded.

On the expiration of his term of office (March 4, 1861) Buchanan retired to his home at Wheatland, near Lancaster, Pa., where he actively supported the Union until his death on June 1, 1868. His mistakes as president have been so emphasized as to obscure the fact that he was a man of unimpeachable honesty, of the highest patriotism and of considerable ability.

**BIBLIOGRAPHY.**—G. T. Curtis's *The Life of James Buchanan* (1883) is the standard biography; Curtis, however, was a close personal and political friend, and his work is too eulogistic. More trustworthy is the account given by J. F. Rhodes in the first two volumes of his *History of the United States since the Compromise of 1850* (1902-07). J. B. Moore has edited *The Works of James Buchanan, comprising his Speeches, State Papers, and Private Correspondence* (1908-10). J. B. Ranch's study of Buchanan's attitude on slavery in the *Pennsylvania Magazine of History and Biography* (April, 1927) is interesting. See also Louis M. Sears, "August Belmont, Banker in Politics" in the *Historical Outlook* (April, 1924) and the *Quarterly Journal of the New York State Historical Association* (Oct., 1926).

**BUCHANAN, ROBERT WILLIAMS** (1841-1901), British poet, novelist and dramatist, son of Robert Buchanan (1813-66), Owenite lecturer and journalist, was born at Caverswall, Staffordshire, and was educated at the high school and the University of Glasgow. After a period of struggle and disappointment in London Buchanan published *Undertones* in 1863.

The article which, under the *nom de plume* of Thomas Maitland, he contributed to the *Contemporary Review* for Oct. 1871, entitled "The Fleshly School of Poetry," is chiefly remembered by the replies it evoked from D. G. Rossetti in a letter to the *Athenaeum* (Dec. 16 1871), entitled "The Stealthy School of Criticism," and from Swinburne in *Under the Microscope* (1872). Buchanan himself afterwards regretted the violence of his attack, and the "old enemy" to whom *God and the Man* is dedicated was Rossetti. In 1876 appeared *The Shadow of the Sword*, the first and one of the best of a long series of novels. Buchanan was also the author of many successful plays, among which may be mentioned *Lady Clare*, produced in 1883; *Sophia* (1886), an adaptation of *Tom Jones*; *A Man's Shadow* (1890); and *The Charlatan* (1894). In collaboration with Harriett Jay he wrote the melodrama *Alone in London*. He died at Streatham on June 10 1901.

See his *Complete Poetical Works* (1901); Harriett Jay, *Robert Buchanan; some Account of his Life* (1903); and A. Symons, *Some Studies in Prose and Verse* (1904).

**BUCHAREST**, the capital of Rumania, and chief town of the department of Ilfov. Pop. (1927), approximately 860,000, including a large number of Jews, in whose hands commerce and finance largely rests. With its outlying parts, Bucharest covers more than 20 square miles. It lies in a slight hollow, traversed from north-west to south-east by a small river, the Dimbovita, most of the city lying on the left bank. A range of low hills extends to the west and south-west; on all other sides there are flat plains, only recently drained. The city is thus very exposed, and the extremes of climate are severe; great summer heats being followed by exceed-

ingly cold winds in autumn and winter. Bucharest is not an old town. According to one tradition, it was founded by a shepherd named Bucur, commemorated in the name of a church, the Biserica Bucur. Another tradition connects it with the word *bucurie*, Rumanian for "pleasure," and with a victory gained by Prince Mircea of Walachia (c. 1383-1419) over the Turks. More likely it was first built as a fortress, on the site of the Daco-Roman Thyanus, to command the passes into Transylvania. It was burnt by the Turks in 1595; but in the next century was already the seat of the Metropolitan of Walachia, and in 1698 was chosen for his capital by Constantine Brancovan, Hospodar of Walachia. In the 18th and early 19th centuries, during which it was frequently disputed by the Turks, Russians and Austrians, it was Phanariot Greek and Jewish rather than Rumanian. It then began to seek the implications in its name. It was already notorious for its gaiety and luxury, although still small and in many respects primitive. The houses were mostly of wood, paving very rough and lighting scanty; fires were frequent, earthquakes not uncommon. The plague visited it in 1718, 1738, 1793 and 1813, in which year 70,000 persons died in six weeks. It was occupied by Russian troops in 1828, 1848 and 1853-54 and by Austrians in 1854-57. In 1861 it was made the capital of the new Rumania (see *RUMANIA: History*) and with the accession of Prince Charles, in 1866, a gradual reform began. The river was enclosed within embankments; sewerage and pure water were supplied, gas and electric light installed, and electric or horse tramways laid down in the principal streets, which were paved with granite or wood. The wooden houses gave way to edifices of brick, overlaid with white or tinted plaster and ornamented with figures or foliage in terracotta. In the poorer quarters on the outskirts, the one-storied Walachian peasant cottage survived; but slums, in the strict sense, there were none. In the war of 1916-18 some damage was done by the German occupation; but the city was thoroughly cleansed. After the war, the population increased immensely; there was much overcrowding, new industrial quarters sprang up, and Bucharest had to adapt itself rather hurriedly to be the capital of a large country.

The main street of Bucharest is the Calea Victoriei, named in honour of the Rumanian success at Plevna (1877). Starting from the Băneasa racecourse, outside and north of the city (the favourite fashionable drive), this thoroughfare, here called the *Chaussée Soșea*, traverses a public garden, the Kisilev park, laid out in imitation of the Parisian *Champs Élysées*, passes under an *Arc de Triomphe* and, leaving on its left the ethnographical and natural history museums, enters the city. The boulevards, known as *Independentei*, *Elisabetei*, *Universitei*, *Caroli I.* and *Protopesco*, run in a practically straight line east and west. Starting in the Cotroceni and botanic gardens, they cross the river, leave on the left the pleasant Cisimigiu garden, cross the Calea Victoriei, and proceed past the university and City Hall. Of the four sectors formed by these two intersecting thoroughfares, the outer portions of those in the north-west and south-west are largely occupied by the railway stations, arsenal and barracks; the north-east-north is residential, but the Obor, or popular market, lies on its extremity. The south-east is the business quarter, containing the Lipsani, or principal merchants' quarter, named after the annual Leipzig fair whence goods were formerly obtained. The wealthy portion of the town is the centre. The fortifications, which surround the town at a mean distance of four miles were constructed in 1885-96 from plans drafted by the Belgian engineer General Brialmont in 1883. Their perimeter is about 48 miles. They were considered the strongest in Europe, but it proved impossible to hold them against the Germans in 1916.

Bucharest contains a great number of churches, usually small, in the Byzantine style. The metropolitan church, which stands on an eminence south of the city, was built 1656-65. It has the form of a Greek cross, and is surrounded by a cloister, with four main entrances, each surmounted by a turret. The churches of Spiridon the New (1768), the Doamna Balasa (1751), with its rich carving and frescoes, and the ancient Biserica Bucur are also noteworthy. There is a Roman Catholic cathedral, synagogues, and Protestant, Armenian and Lipovan churches.

Bucharest is a great educational centre. Besides the ordinary ecclesiastical seminaries, lyceums, gymnasia and elementary schools, it possesses schools of commerce, science and art institutes, and training colleges, for engineers and veterinary surgeons; while the university, founded in 1864, has faculties of theology, philosophy, literature, law, science, medicine and pharmacy. Students pay no fees except for board. The national library, containing many precious Oriental documents, and the meeting-hall of the Rumanian senate, are both included in the university buildings. Other libraries are those of the Nifon seminary, of the Charles University Foundation (*Fundatiunea universitara Carol*), which endows research, and rewards literary or scientific merit; the central library, and the library of the academy, which also contains a museum of natural history and antiquities. There are numerous philanthropic institutions. There are nine theatres, one, the national, State-conducted. Minor places of amusement abound; as also do clubs—political, social and sporting—hotels and restaurants. A feature of Bucharest are Russian coach and sledge-drivers of the Lipovan sect. The suburbs are still national and picturesque; the centre extremely elegant.

Bucharest is the winter residence of the royal family, the meeting-place of parliament and the seat of an appeal court (*Curtea de Apel*), of the supreme court (*Curtea de Casatie*), of the ministries, the national bank, the bank of Rumania, many lesser credit establishments and a chamber of commerce. The railway lines which meet on the western limit of the city give access to all parts. Bucharest has a very large transit trade in petroleum, timber and agricultural produce; above all, in wheat and maize. Its industries include petroleum-refining, extraction of vegetable oils, cabinet-making, brandy-distilling, tanning, and the manufacture of machinery, wire, nails, metal-ware, cement, soap, candles, paste, starch, paper, cardboard, pearl buttons, textiles, leather goods, ropes, glucose, army supplies, preserved meat and vegetables, and confectionery. An important fair is held for seven days in each year.

**BUCHER, LOTHAR** (1817–1892), German publicist, was born on Oct. 25, 1817, at Neu Stettin, in Pomerania. Elected a member of the National Assembly in Berlin in 1848, he was an active leader of the extreme democratic party. With others of his colleagues he was in 1850 brought to trial for having taken part in organizing a movement for refusal to pay taxes; he was condemned to 15 months' imprisonment in a fortress, but fled to London. He acted as special correspondent of the *National Zeitung*, and gained a great knowledge of English life; and he published a work, *Der Parlamentarismus wie er ist*, a criticism of parliamentary government, which shows a marked change in his political opinions. In 1864 he was offered by Bismarck a position in the Prussian foreign office. He acted as Bismarck's secretary, and was the man who probably enjoyed the greatest amount of his confidence. It was he who drew up the text of the constitution of the North German Confederation; in 1870 he was sent on a confidential mission to Spain in connection with the Hohenzollern candidature for the Spanish crown; he assisted Bismarck at the final negotiations for the treaty of Frankfurt, and was one of the secretaries to the Congress of Berlin; he also assisted Bismarck in the composition of his memoirs. Bucher's influence was directed against the economic doctrines of the Liberals; in 1881 he published a pamphlet criticizing the influence and principles of the Cobden Club. He died at Glion, in Switzerland, on Oct. 12, 1892.

See Heinrich v. Poschinger, *Ein 48er: Lothar Buchers Leben und Werke* (1890); Busch, *Bismarck: some Secret Pages of his History* (1898).

**BUCHEZ, PHILIPPE BENJAMIN JOSEPH** (1796–1865), French author and politician, was born at Matagne-la-Petite, now in Belgium, then in the French department of the Ardennes. In 1825 he graduated in medicine, and about the same time he became a member of the Saint-Simonian Society presided over by Bazard, Barthélemy Prosper Enfantin, and Olinde Rodrigues, and contributed to its organ, the *Producteur*. He left it in consequence of aversion to the strange religious ideas developed by its "Supreme Father," Enfantin, and founded a peri-

odical called *L'Européen* for the advocacy of his theory of Christian socialism. In 1833 he published an *Introduction à la science de l'histoire* (2nd ed., improved and enlarged, 1842). Next he edited, with M. Roux-Lavergne (1802–74), the *Histoire parlementaire de la Révolution française* (1833–38; 40 vols.). It was reviewed by Carlyle (*Miscellanies*), parts of whose own history of the French Revolution are mainly drawn from it. The editors saw in the French Revolution an attempt to realize Christianity. In the *Essai d'un traité complet de philosophie au point de vue du Catholicisme et du progrès* (1839–40) Buchez endeavoured to co-ordinate in a single system the political, moral, religious and natural phenomena of existence. Denying the possibility of innate ideas, he asserted that morality comes by revelation, and is therefore not only certain, but the only real certainty. In 1848 he became president of the Constituent Assembly, but only retained the position for a very short time. A *Traité de politique* (published 1866), which may be considered as the completion of his *Traité de philosophie*, was the most important of the productions of the last period of his life.

See A. Ott, "P. B. J. Buchez," in *Journal des économistes* for 1865.

**BUCHHOLZ**, a town in Saxony, 1,700ft. above sea, among the Erzgebirge, 18m. S. of Chemnitz, near Annaberg. Pop. 8,600. The Gothic church of St. Catherine has some paintings of the school of Wohlgemuth (1434–1519). Lace-making, the chief industry, dates from 1589. Chenille, cardboard boxes, etc., are also made.

**BUCHNER, EDUARD** (1860–1917), German chemist, was born at Munich May 20 1860. He was professor at Berlin (1898), at Breslau (1909) and Würzburg (1911). Buchner devoted himself to researches in connection with fermentation and enzyme action. In 1903 he was able to confirm Traube's theory by demonstrating that the active cause of alcoholic fermentation is due to the action of different enzymes contained in yeast and not to the yeast cell itself. Concerning the physiological nature and meaning of fermentation he showed that a ferment (zymase) can be extracted from yeast cells which causes sugar to break up into carbon dioxide and alcohol.

Buchner, who gained the Nobel Prize for chemistry in 1907, was killed in the World War on Aug. 24 1917.

**BÜCHNER, LUDWIG** (1824–1899), German philosopher and physician, was born at Darmstadt. He studied at Giessen, Strasbourg, Würzburg and Vienna. In 1852 he became lecturer in medicine at the University of Tübingen, where he published his great work *Kraft und Stoff* (1855). The extreme materialism of this work excited so much opposition that he was compelled to give up his post at Tübingen. He retired to Darmstadt, where he practised as a physician and contributed regularly to pathological and physiological magazines. He continued his philosophical work in defence of materialism, and published *Natur und Geist* (1857), *Aus Natur und Wissenschaft* (vol. i., 1862; vol. ii., 1884), *Fremdes und Eigenes aus dem geistigen Leben der Gegenwart* (1890), *Darwinismus und Socialismus* (1894). He died at Darmstadt on May 1, 1899. *Im Dienste der Wahrheit* (1899), a collection of selected essays from his works, contains a notice of him by his brother, Alexander Büchner.

**BUCHU** or **BUKA LEAVES**, the produce of several shrubby plants belonging to the genus *Barosma* (family Rutaceae), natives of the Cape of Good Hope. The principal species are *B. betulina*, *B. crenulata*, and *B. serratifolia*. (See CAMPHORS.)

**BUCK, CARL DARLING** (1866– ), American philologist, was born Oct. 2, 1866, at Orland, Maine. He graduated at Yale in 1886, and was a post-graduate student there, at the American school of classical studies in Athens, and in Leipzig. In 1892 he became assistant professor and in 1900 professor of Sanskrit and Indo-European comparative philology in the University of Chicago; but it is in the narrower field of the Italic dialects that his important work lies, including *Der Vocalismus der Oskischen Sprache* (1892); *The Oscan-Umbrian Verb-System* (1895), and *Grammar of Oscan and Umbrian* (1904). He also wrote *Introduction to the Study of the Greek Dialects* (1909).

**BUCK, DUDLEY** (1839–1909), American musical composer, was born in Hartford, Connecticut, on March 10, 1839. He

studied at Leipzig, Dresden and Paris. After assisting Theodore Thomas as conductor of the renowned New York orchestral concerts (1875), he became organist of the Church of the Holy Trinity, Brooklyn (1877-1903). He was well known as a composer of church music cantatas (*Columbus*, 1876; *Golden Legend*, 1880; *Light of Asia*, 1885, etc.), a grand opera, *Serapis*; a comic opera, *Deseret* (1880); a symphonic overture, *Marmion*, and a symphony in E flat. He died on Oct. 6, 1909.

**BUCK.** (1) The male of the fallow-deer and of goats, hares and rabbits. [O.E. *buc*, a he-goat] In the 18th century the word was used of a spirited, reckless young man of fashion. (2) The bleaching of clothes in lye, also the lye itself, and the clothes to be bleached, so a "buck-basket" means a basket of clothes for the wash (*cf.* the Ger. *Bauch*, Fr. *buée*). (3) Possibly from an obsolete word meaning "body," now only found in compound words, as "buck-board," a light, four-wheeled vehicle originally having one or more seats on a springy board serving both as springs and body; a "buck-wagon" (Dutch *bok-wagen*) is a South African cart with a frame projecting over the wheels, used for the transport of heavy loads. (4) A verb meaning "to leap," from "buck," a he-goat (or *cf.* Ger. *bücken*, and Eng. "bow," to bend). Seen in the compound "buck-jumper," a horse which leaps clear off the ground, with feet tucked together and arched back, descending with fore-feet rigid and head down.

**BUCK-BEAN** or **BOG-BEAN** (*Menyanthes trifoliata*, a member of the *Gentianaceae*), a bog-plant with a creeping stem, alternately arranged large leaves each with three leaflets, and spikes of white or pink flowers. The stout stem is bitter and has tonic and febrifuge properties. The plant is widely distributed through the north temperate zone.

**BUCKBOARD**, a horse-drawn, four-wheel vehicle without springs. Long elastic boards are fastened securely to the front and rear axles and two or more seats are mounted thereon. This primitive type of vehicle was originally devised for use in the rough and hilly districts of the United States.

**BÜCKEBURG**, town, north-west Germany, capital of the Free State of Schaumburg-Lippe, 6m. east of Minden. Pop. (1925) 5,645. It arose around the castle in the 14th century, but was not walled until the 17th century. A ring of promenades has since replaced the walls.

**BUCKET-SHOP**, a term applied to the "business" of a sham stock-broker who does not deal in securities, but who conducts a gambling office in which, in effect, he bets with his clients upon unfair terms. His usual method is to encourage speculators to gamble for a rise in price which he confidently predicts to them, promising large profits quickly harvested. No "buying" is done, and the bucket-shop keeper carefully guards himself from stating in direct terms that he has bought. He asks for a margin or "cover" from his client, and makes great play with the statement that not more than the cover can be lost. As this cover amounts to little, if anything, more than the difference between the buying and selling prices of the stock or share gambled in, the unfortunate speculator often loses his bet as soon as he makes it. The bucket-shop keeper sometimes opens his dealings, however, by sending a small cheque to the speculator for pretended winnings to induce him to plunge more deeply in a further deal.

The bucket-shop keeper carefully words his order-forms to avoid the meshes of the law. Thus, in an actual case, the circular inviting to a gamble in a certain industrial share included an order-form running as follows:—

"I hereby instruct you to open on my account . . . shares and enclose £ . . . being 1s. per share deposit, which is my sole liability on this transaction."

The cover of one shilling per share in this case is the difference between the buying and selling price of the share, so that the deposit is run off upon the signing of the form.

It is quite unfair to apply the term "bucket-shop" to the business of every stock-broker who is not a member of an official stock-exchange, for there are perfectly honest "outside" stock-brokers who conduct a legitimate business.

The origin of the term is American. According to the *New English Dictionary*, it is supposed to have arisen in Chicago. The

Board of Trade there forbade dealings in "options" in grain of less than 5,000 bushels. An "Open Board of Trade" or unauthorised exchange was established for the use of small gamblers, in a neighbouring street below the rooms of the Board of Trade. The lift used by members of the Board of Trade would be sent down to bring up from the "Open Board" what was known as a "bucketful" of the smaller speculators when business was slack.

**BUCKFASTLEIGH**, urban district, Devonshire, England, co-extensive with the parish of East Buckfastleigh. Pop. (1931) 2,406. It lies on the river Dart, 7 m. N.W. of Totnes by the G.W.R. Buckfast abbey is a Tudor residence near the ruins of a Benedictine abbey which was refounded by the Cistercians in 1137. It was restored to use in 1882 by a Benedictine community. Buckfastleigh was a centre of the serge industry until recent times. It is in the centre of the hunting country, and the river Dart provides excellent salmon and trout fishing.

**BUCKHANNON**, a city near the centre of West Virginia, U.S.A., on the Buckhannon river, at an elevation of 1,400ft.; the county seat of Upshur county. It is served by the Baltimore and Ohio railroad. The population in 1930 was 4,374. It has natural gas and several manufacturing plants, and is the seat of West Virginia Wesleyan College, established here in 1890. Buckhannon occupies the site of the first permanent settlement west of the Alleghenies. Neither the city nor the county has ever licensed a saloon.

**BUCKHOLDT** (properly BEUKELSZ, or BOCKELSZOON), **JOHANN** (c. 1508-1536), Dutch Anabaptist fanatic, better known as JOHN OF LEYDEN, from his place of birth, was the illegitimate son of Bockel, burgomaster of Soevenhagen, who afterwards married his mother. He was born about 1508, apprenticed to a tailor, became influenced by the opinions of Thomas Münzer, travelled in pursuit of his trade (being four years in London), married a widow, became bankrupt, and in Sept. 1533 joined the Anabaptist movement under Johann Matthysz (Matthyssoon), baker of Haarlem. He had little education, but some literary faculty, and had written plays. On Jan. 13, 1534, he appeared in Münster as an apostle of Matthysz. Good-looking and fluent, he fascinated women, and won the confidence of Bernard Knipperdollinck, a revolutionary cloth merchant, who gave him his daughter in marriage. The Münster Anabaptists took up arms on Feb. 9, 1534 (*see* ANABAPTISTS). On the death of Matthysz (1534), Buckholdt succeeded him as prophet, added his widow to the number of his wives, and organized a new constitution for Münster, with 12 elders (suggested by the tribes of Israel) and other officers of a theocracy, but soon superseded these, making himself king of the new Zion. His arbitrary rule was marked by pomp and severity. Münster was retaken (June 25, 1535) by its prince-bishop, Franz von Waldeck. Buckholdt, after many indignities, was barbarously executed on Jan. 22, 1536; his body and those of his companions were hung in cages to the tower of the Lamberti church. His portrait is in *Grouwelen der Hoofketteren* (Leyden, 1607; an English edition is appended to Alexander Ross's *Pansebeia*, 2nd ed., 1655); a better example of the same is given by Arend.

*See* Arend, *Algemeene Geschiedenis des Vaderlands* (1846), ii., iii., 6-9; Van der Aa, *Biographisch Woordenboek der Nederlanden* (1853); E. Belfort Bax, *Rise and Fall of the Anabaptists* (1903). (A. G.)

**BUCKIE**, fishing town and police burgh, Banffshire, Scotland, on the Moray Firth, at the mouth of Buckie burn, about 17m. W. of Banff, with a station on the L.N.E. railway. Pop. (1931), 8,688. It is the centre of a fishery district and for one of the largest Scottish fleets in the herring season, and is also the chief seat of line fishing in Scotland. The harbour, with an outer and inner basin, covers an area of 18 acres. Besides the fisheries and fish-curing trade there are engineering works, a distillery, saw-mills, shipyards, and works for the making of ropes, sails and nets. The burn divides the town into Buckie and Buckpool. Portgordon, 2 m. W. of Buckie is a thriving fishing village; the harbour was enlarged in 1909. Rathven, some 2m. E., lies in a fertile district, where there are several antiquities.

**BUCKINGHAM, EARLS, MARQUESSES AND DUKES OF.** The origin of the earldom of Buckingham (to be distinguished from that of Buckinghamshire, *q.v.*) is obscure

According to Mr. J. H. Round (in G. E. C.'s *Peerage*, s.v.) there is some charter evidence for its existence under William Rufus; but the main evidence for reckoning Walter Giffard, lord of Longueville in Normandy, who held 48 lordships in the county, as the first earl, is that of Odericus Vitalis, who twice describes Walter as "Comes Bucchingehamensis," once in 1097, and again at his death in 1102. After the death of Walter Giffard, 2nd earl, in 1164, the title was assumed by Richard de Clare, earl of Pembroke ("Strongbow"), in right of his wife, Rohais, sister of Walter Giffard I.; and it died with him in 1176. In 1377 Thomas of Woodstock (duke of Gloucester) was created earl of Buckingham at the coronation of Richard II. (July 15), and the title of Gloucester having after his death been given to Thomas le Despenser, his son Humphrey bore that of earl of Buckingham only. On Humphrey's death, his sister Anne became countess of Buckingham in her own right. She married Edmund Stafford, earl of Stafford, and on her death (1438) the title of Buckingham passed to her son Humphrey Stafford, earl of Stafford, who in 1444 was created duke of Buckingham. This title remained in the Stafford family until the attainder and execution of Edward, 3rd duke, in 1521 (see BUCKINGHAM, HENRY STAFFORD, 2nd duke of).

In 1617 King James I. created George Villiers earl, in 1618 marquess, and in 1623 duke of Buckingham (see BUCKINGHAM, GEORGE VILLIERS, 1st duke of). The Marquessate and dukedom became extinct with the death of the 2nd (Villiers) duke (q.v.) in 1687; but the earldom was claimed, under the special remainder in the patent of 1617, by a collateral line of doubtful legitimacy claiming descent from John Villiers, 1st Viscount Purbeck. The title was not actually borne after the death of John Villiers, styling himself earl of Buckingham, in 1723. The claim was extinguished by the death of George Villiers, a clergyman, in 1774.

In 1703 John Sheffield, marquess of Normanby, was created "duke of the county of Buckingham and of Normanby." He was succeeded by his son Edmund who died in Oct. 1735 when the titles became extinct.

The title of marquess and duke of Buckingham in the Grenville family (to the holders of which the remainder of this article applies) was derived, not from the county, but from the town of Buckingham. It originated in 1784, when the 2nd Earl Temple was created marquess of Buckingham "in the county of Buckingham," this title being elevated into the dukedom of Buckingham and Chandos for his son in 1822.

GEORGE NUGENT TEMPLE GRENVILLE, 1st marquess of Buckingham (1753-1813), the second son of George Grenville, was born on June 17, 1753. Educated at Eton and Christ Church, Oxford, he was M.P. for Buckinghamshire from 1774-79. In the House of Commons he was a sharp critic of the American policy of Lord North. In Sept. 1779 he succeeded his uncle as 2nd Earl Temple; in July 1782 he became a member of the privy council and lord-lieutenant of Ireland in the Rockingham ministry. On his advice the Irish Judicature Act of 1783 was passed, which supplemented the legislative independence granted to Ireland in 1782. By royal warrant he created the order of St. Patrick in Feb. 1783, with himself as the first grand master. Temple left Ireland in 1783, and again turned his attention to English politics. He enjoyed the confidence of George III., and having opposed Fox's East India bill, he was authorized by the king to say that "whoever voted for the India bill was not only not his friend, but would be considered by him as an enemy," a message which ensured the defeat of the bill. He was appointed a secretary of state when the younger Pitt formed his ministry in Dec. 1783, but resigned two days later. In Dec. 1784 he was created marquess of Buckingham "in the county of Buckingham." In Nov. 1787 he was appointed lord-lieutenant of Ireland under Pitt, but his second tenure of this office was hardly as successful as the first. He was denounced by Grattan for extravagance; was censured by the Irish houses of parliament for refusing to transmit to England an address calling upon the prince of Wales to assume the regency; and he could only maintain his position by resorting to bribery on a large scale. He resigned in Sept.

1789, and subsequently took very little part in politics, although he spoke in favour of the union with Ireland. He died at Stowe House, Buckingham, on Feb. 11 1813.

His elder son, RICHARD GRENVILLE, 1st duke of Buckingham and Chandos (1776-1839), was M.P. for Buckinghamshire from 1797 to 1813, and, as Earl Temple, took an active part in politics. In Feb. 1813 he succeeded his father as marquess of Buckingham; and having married the only child of the 3rd duke of Chandos, he was created duke of Buckingham and Chandos in 1822. Owing to financial embarrassments, the duke lived out of England for some time, and in 1862 an account of his travels was published, as *The Private Diary of Richard, Duke of Buckingham and Chandos*.

He was succeeded by his only child, RICHARD GRENVILLE, 2nd duke of Buckingham and Chandos (1797-1861). Educated at Eton and Oriel college, Oxford, he was known as Earl Temple and subsequently as marquess of Chandos. He was M.P. for Buckinghamshire from 1818 to 1839, and was responsible for the "Chandos clause" in the Reform bill of 1832. He was lord privy seal from Sept. 1841 to Jan. 1842, and partly owing to his opposition to the repeal of the corn laws was known as the "Farmers' Friend." In 1847 his residences were seized by his creditors, and the duke left England for a time. He died in London, on July 29, 1861. He wrote: *Memoirs of the Court and Cabinets of George III.* (London, 1853-55); *Memoirs of the Court of England, 1811-1820* (London, 1856); *Memoirs of the Court of George IV.* (London, 1859); and *Memoirs of the Court and Cabinets of William IV. and Victoria* (London, 1861).

RICHARD GRENVILLE, 3rd duke of Buckingham and Chandos (1823-1889), the only son of the 2nd duke, was educated at Eton and Christ Church, Oxford, and, as marquess of Chandos, was M.P. for Buckingham from 1846 to 1857. After succeeding to the dukedom he became lord president of the council, and subsequently secretary for the colonies in the Conservative Government of 1866-68. From 1875 to 1880 he was governor of Madras, and in 1886 was chosen chairman of committees in the House of Lords. As he left no son the dukedom became extinct on his death.

**BUCKINGHAM, GEORGE VILLIERS, 1ST DUKE OF** (in the Villiers line) (1592-1628), English statesman, born on Aug. 20, 1592, was a younger son of Sir George Villiers of Brooksby. He could dance well, fence well, and talk a little French, when in August 1614 he was brought before the king's notice in the hope that he would take a fancy to him. The moment was favourable. The king was tiring of Robert Carr, Earl of Somerset, though for some little time still his pre-eminence was maintained. But on April 23, 1615, Villiers, in spite of Somerset, was promoted to be gentleman of the bedchamber; the charge of murdering Overbury, brought against Somerset in September, completed his downfall, and Villiers at once stepped into the vacant place. Honours were heaped upon him, and on Jan. 5, 1617, he was made earl, and on Jan. 1, 1618, marquess of Buckingham. With the exception of the earl of Pembroke he was the richest nobleman in England.

On Jan. 19, 1619, James made him lord high admiral of England, hoping that the ardent, energetic youth would reform the fleet which had been almost ruined by the speculation and carelessness of the officials. But Buckingham was too ready to fill up appointments with men who flattered him, and too reluctant to dismiss them, if they served their country ill, to effect any permanent change for the better.

At this time all England was talking of the revolution in Bohemia in the year before, and sympathy with the Continental Protestants was increased when it was known that James's son-in-law had accepted the Crown of Bohemia, and that in the summer of 1620 a Spanish force was preparing to invade the Palatinate. Buckingham at first had thrown himself into the popular movement. Before the summer of 1620 was at end, incensed by injuries inflicted on English sailors by the Dutch in the East Indies, he had swung round and was in close agreement with Gondomar, the Spanish ambassador. He had now married Lady Katherine Manners, the daughter of the earl of Rutland, who was at heart a Roman

Catholic, though she outwardly conformed to the English Church; and this alliance may have had something to do with the change.

The parliament which met in 1621, angry at discovering that no help was to be sent to the Palatinate, broke out into a loud outcry against the system of monopolies, from which Buckingham's brothers and dependants had drawn a profit, which was believed to be greater than it really was. At a conference of the Commons with the Lords, Buckingham acknowledged that his two brothers had been implicated, but declared that his father had begotten a third who would aid in punishing them. In the impeachment of Bacon which soon followed, Buckingham, who owed much to his wise counsels, gave him that assistance which was possible without injury to himself, but afterwards, when the cry rose louder against the chancellor, joined in the attack, though he sought to mitigate the severity of the charges against him. Nevertheless, he took advantage of Bacon's need of assistance to bring from him the possession of York House.

In the winter of 1621, and the succeeding year, Buckingham was entirely in Gondomar's hands; and it was only with some difficulty that in May 1622 Laud argued him out of a resolution to declare himself a Roman Catholic. There can be little doubt that when the Spanish ambassador left England the following May he had come to an understanding with Buckingham on the project of the marriage of the prince of Wales to the infanta Maria. Buckingham and the prince reached Madrid on March 7, 1623. Each party had been the dupe of the other. Charles and Buckingham hoped for the restitution of the Palatinate to James's son-in-law, as a marriage gift to Charles; while the Spaniards counted on the conversion of Charles to Roman Catholicism and other extreme concessions (*see* CHARLES I.). The political differences were soon accentuated by personal disputes between Buckingham and Olivares and the grandees, and when the two young men sailed together from Santander in September it was with the final resolution to break entirely with Spain.

In his absence James had raised him to a dukedom. But the splendour which now gathered round Buckingham was not due to James's favour. He had put himself at the head of the popular movement against Spain, and when James, unwillingly convinced that the Palatinate could only be recovered by force, summoned the parliament which met in Feb. 1624, Buckingham, with the help of the heir apparent, took up an independent political position. James was half driven, half persuaded to declare all negotiations with Spain at an end. For the moment Buckingham was the most popular man in England.

The Commons would have been content with sending some assistance to the Dutch, and with entering upon a privateering war with Spain. James believed that the Palatinate could only be recovered by a Continental alliance, in which France took part. Negotiations were therefore opened for a marriage between Charles and the sister of Louis XIII., Henrietta Maria. Buckingham, impatient to begin the war as soon as possible, persuaded Charles, and the two together persuaded James to throw over the promises to the Commons and to accept the French terms, which included concessions to the English Catholics.

Buckingham now prepared to throw 12,000 Englishmen, under a German adventurer, Count Mansfeld, through France into the Palatinate. The French insisted that he should march through Holland. It mattered little which way he took. Without provisions, and without money to buy them, the wretched troops sickened and died in the winter frosts. Buckingham's first military enterprise ended in disastrous failure. Buckingham had offered to send aid to Christian IV., king of Denmark, who was proposing to make war in Germany, and had also a plan for sending an English fleet to attack Genoa, the ally of Spain, and a plan for sending an English fleet to attack Spain itself. But before these schemes could be carried into operation James died on March 27, 1625.

The new king and Buckingham were at one in their aims and objects. Buckingham was sent over to Paris to urge upon the French court the importance of converting its alliance into active co-operation. The Huguenots of La Rochelle were in rebellion, and James had promised the aid of English ships to suppress that rebellion. Buckingham desired to save Charles from compromis-

ing himself with his parliament by the appearance of English ships in an attack upon Protestants. When he returned his main demands were refused, but hopes were given him that peace would be made with the Huguenots. On his way through France he had the insolence to make love to the queen of France.

Soon after his return parliament was opened. Charles had entered into engagements involving an enormous expenditure, and these engagements involved a war on the Continent, which had never been popular in the House of Commons. The Commons, too, suspected that the marriage treaty contained engagements of which they disapproved. They asked for the full execution of the laws against the Roman Catholics, and voted but little money in return. Before they reassembled at Oxford on Aug. 1, the English ships had found their way into the hands of the French, to be used against La Rochelle. The Commons met in an ill-humour. They had no confidence in Buckingham, and they asked that persons whom they could trust should be admitted to the king's council before they would vote a penny. Charles stood by his minister, and on Aug. 12 he dissolved his first parliament.

Buckingham and his master then threw over their engagements to France on behalf of the English Roman Catholics. On the other hand they sent out a large fleet to attack Cadiz, and to seize the Spanish treasure-ships. Buckingham went to The Hague to raise an immediate supply by pawning the Crown jewels, to place England at the head of a great Protestant alliance, and to enter into fresh obligations to furnish money to the king of Denmark. It all ended in failure. The fleet returned from Cadiz, having effected nothing. The Crown jewels produced but a small sum, and the money for the king of Denmark could only be raised by an appeal to parliament. In the meanwhile the king of France was deeply offended by the treatment of the Roman Catholics, and by the seizure of French vessels on the ground that they were engaged in carrying goods for Spain.

Charles's second parliament, which met on Feb. 6, 1626, impeached Buckingham before the House of Lords on a long string of charges. Many of these charges were exaggerated, and some were untrue. His real crime was his complete failure as the leader of the administration. Charles dissolved his second parliament as he had dissolved his first. Subsequently the Star Chamber declared the duke innocent of the charges. Recourse was had to a forced loan, and men were thrown into prison for refusing to pay it. Disasters had occurred to Charles's allies in Germany. The fleet sent out under Lord Willoughby (earl of Lindsey) against the Spaniards returned home shattered by a storm, and a French war was impending in addition to the Spanish one. The French were roused to reprisals by Charles's persistence in seizing French vessels. Unwilling to leave La Rochelle open to the entrance of an English fleet, Richelieu laid siege to it. On June 27, 1627, Buckingham sailed from Portsmouth at the head of a numerous fleet, and a considerable land force, to relieve the besieged city.

His first enterprise was the siege of the fort of St. Martin's, on the Isle of Ré, which proved more difficult than had been expected. Before the reinforcements requested by Buckingham could arrive the French had thrown a superior force upon the island, and he was driven to retreat on Oct. 29 with heavy loss, only 2,989 troops out of nearly 7,000 returning to England.

In the parliamentary battle, which ended in the concession of the Petition of Right, Buckingham resisted as long as it was possible to resist the demand of the Commons, that the king should abandon his claim to imprison without showing cause. When the first unsatisfactory answer to the petition was made by the king on June 2, the Commons suspected, probably with truth, that it had been dictated by Buckingham. They prepared a remonstrance on the state of the nation, and Coke said, "The duke of Bucks is the cause of all our miseries . . . that man is the grievance of grievances." Though on June 7 the king granted a satisfactory answer to the petition, the Commons proceeded with their remonstrance, and on the 11th demanded Buckingham's dismissal. Charles refused to surrender Buckingham, and a few days later he prorogued parliament in anger.

With the clouds gathering round him, Buckingham went down to Portsmouth to take the command of one final expedition for

the relief of La Rochelle. For the first time even he was beginning to acknowledge that he had undertaken a task beyond his powers. He entered gladly into a scheme of pacification proposed by the Venetian ambassador. But before he could know whether there was to be peace or war, the knife of an assassin put an end to his career. John Felton, who had served at Ré, had been disappointed of promotion, and had not been paid that which was due to him for his services, read the declaration of the Commons that Buckingham was a public enemy, and eagerly caught at the excuse for revenging his private wrongs under cover of those of his country. Waiting, on the morning of Aug. 23, beside the door of the room in which Buckingham was breakfasting, he stabbed him to the heart as he came out.

Buckingham married Lady Katherine Manners, daughter of Francis, 6th earl of Rutland, by whom he left three sons and one daughter, of whom George, the second son (1628–87), succeeded to the dukedom.

Gardiner; *Life of Buckingham*, by Sir Henry Wotton (1642), reprinted in *Harleian Miscellany*, viii. 613; *A Parallel between Robert Earl of Essex and George late Duke of Buckingham*, by the same writer (1641), in the *Thomason Tracts*, 164 (20); *Characters* of the same by Edward, earl of Clarendon (1706); *Life of George Villiers, Duke of Buckingham, etc.* (1740); *Historical and Biographical Memoirs of George Villiers, Duke of Buckingham* (1819); *Letters of the Duke and Duchess of Buckingham* (1834); *Historia Vitae Ricardi II., etc.*, by Thos. Hearne (1729); *Documents illustrating the Impeachment of Buckingham*, published by the Camden Society and edited by S. R. Gardiner (1889); *Epistolae Hoelianae* (James Howell), 187, 189, 203; *Poems and Songs relating to George Villiers, Duke of Buckingham*, ed. by R. W. Fairholt for the Percy Society (1850); see also P. Gibbs, *The Romance of George Villiers, 1st Duke of Buckingham* (1908).

**BUCKINGHAM, GEORGE VILLIERS**, 2ND DUKE OF (in the Villiers line) (1628–1687), English statesman, son of the 1st duke, was born on Jan. 30, 1628. He was brought up, together with his younger brother Francis, by King Charles I. with his own children, and was educated at Trinity college, Cambridge, where he obtained the degree of M.A. in 1642. He fought for the king in the Civil War, and took part in the attack on Lichfield Close in April 1643. Subsequently, under the care of the earl of Northumberland, the two brothers travelled abroad and lived at Florence and Rome. When the second Civil War broke out they joined the earl of Holland in Surrey, in July 1648. Lord Francis was killed near Kingston, and Buckingham and Holland were surprised at St. Neots on the 10th, the duke succeeding in escaping to Holland. Charles II. admitted him to his privy council on April 6, 1650. In opposition to Hyde (see CLARENDON, 1st Earl of) he supported the alliance with the Scottish presbyterians, accompanied Charles to Scotland in June, and allied himself with Argyll, dissuading Charles from joining the royalist plot of October 1650, and being suspected of betraying the plan to the covenanting leaders. In the following year he was chosen to lead the projected movement in Lancashire and to command the Scottish royalists. He was present with Charles at the battle of Worcester on Sept. 3, 1651, and escaped safely alone to Rotterdam in October. In 1657 he returned to England, and on Sept. 15 married Mary, daughter of Lord Fairfax. Buckingham was soon suspected of organizing a Presbyterian plot against the Government, and in spite of Fairfax's interest with Cromwell an order was issued for his arrest on Oct. 9. He was confined at York House about April 1658, and having broken bounds was rearrested on Aug. 18 and imprisoned in the Tower, where he remained till Feb. 23, 1659.

On the king's return Buckingham, who met him at his landing at Dover, was at first received coldly; but he was soon again in favour. He accompanied the Princess Henrietta to Paris on her marriage with the duke of Orleans, but made love to her himself with such imprudence that he was recalled. On April 28, 1662, he was admitted to the privy council. The differences between Clarendon and Buckingham debarred the latter from high office. He therefore intrigued for Clarendon's fall, and in 1667 he was imprisoned for a short time in the Tower of London. But he was restored to favour and to his appointments on Sept. 15, and on the fall of Clarendon he became the chief minister, though holding no high office except that of master of the horse, bought from the

duke of Albemarle in 1668. He favoured religious toleration, supported a scheme of comprehension in 1668, and advised the declaration of indulgence in 1672. He upheld the original jurisdiction of the Lords in Skinner's case. With these exceptions Buckingham's tenure of office was chiefly marked by an amazing series of scandals and intrigues. Arlington, next to Buckingham himself the most powerful member of the Cabal and a favourite of the king, was his serious rival. Buckingham had from the first been an adherent of the French alliance, while Arlington concluded through Sir William Temple in 1668 the Triple Alliance. But on the complete *volte-face* and surrender made by Charles to France in 1670, Arlington as a Roman Catholic was entrusted with the first Treaty of Dover of May 20, while Buckingham was sent to France to carry on the sham negotiations which led to the public treaties of Dec. 31, 1670, and Feb. 2, 1672. In June 1672 he accompanied Arlington to The Hague to impose terms on the prince of Orange, and with Arlington arranged the new treaty with Louis. He was disappointed at being passed over for the command of the English forces in favour of Schomberg. He now knew of the secret Treaty of Dover, and towards the end of 1673 his jealousy of Arlington became open hostility. He threatened to impeach him, but in January 1674 an attack was made upon Buckingham himself simultaneously in both houses. In the Lords the trustees of the young earl of Shrewsbury complained that Buckingham continued publicly his intimacy with the countess; in the Commons he was attacked as the promoter of the French alliance, of "popery" and arbitrary government. Buckingham was dismissed, retired, reformed his ways, attended church with his wife, began to pay his debts, became a "patriot," and was claimed by the country or opposition party as one of their leaders. In the spring of 1675 he was conspicuous for his opposition to the Test oath and for his abuse of the bishops, and on Nov. 16 he introduced a bill for the relief of the Nonconformists. Buckingham was sent to the Tower for a short time in 1677 with three other lords for refusing an apology for having raised a constitutional question. He was released in July, and immediately entered into intrigues with Barillon, the French ambassador, with the object of hindering the grant of supplies to the king; and in 1678 he visited Paris to get the assistance of Louis XIV. for the cause of the opposition. He took an active part in the prosecution of those implicated in the supposed popish plot, and accused the lord chief justice (Sir William Scroggs) in his own court while on circuit of favouring the Roman Catholics. A writ was issued for his apprehension, but it was never served. He promoted the return of Whig candidates to parliament, constituted himself the champion of the dissenters, and was admitted a freeman of the city of London. He, however, separated himself from the Whigs on the exclusion question, probably on account of his dislike of Monmouth and Shaftesbury, was absent from the great debate in the Lords on Nov. 15, 1680, and was restored to the king's favour in 1684.

He took no part in public life after James's accession, but returned to his manor of Helmsley in Yorkshire, the cause of his withdrawal being probably exhausted health and exhausted finances. He died on April 16, 1687, from a chill caught while hunting, in the house of a tenant at Kirkby Moorside in Yorkshire, expressing great repentance and feeling himself "despised by my country and I fear forsaken by my God."<sup>1</sup> As he left no legitimate children the title became extinct.

Even Buckingham's critics admit that he was good-natured, generous, an unsurpassed mimic and the leader of fashion; and with his good looks, in spite of his moral faults and even crimes, he was irresistible to his contemporaries. His portrait has been drawn by Burnet, Count Hamilton in the *Mémoires de Grammont*, Dryden, Pope in the *Epistle to Lord Bathurst*, and Sir Walter Scott in *Peveril of the Peak*. He is described by Reresby as "the first gentleman of person and wit I think I ever saw," and Burnet bears the same testimony. Racing and hunting were his favourite sports, and his name long survived in the hunting songs of Yorkshire. He was the patron of Cowley, Sprat, Matthew Clifford and Wycherley. He dabbled in chemistry, and for some years, ac-

<sup>1</sup>*Quarterly Review*, Jan. 1898, p. 110.

cording to Burnet, "he thought he was very near the finding of the philosopher's stone." He set up glass works at Lambeth, the productions of which were praised by Evelyn; and he spent much money, according to his biographer Brian Fairfax, in building *insanae substructiones*. Dryden described him under the character of Zimri in the celebrated lines in *Absalom and Achitophel* (to which Buckingham replied in *Poetical Reflections on a late Poem . . . by a Person of Honour*, 1682):

A man so various, that he seemed to be  
Not one, but all mankind's epitome;  
Stiff in opinions, always in the wrong,  
Was everything by starts and nothing long;  
But in the course of one revolving moon,  
Was chymist, fiddler, statesman and buffoon . . .  
Beggar'd by fools, whom still he found too late,  
He had his jest, but they had his estate.

Buckingham wrote occasional verses and satires showing undoubted but undeveloped poetical gifts, a collection of which, containing however many pieces not from his pen, was first published by Tom Brown in 1704; while a few extracts from a commonplace book of Buckingham of some interest are given in an article in the *Quarterly Review* of Jan. 1898. He was the author of *The Rehearsal*, an amusing and clever satire on the heroic drama and especially on Dryden (first performed on Dec. 7, 1671, at the Theatre Royal, and first published in 1672), a deservedly popular play which was imitated by Fielding in *Tom Thumb the Great*, and by Sheridan in the *Critic*. Buckingham also published two adapted plays, *The Chances*, altered from Fletcher's play of the same name (1682) and *The Restoration or Right will take place*, from Beaumont and Fletcher's *Philaster* (pub. 1714); and also *The Battle of Sedgmoor* and *The Militant Couple* (pub. 1704). His works were edited by T. Evans (1775). Another work is named by Wood, *A Demonstration of the Deity*, of which there is now no trace.

**BIBLIOGRAPHY.**—The life of Buckingham has been well and accurately traced and the chief authorities collected in the article in the *Dict. of Nat. Biog.* (1899) by C. H. Firth, and in *George Villiers, and Duke of Buckingham*, by Lady Burghclere (1903). See also Wood's *Athenae Oxon.* (Bliss), iv. 207; *Biographia Britannica*, by Brian Fairfax, printed in H. Walpole's *Catalogue of Pictures of George, Duke of Buckingham* (1758); Arber's edition of the *Rehearsal* (1868); R. Series*, mss. of Duke of Buccleuch at Montagu House, of Mrs. Frankland-Russell-Astley, of Marq. of Ormonde, and Various Collections; and *English Hist. Rev.* (April 1905), xx. 373.

**BUCKINGHAM, HENRY STAFFORD**, 2nd DUKE OF (1454–1483), was the son of Humphrey Stafford, killed at the first battle of St. Albans in 1455, and grandson of Humphrey the 1st duke (cr. 1444) killed at Northampton in 1460, both fighting for Lancaster. The 1st duke, who bore the title of earl of Buckingham in right of his mother, was the son of Edmund, 5th earl of Stafford, and of Anne, daughter of Thomas, duke of Gloucester, youngest son of Edward III.; Henry's mother was Margaret, daughter of Edmund Beaufort, 2nd duke of Somerset, grandson of John of Gaunt. Thus he came on both sides of the blood royal, and this, coupled with the vastness of his inheritance, made the young duke's future of importance to Edward IV. He was recognized as duke in 1465, and next year was married to Catherine Woodville, the queen's sister. He was made a knight of the Garter in 1474, and in 1478 was high steward at the trial of George, duke of Clarence. He had not otherwise filled any position of importance, but his fidelity might seem to have been secured by his marriage. However, after Edward's death, Buckingham was one of the first persons worked

upon by Richard, duke of Gloucester. It was through his help that Richard obtained possession of the young king, and he was at once rewarded with the offices of justiciar and chamberlain of North and South Wales, and constable of all the royal castles in the principality and Welsh Marches. In the proceedings which led to the deposition of Edward V. he took a prominent part, and on June 24, 1483, he urged the citizens at the Guildhall to take Richard as king, in a speech of much eloquence, "for he was neither unlearned and of nature marvellously well spoken" (More). At Richard's coronation he served as chamberlain, and immediately afterwards was made constable of England and confirmed in his powers in Wales. But early in August Buckingham withdrew to Brecon, where he fell under the influence of his prisoner, John Morton (*q.v.*), who induced him to give his support to his cousin Henry Tudor, earl of Richmond. A widespread plot was soon formed, but Richard had early warning, and on Oct. 15, issued a proclamation against Buckingham. Buckingham, as arranged, prepared to enter England with a large force of Welshmen. His advance was stopped by an extraordinary flood on the Severn, his army melted away without striking a blow, and he himself took refuge with a follower, Ralph Bannister, at Lacon Hall, near Wem. The man betrayed him for a large reward, and on Nov. 1, Buckingham was brought to the king at Salisbury. Richard refused to see him, and after a summary trial had him executed next day (Nov. 2, 1483).

Buckingham's eldest son, Edward (1478–1521), eventually succeeded him as 3rd duke, the attainder being removed in 1485; the second son, Henry, was afterwards earl of Wiltshire. The 3rd duke played an important part as lord high constable at the opening of the reign of Henry VIII. and is introduced into Shakespeare's play, but he fell through his opposition to Wolsey, and in 1521 was condemned for treason and executed (May 17); the title was then forfeited with his attainder, his only son Henry (1501–1563), who in his father's lifetime was styled earl of Stafford, being, however, given back his estates in 1522, and in 1547 restored in blood by parliament with the title of Baron Stafford, which became extinct in this line with Roger, 5th Baron in 1640. In that year the barony of Stafford was granted to William Howard (1614–1680), who after two months was created Viscount Stafford; he was beheaded in 1680, and his son was created earl of Stafford in 1688, a title which became extinct in 1762; but in 1825 the descent to the barony of 1640 was established, to the satisfaction of the House of Lords, in the person of Sir G. W. Jerminham.

The chief original authorities for the life of the 2nd duke of Buckingham are the *Continuation of the Croyland Chronicle*, Sir Thomas More's *Richard III.*; and Fabyan's *Chronicle*. Amongst modern authorities consult J. Gairdner's *Richard III.*; and Sir J. Ramsay's *Lancaster and York*. (C. L. K.)

**BUCKINGHAM, JAMES SILK** (1786–1855), English author and traveller, was born near Falmouth, the son of a farmer. His youth was spent at sea. After years of wandering he established in 1818 the *Calcutta Journal*. This venture at first proved highly successful, but in 1823 the paper's outspoken criticisms of the East India Company led to the expulsion of Buckingham from India and to the suppression of the paper by John Adam, the acting governor-general. His case was brought before parliament, and a pension of £200 a year was awarded him by the East India Company as compensation. On his return to England Buckingham published the *Oriental Herald* (1824) and the *Athenaeum* (1828) which was not a success in his hands. In parliament, where he sat as member for Sheffield from 1832–37, he was a strong advocate of temperance and of social reform. He was a most voluminous writer, and at the time of his death was at work on his autobiography, two volumes of the intended four being completed and published (1855).

His youngest son, LEICESTER SILK BUCKINGHAM (1825–1867), was a successful playwright, several of his free adaptations of French comedies being produced in London between 1860 and 1867.

**BUCKINGHAM AND NORMANBY, JOHN SHEFFIELD**, 1st DUKE OF (1648–1721), English statesman and poet.

was born April 7 1648. He was the son of Edmund, 2nd earl of Mulgrave, and succeeded to that title on his father's death in 1658. He served in the fleet and in the army under Charles II., was dismissed from court in 1682, was a firm supporter of James II., but acquiesced in the Revolution. Nevertheless in 1696 he was dismissed from the privy council. On the accession of Anne, with whom he was a personal favourite, he became lord privy seal and lord-lieutenant of the North Riding of Yorkshire, and in 1703 duke of Buckingham and Normanby. During the predominance of the Whigs between 1705 and 1710 Buckingham was deprived of his office as lord privy seal, but in 1710 he was made lord steward, and in 1711 lord president of the council. After the death of Anne he held no State appointment. He died Feb. 24 1721, at his house in St. James's Park, which stood on the site of the present Buckingham Palace. Buckingham was succeeded by his son Edmund (1716-35), on whose death the titles became extinct.

Buckingham, who is better known by his inherited title as Lord Mulgrave, was the author of "An Account of the Revolution" and some other essays, and of numerous poems, among them the *Essay on Poetry* and the *Essay on Satire*. It is probable that the *Essay on Satire*, which attacked many notable persons, "sauntering Charles" amongst others, was circulated in ms. It was often attributed at the time to Dryden, who accordingly suffered a thrashing at the hands of Rochester's bravo for the reflections it contained upon the earl. Buckingham was a patron of Dryden, who may possibly have revised it but was certainly not responsible, although it is commonly printed with his works. Buckingham adapted Shakespeare's *Julius Caesar*, breaking it up into two plays, *Julius Caesar* and *Marcus Brutus*. He introduced choruses between the acts, two of these being written by Pope, and an incongruous love scene between Brutus and Portia. He was a constant friend and patron of Pope, who expressed a flattering opinion of his *Essay on Poetry*.

In 1721 Edmund Curll published a pirated edition of his works and was brought before the bar of the House of Lords for breach of privilege accordingly. An authorized edition under the superintendence of Pope appeared in 1723, but the authorities cut out the "Account of the Revolution" and "The Feast of the Gods" on account of their alleged Jacobite tendencies. These were printed at The Hague in 1727. Pope disingenuously repudiated any knowledge of the contents. Other editions reappeared in 1723, 1726, 1729, 1740, and 1753. His *Poems* were included in Johnson's and other editions of the British poets.

**BUCKINGHAM**, municipal borough and market town of Buckinghamshire, England, situated in the north-west corner of the county in the open valley of the upper Ouse, which encircles the main portion of the town on three sides. Pop. (1931), 3,082. Buckingham (Bochingeham; Bukyngham) was an important stronghold in pre-Conquest times, and was the only borough to receive separate mention in the Domesday survey. In 918 Edward the Elder encamped there with his army for four weeks and threw up two forts, one on either side of the water. There are early mentions of markets and fairs, grants by various sovereigns being numerous. Edward III. fixed here one of the staples for wool, but after the removal of all these to Calais the trade decayed so much that in an act of Henry VIII. Buckingham is mentioned among 36 impoverished towns. The town received no charter until 1554, when Queen Mary created it a free borough, and this grant remained in force until the Municipal Corporations Act of 1835. The comparative decline of Buckingham since the middle ages may be attributed to the development of the routes from London in place of the old S.W.-N.E. routes, and the consequent growth of such towns as Aylesbury, High Wycombe and Wendover, and later of Wolverton and Bletchley. From 1545 onwards until 1885 Buckingham returned two members to parliament.

The church of St. Peter and St. Paul dates from the 18th century, and stands on the site of the old castle. The grammar school was founded by Edward VI., in part occupying buildings of earlier date (part of a charity) which retain a Norman door. The town is served by branches of the L. M. S. Railway and of the Grand Junction Canal. It is a market town with agricultural trade and manufactures of condensed milk and leather.

The old industry of lace-making survives to a modified extent. The borough is under a mayor, four aldermen and 12 councillors. Area 5,006 acres. It is in the Buckingham parliamentary division.

**BUCKINGHAMSHIRE, EARLS OF.** The first earl of Buckinghamshire (to be distinguished from the earls of Buckingham (*q.v.*)) was John Hobart (*c.* 1694-1756), a descendant of Sir Henry Hobart (d. 1625), attorney-general and chief justice of the common pleas under James I., who was made a baronet in 1611, and who was the great-grandson of Sir James Hobart (d. 1507), attorney-general to Henry VII. In 1740 Hobart became lord-lieutenant of Norfolk and in 1746 earl of Buckinghamshire, his sister, Henrietta Howard, countess of Suffolk, being the mistress of George II. He died on Sept. 22 1756, and was succeeded as 2nd earl by his eldest son John (1723-93), who was member of parliament for Norwich and comptroller of the royal household before his accession to the title. From 1762 to 1766 he was ambassador to Russia, and from 1776 to 1780 lord-lieutenant of Ireland. He died without sons at Blickling Hall, Norfolk, on Aug. 3 1793, when his half-brother George (*c.* 1730-1804), became 3rd earl.

Robert Hobart, 4th earl of Buckinghamshire (1760-1816), the eldest son of the 3rd earl, was born on May 6 1760. He was a soldier, and then a member of both the English and Irish Houses of Commons; from 1789 to 1793 he was chief secretary to the lord-lieutenant of Ireland, exerting his influence in that country to prevent any concessions to the Roman Catholics. In 1793, being known by the courtesy title of Lord Hobart, he was sent to Madras as governor, but in 1798, after serious differences between himself and the governor-general of India, Sir John Shore, afterwards Lord Teignmouth, he was recalled. Returning to British politics, Hobart was called up to the House of Lords in 1798 (succeeding to the earldom of Buckinghamshire in 1804); from March 1801 to May 1804 he was secretary for war and the colonies (his family name being taken for Hobart Town in Tasmania), and in 1805 he became chancellor of the duchy of Lancaster under Pitt. For a short time he was joint postmaster-general, and from 1812 until his death on Feb. 4 1816, he was president of the Board of Control.

The 4th earl left no sons, and his titles passed to his nephew, George Robert Hobart (1789-1849), a son of George Vere Hobart (1761-1802), lieutenant-governor of Grenada. In 1824 the 5th earl inherited the Buckinghamshire estates of the Hampden family and took the name of Hampden, his ancestor, Sir John Hobart, 3rd baronet, having married Mary Hampden about 1655.

See Lord Hobart's *Essays and Miscellaneous Writings*, edited with biography by Lady Hobart (1885).

**BUCKINGHAMSHIRE** (abbreviated Bucks), a south midland county of England, bounded on the north by Northamptonshire, east by Bedfordshire, Hertfordshire and Middlesex, south by Berkshire, and west by Oxfordshire. Its area is 743.29 sq.m. The county has parts of the basins of Ouse and Thame, and reaches from the chalk Chilterns to the first outcrop of Jurassic rocks which rise in the west to form the Cotswolds, while the extreme south is drained by tributaries of the lower Thames flowing from the chalk.

Geologically it includes a succession of outcropping rocks dipping generally south-east from the Lias in the north-west to the Eocene of the London basin. The Great Oolite rises north-west of Buckingham in gentle undulations to a height of nearly 500ft. The upper portions are limestones, quarried for building stones at Thornborough, Brock and elsewhere; the lower parts are more argillaceous. A large expanse of Oxford clay, rich grass-land and famous hunting country, runs from Bicester to Bedford, including the low divide (Whaddon Chase) between the Vale of Aylesbury (mainly Kimmeridge clay) and the valleys of the Ouse and Ouzel. The clay is covered by numerous outliers of Portland, Purbeck and lower greensand beds. The upper greensand follows, and at the junction with the gault are numerous springs which have determined the sites of several villages. The chalk rises abruptly from the low-lying argillaceous plain to form the Chiltern hills. The crest-line of these hills crosses

the centre of the county from north-east to south-west at its narrowest point (111 m.), though another portion, Steps hill, is included in a loop made by the county boundary on the north-east. To the south of this line almost the whole land is hilly, the chalk outcropping and determining the form of the hills as far as Beaconsfield and Burnham. Eocene deposits, Reading beds and London clay, occupy the remaining south-east of the county. Between the Tertiary-capped chalk plateau and the Thames a gentle slope, covered with alluvial gravel and brick earth, reaches down to the river. Thick deposits of plateau gravel occur on most of the high ground in the south while much of the northern part is obscured by glacial clays and gravels which help to diversify the soil of this essentially agricultural county. To the west of Aylesbury, on the Oxford border, a few nearly isolated hills stand out, *e.g.*, Muswell hill and Brill hill (each over 600ft.), marked on the geological map by outliers of gault. The Thames forms the entire southern boundary of Bucks. The River Ouse forms various portions of the northern boundary and receives the River Ouzel flowing along the north-eastern side of the county. In the south the dip-slopes of the Chilterns are drained by the Wye, Misbourne and Chess, streams flowing to the south-east.

Traces of early man are not common in the county, though palaeolithic implements have at various times been found in the gravels of the Thames valley. Neolithic man probably inhabited the higher parts of the Chilterns, and though the numerous camps found there seem to be of the early iron age some may date farther back. The Icknield way is without doubt pre-Roman in origin. There is some indication that the Vale of Aylesbury was settled in pre-Roman times. The territory which was to become Bucks was reached by the West Saxons about 570, as by a series of victories they pushed north from the chalk of Hants and Wilts over the upper Thames. A large occupation of the chalk, such as one finds in Kent, Sussex, Berks and Wilts, is not indicated. The higher open ground was inhabited during the early part of the 7th century, as is shown by the mention of the Chiltern-Saetna, or "dwellers in Chiltern," in the tribal hidage, but it is suggested that there may have been a considerable element of native population among them. The Chronicle states that Aylesford, Bensington and Eynsham were captured by the Saxons in 571, and there is abundant archaeological evidence for their occupation of the Vale of Aylesbury. With the grouping of the settlements into kingdoms and the consolidation of Mercia under Offa, Buckinghamshire was included in Mercia until, with the submission of that kingdom to the Northmen, it became part of the Danelaw. In the 10th century Buckinghamshire suffered frequently from the ravages of the Danes, and numerous barrows and earthworks mark the scenes of struggles against the invaders. These relics are especially abundant in the Vale of Aylesbury, probably at this time one of the richest and best protected of the Saxon settlements. The Chiltern district, on the other hand, is said to have been an impassable forest infested by hordes of robbers and wild beasts. In the reign of Edward the Confessor, Leofstan, 12th abbot of St. Albans, cut down large tracts of wood in this district, and granted the manor of Hamstead (Herts) to a valiant knight and two fellow-soldiers on condition that they should check the depredations of the robbers. The same reason led at an early period to the appointment of a steward of the "Chiltern Hundreds" (*q.v.*). The district was not finally disforested until the reign of James I.

The necessity of controlling this wild Chiltern country, with its important routes from London, probably explains its inclusion within the county. The shire of Buckingham was formed by the aggregation of pre-existing hundreds as they were recaptured from the Danes. This explains the irregularities of the boundary line. As in the case of the midland counties generally, it took its name from the chief town, but it is a matter of some difficulty to understand why Buckingham should have been chosen. It was doubtless the chief town at the time; in the Domesday survey it is the only borough to receive separate mention. From the first, however, the church at Aylesbury tended to become the chief ecclesiastical centre of the county, while Buckingham never

had more than one parish and one church. The earliest churches of the county were probably subject to the West Saxon see of Dorchester; but the see was transferred to Lincoln at the Conquest, and so remained until transferred to Oxford in 1837. Of monastic foundations the Cistercian abbey of Medmenham was founded in 1201, while the Augustinian Notley abbey dates from 1162. The 18 hundreds of the Domesday survey have now been reduced to eight, of which the three Chiltern hundreds, Desborough, Burnham and Stoke, are unaltered in extent as well as in name. The boundaries of the shire have altered very little since Domesday.

The proximity of Buckinghamshire to London caused it to be involved in most of the great national events of the ensuing centuries. During the war between King John and his barons, William Mauduit held Hanslope castle against the king, until in 1216 it was captured and demolished by Falkes de Bréauté. The county was visited severely by the Black Death, and Winslow was one of many districts which were almost entirely depopulated. In the civil war Buckinghamshire was one of the first counties to join in an association for mutual defence on the side of the parliament, which had important garrisons at Aylesbury, Brill and elsewhere. Newport Pagnell was for a short time garrisoned by the royalist troops and in 1644 the king fixed his headquarters at Buckingham.

A consideration of communications is best based on the structural facts that have been outlined. Thus there are chains of villages along the water-bearing strips at the foot of the Chilterns, while it was along the Icknield way that the mediaeval traffic passed from the west of England to East Anglia. The raids of the West Saxons from beyond the Thames, and of the Angles from the Wash, were guided by similar influences, while the spread of the great diocese from Oxford and Dorchester to Lincoln is significant. The site and importance of Buckingham is probably indicative of the early use of the route on the oolite from north-east to south-west. In Roman times Watling street was built, crossing the Chilterns near Dunstable (*Durocobrivae*) in the transverse direction from south-east to north-west. Akeman street used the low route between Tring and Berkhamstead. The mediaeval, turnpike and modern roads chose the same gaps, using the Thames valley in the south and the High Wycombe, Wendover and Tring routes within the county. The main line of the L.M.S.R. uses the gap between Berkhamstead and Ivinghoe and crosses the north-east of the county. Bletchley is an important junction on this system, branches diverging north-east to Fenny Stratford and Bedford, and west to Oxford and Banbury. The pass controlled by Wendover is followed by the railway to Aylesbury and Buckingham. In the south the chief railway is the G.W. passing through Slough and Taplow. Another line uses the High Wycombe valley, passing through Princes Risborough and Beaconsfield.

There is no general manufacturing industry. Amongst those which have developed since the middle of the 19th century is boat-building, on the banks of the Thames. The thriving trade in various articles of turnery, such as chairs and bowls, carried on at High Wycombe and in its neighbourhood, is centuries old and may be attributed to the presence of the beech woods of the Chilterns.

Lace-making for a long period formed the most important industry of Buckinghamshire. Tradition attributes its introduction to Queen Katherine of Aragon who, besides holding several manors in the county, also lived for two years at Amptill. Flemish refugees, and later, French immigrants seem to have played a part in establishing the industry. The greatest period of prosperity came in the 18th century, when bone-lace was in wide demand. The trade lingered on for some time after the introduction of machine-made lace about 1835, and attempts are being made to revive it. Paper-mills have been established in the Thames valley since the close of Queen Elizabeth's reign. Of other old industries the potteries of Brill and the making of strawplait for hats may be mentioned. Newer industries include those connected with communications. The Wolverton works, belonging to the L.M.S.R., give employment to a large number of people in the neighbourhood.

The soils of the county vary greatly in different localities. On the lower lands, especially in the Vale of Aylesbury, about the headwaters of the Thames, they are extremely fertile. Beech is the predominant tree in the woods. In the south a remnant of ancient forest is preserved as public grounds under the name of Burnham Beeches (*q.v.*). There are numerous old-established private parks such as Ashridge, Biddlesden, Ditton, Stowe, Thornton and Whaddon. The Hampden estate is perhaps the most famous in the county. Of old country houses, Chequers Court dates from the late 16th century and is, since 1921, an official residence of British prime ministers. Many towns and villages have become famous for their associations with statesmen or poets, *e.g.*, Stoke Poges with Gray, Beaconsfield with Burke, and Hughenden with Disraeli. The most notable institution within the county is Eton college. Much of the county is pasture, while the Aylesbury district is famous for ducks.

The area of the ancient county is 475,682ac.; of the administrative county 479,355ac., with a population, in 1931, of 271,565. It is in the midland circuit, and assizes are held at Aylesbury. It has one court of quarter sessions, and is divided into 13 petty sessional divisions. The administrative county contains 230 civil parishes. It is entirely within the diocese of Oxford. There are three parliamentary divisions; those of Aylesbury, Buckingham and Wycombe, each returning one member. The municipal boroughs are:—Aylesbury, the county town, pop. (1931) 13,382; Buckingham (3,082); and Chepping Wycombe, also Wycombe or High Wycombe (27,987). Urban districts include Beaconsfield (4,843), Bletchley (6,169), Chesham (8,809), Eton (2,005), Linslade (2,433), Marlow (5,087), Newport Pagnell (3,957), Slough (33,530), and Wolverton (12,870). Other towns were in 1921 Amersham (C.P. 4,221), Olney (2,651), Princes Risborough (2,438), and Wendover (2,366). Several of the villages on or near the banks of the Thames have become centres of residence, such as Taplow, Burnham and Wooburn.

**BIBLIOGRAPHY.**—The original standard history is the laborious work of G. Lipscomb, *History and Antiquities of the County of Buckingham* (1831–47). Other works are: Browne Willis, *History and Antiquities of the Town, Hundred, and Deanery of Buckingham* (1755); D. and S. Lysons *Magna Britannia*, vol. i.; R. Gibbs, *History of Aylesbury* (Aylesbury, 1878–82), *Worthies of Bucks* (Aylesbury, 1886), and *Buckinghamshire Miscellany* (Aylesbury, 1891); E. S. Roscoe, *Buckinghamshire Sketches* (1891); P. H. Ditchfield, *Memorials of Old Buckinghamshire* (1901); *Victoria County History*, "Buckinghamshire."

**BUCKLAND, FRANCIS TREVELYAN** (1826–1880), English zoologist, son of Dean William Buckland, the geologist, was born at Oxford, and became house-surgeon at St. George's hospital, London, in 1852. The pursuit of anatomy led him to a good deal of out-of-the-way research in zoology, and in 1856 he became a regular writer on natural history for the newly-established *Field*, particularly on the subject of fish. In 1866 he started *Land and Water* on similar lines. In 1867 he was appointed government inspector of fisheries. Among his publications, besides articles and official reports, were *Fish Hatching* (1863), *Curiosities of Natural History* (1857–72), *Logbook of a Fisherman* (1875), *Natural History of British Fishes* (1881).

See *Life* by G. C. Bompas (1885).

**BUCKLAND, WILLIAM** (1784–1856), English divine and geologist, was born at Axminster. Educated at Tiverton grammar school and at Winchester, he was a scholar and then a fellow of Corpus Christi college, Oxford. He devoted himself systematically to an examination of the geological structure of Great Britain. In 1813, on the resignation of Dr. John Kidd, he was appointed reader in mineralogy in Oxford and was the first holder of the readership in geology. In 1818 Dr. Buckland was elected a fellow of the Royal Society, and in 1824 and again in 1840 was chosen president of the Geological Society. In 1825 he was presented by his college to the living of Stoke Charity, near Whitchurch, Hants, and in the same year he was appointed by Lord Liverpool to a canonry of the cathedral of Christ Church, Oxford. In 1825, also, he married Mary Morland, who assisted him in his literary work. In 1832 he presided over the second meeting of the

British Association held at Oxford. In 1845 he was appointed by Sir Robert Peel to the vacant deanery of Westminster, and was soon after inducted to the living of Islip, near Oxford, a preferment attached to the deanery. In 1847 he was appointed a trustee of the British Museum. He died on Aug. 24, 1856. His first great work was *Reliquiae Diluvianae, or Observations on the Organic Remains contained in caves, fissures, and diluvial gravel attesting the Action of a Universal Deluge*, published in 1823 (2nd ed. 1824). His paper on "Geology and Mineralogy," published as one of the *Bridgewater Treatises* (see BRIDGEWATER) in 1836, went through three editions, the third of which, issued in 1858, was edited by his son, Francis T. Buckland, and is accompanied by a memoir of the author.

**BUCKLE, GEORGE EARLE** (1854– ), British man of letters, was born at Twerton, near Bath, and educated at Winchester and New college, Oxford. From 1877 to 1885 he was a fellow of All Souls college. In 1880 he joined the editorial staff of *The Times*, London; four years later, while still under 30, he succeeded Thomas Chenerly as its editor. This position he occupied for more than 28 years, retiring in Aug. 1912. When Mr. Monypenny, the biographer originally entrusted with the official *Life of Disraeli*, died in 1912, leaving his task unfinished, Mr. Buckle took over the work of completing it; under his authorship vols. 3, 4, 5 and 6 were published between 1914 and 1920. Buckle also edited *The Letters of Queen Victoria*, second series (1862–78).

**BUCKLE, HENRY THOMAS** (1821–62), English historian, author of the *History of Civilization*, the son of Thomas Henry Buckle, a wealthy London merchant, was born at Lee, Kent, on Nov. 24 1821. Owing to his delicate health he was only a very short time at school. He gained his first distinctions not in literature but in chess, being reputed, before he was 20, one of the first players in the world. After his father's death in Jan. 1840 he spent some time with his mother on the continent from 1840 to 1844. He now resolved to devote all his energies to the preparation of some great historical work. By 1851 he had decided in favour of a history of civilization. The first volume, which appeared in June 1857, made its author famous. The second volume was published in May 1861. From the end of Oct. 1861 to the beginning of March 1862 he was in Egypt, from which he went over the desert of Sinai and of Edom to Syria, reaching Jerusalem on April 19 1862. After staying there 11 days, he set out for Europe by Beirut, but at Nazareth he was attacked by fever; and he died at Damascus May 29 1862.

Buckle's fame, which must rest wholly on his *History of Civilization in England*, is no longer what it was in the decade following his death. His *History* is a gigantic unfinished introduction, of which the plan was, first to state the general principles of the author's method and the general laws which govern the course of human progress; and secondly, to exemplify these principles and laws through the histories of certain nations characterized by prominent and peculiar features—Spain and Scotland, the United States and Germany. In summing up Buckle's achievement Sir Leslie Stephen said: "What he did was not to achieve new results in the sciences of history, but to popularize the belief in the possibility of applying scientific treatment to historical problems."

**BIBLIOGRAPHY.**—See A. W. Huth, *Life and Writings of Henry Thomas Buckle* (1880); and Sir L. Stephen in the *Dictionary of National Biography*.

**BUCKLER**, a shield with a boss in the centre (from old French *bocle* or *boucle*, a boss or a small round shield); now usually, but wrongly, refers to the entire shield.

**BUCKMASTER, STANLEY OWEN**, 1ST BARON (1861– ), English lawyer, was educated at Christ Church, Oxford. He was called to the bar at the Inner Temple in 1884 and took silk in 1902. In 1906 he successfully contested Cambridge in the Liberal interest. Defeated at the general election of 1910, he re-entered the House in 1911 as member for Keighley, and, in 1913, was appointed solicitor-general, being knighted in the same year. In May 1915 Sir Stanley Buckmaster was appointed lord chancellor, and he was raised to the peerage in the following month. Here he was energetic, receptive of new ideas and power-

ful in debate. In 1916 he went out of office with Asquith; but he continued to sit in a judicial capacity in the Lords. He was a strong advocate of divorce law reform.

**BUCKNER, SIMON BOLIVAR** (1823-1914), American soldier and political leader, was born in Hart county, Kentucky, on April 1, 1823. Graduating at West Point in 1844, he was assistant professor of geography, history and ethics there in 1845-46. He fought in the Mexican War, received the brevet of first lieutenant for gallantry at Churubusco, and later, the brevet of captain. In 1848-50 he was assistant instructor of infantry tactics at West Point, later in the recruiting service, on frontier duty, and in the subsistence department. He resigned in March, 1855. During the attempt of Governor Magoffin at the outbreak of the Civil War to keep Kentucky neutral he commanded the State guard; but in Sept., 1861, after the entry of Union forces into the state, he espoused the Confederate cause, becoming eventually lieutenant-general. He was third in command of Fort Donelson when General Grant attacked (Feb. 1862), and it fell to him to surrender the post with its large garrison and valuable supplies. He was exchanged in August of the same year, and subsequently served under General Bragg in the campaign of Chickamauga. He was governor of Kentucky in 1887-91, a member of the Kentucky constitutional convention of 1890, and in 1896 candidate of "Gold" Democrats for vice-president of the United States. He died in Munfordville (Ky.), Jan. 8, 1914.

**BUCKRAM**, in modern days, a coarse fabric of linen or cotton stiffened with size or glue, and used for the stiffening of parts of clothes and in bookbinding. Falstaff's "men in buckram" (Shakespeare, Henry IV., pt. I., ii. 4) has become proverbial, and the word is often used as implying a false show of strength due to artificial stiffening. The derivation is from O.Fr. *boucaran*, a coarse cloth.

**BUCKSTONE, JOHN BALDWIN** (1802-1879), English actor and dramatic writer, was born at Hoxton, London, on Sept. 14 1802. He made his first London appearance, on Jan. 30 1823, at the Surrey theatre, as Ramsay in the *Fortunes of Nigel*. His success led to his engagement in 1827 at the Adelphi, where he remained as leading low comedian until 1833. At the Haymarket, which he joined for summer seasons in 1833, and of which he was lessee from 1853 to 1878, he appeared as Bobby Trot in his own *Luke the Labourer*; and here were produced a number of his plays and farces—*Ellen Wareham*, *Uncle Tom* and others. After his return from a visit to the United States in 1840 he played at several London theatres, among them the Lyceum, where he was Box at the first representation of *Box and Cox*. As manager of the Haymarket he surrounded himself with an admirable company, including Sothorn and the Kendals. He produced the plays of Gilbert, Planché, Tom Taylor, and Robertson, as well as his own, and in most of these he acted. He died on Oct. 31 1879. He was the author of 150 plays. His daughter, Lucy Isabella Buckstone (1858-93), was an actress, who made her first London appearance at the Haymarket theatre as Ada Ingot in *David Garrick* in 1875.

**BUCKTHORN**, known botanically as *Rhamnus catharticus* (family Rhamnaceae), a much-branched shrub reaching 10 ft. in height, with a blackish bark, spinous branchlets, and ovate, sharply-serrated leaves, 1 to 2 in. long, arranged several together at the ends of the shoots. The small green flowers are regular and have the parts in fours; male and female flowers are borne on different plants. The fruit is succulent, black and globose, and contains four stones. The plant is a native of England, occurring in woods and thickets chiefly on chalk; it is rare in Ireland and not wild in Scotland. It is native in Europe, north Africa and north Asia, and naturalized in parts of eastern North America. The fruit has purgative properties; the bark yields a yellow dye.

An allied species, *Rhamnus Frangula*, is also common in England, and is known as berry-bearing or black alder. It is distinguished from buckthorn by the absence of spiny branchlets, its non-serrated leaves, and bisexual flowers with parts in fives.

Sea-buckthorn is *Hippophae rhamnoides* (family Eleagnaceae), a willow-like shrub, 1 to 8 ft. in height, with narrow leaves silvery on the underside, and globose orange-yellow fruits one-third of

an inch in diameter. It occurs on sandy seashores from York to Kent and Sussex, but is not common.

In the United States there are 12 or more native species of buckthorn, most numerous on the Pacific coast, 8 occurring in California, one of which, *R. Purshiana* yields the medicinal *Cascara sagrada* (q.v.).

**BUCKWHEAT**, the fruit (so-called seeds) of *Fagopyrum esculentum* (family Polygonaceae), an herbaceous plant, native of central Asia, but cultivated in Europe and North America; also extensively cultivated in the Himalaya, as well as an allied species *F. tataricum*. The fruit has a dark brown tough rind enclosing the kernel or seed, and is three-sided in form, with sharp angles, similar in shape to beech-mast, whence the name from the Ger. *Buchweizen*, beechwheat. In the northern countries of Europe the seeds are employed as human food, chiefly in the form of cakes, which when baked thin have an agreeable taste, with a darkish somewhat violet colour. Buckwheat is largely grown in the United States and Canada, where "buckwheat cakes" are esteemed as a cereal delicacy. As compared with the principal cereal grains, buckwheat is poor in nitrogenous substances and fat; but the rapidity and ease with which it can be grown render it a fit crop for very poor, badly tilled land. An immense quantity of buckwheat honey is collected in Russia.

In Great Britain it is not of sufficient importance to be separately distinguished in the annual agricultural returns, but it is estimated that about 1,750 ac. are devoted to its cultivation in England and Wales. It is mainly used in England for feeding pheasants, for which it is considered specially suitable, and poultry, but it is also valuable for other kinds of farm stock. The crop is sometimes sown for feeding off green by sheep, or for ploughing in as green manure.

**BUCOLICS**, a term occasionally used for rural or pastoral poetry. The expression has been traced back in English to the beginning of the 14th century, being used to describe the "Eclogues" of Virgil. The most celebrated collection of bucolics in antiquity is that of Theocritus, of which about 30 in the Doric dialect, and mainly written in hexameter verse, have been preserved. This was the name, as is believed, originally given by Virgil to his pastoral poems, with the direct object of challenging comparison with the writings of Theocritus. In modern times the term "bucolics" has not often been specifically given by the poets to their pastorals; the main exception being that of Ronsard, who collected his eclogues under the title of "Les Bucoliques." (See also PASTORAL.)

**BUCYRUS**, a city of Ohio, U.S.A. 62 m. N. of Columbus, on the watershed of the State, at an elevation of about 1,000 ft.; the county seat of Crawford county. It is on the Lincoln highway, and is served by the Pennsylvania and the New York Central railroads. The population in 1920 was 10,425; in 1930 it was 10,027. Division offices and shops of the Ohio central lines of the New York Central are situated here, and there are diversified industries, with an output valued in 1925 at \$6,081,237. Among the distinctive products are copper kettles, locomotive cranes, automobile hoists, metal mail-boxes and cabinets, manganese steel, aluminum and brass castings, children's garments, grave vaults, cotton-picking machines, road-rollers, clay and cement machinery, and hog and pig rings. The town pump, over a sulphur well dug in 1840, still stands in the public square. Bucyrus was settled in 1817; laid out in 1822; incorporated as a village and established as the county seat in 1830 and chartered as a city in 1885. It is at the intersection of the old turnpikes from Ft. Wayne to Pittsburgh and from the Ohio river to the Lakes. Its name is said to have been invented by Col. James Kilbourne, a surveyor who assisted the founder (Samuel Norton) by prefixing the syllable "bu." to suggest "beautiful," to the name of Cyrus, whom he admired.

**BUD**: see FLOWER; LEAF.

**BUDAPEST**, the capital and largest town of Hungary, is situated on both banks of the Danube and includes the former towns of Buda and O-Buda on the right bank and Pest, together with Köbánya, on the left bank. The site of the town is one of extraordinary geographical energy. The Danube has few good crossing places on its north-south course over the Hungarian

plain, and the frowning hills (770ft.), over which straggle the old fortress and town of Buda, with their steep plunge beneath the sandy plain of Pest, are conveniently approached by an intermediate step in the river, the Margaret island. Around the hills curve easy valleys leading to the fertile plain of the Little Alföld and the wooded downs of Transdanubia. Northward the Danube valley is a threshold to the mines and pastures of the

LOOKING ACROSS THE CHAIN BRIDGE (LANCHIA) FROM BUDA TO PEST. THE MOST IMPOSING OF THE BUILDINGS IS THE LEOPOLDSTADT BASILICA WITH ITS DOME 315 FT. HIGH

highlands, while the local heights are rich in building stone, lime and mineral springs. Less constricted than Esztergom and more central than either Esztergom or Székesfehérvár, the old capitals, the plain of Pest was a convenient rallying point for tribal conclaves which were protected by the marshes and by Buda. In time Buda became the outer guard of Vienna, since it commanded the gate between the Bakony mountains and the Carpathian ranges, by which that city is approached from the east.

There is evidence of settlement on the right bank during pre-Roman time. The Romans founded a colony, which they called Aquincum, a little north of the site of a previous settlement, and where O-Buda now stands. This acted as an outpost of the empire until A.D. 376, when it fell before the assaults of the barbarians. History is silent about the centuries that elapsed before the Magyar invaders approached, but it is certain that when they arrived towards the close of the 9th century they found Slavonic settlements on the present sites of Buda and Pest. (Slav. Pestj = oven; cf. the Ger. term "Ofen" for Buda.) In 1241 Pest was destroyed by Mongols, after whose departure Bela IV., king of Hungary, founded the modern Buda (1247), and repopled Pest with colonists of German and other nationalities. From this time onward both towns made rapid progress in the development of their separate functions. In 1361 Buda was selected as the capital of Hungary and henceforth gathered to itself the administrative duties while Pest looked more and more towards commerce. But neither was allowed to advance undisturbed. For centuries the rock of Buda overlooked scenes of strife between West and East, yet despite the periods of hardship, the attraction of its key position brought many compensations. Crusaders from the West brought with them the glories and advantages of 14th century French civilization. French masons and Italian artists combined to produce in Buda a city fit to rival those of the West, while Flemish and Venetian merchants raised Pest to the rank of one of the leading commercial centres of Europe. Then, in 1526, Pest was captured and sacked by the Turks, and later (1541) Buda was occupied and until 1686 controlled by Turkish pashas. Their architectural and other treasures stolen or destroyed, both towns were, at the close of this occupation, little more than ruins. But geographical site and situation, combined with historical tradition, were strong enough to overcome even this catastrophe. Stimulated by the patronage of Maria Theresa and Joseph II., revival was rapid, particularly in Pest, which in the 19th century completely outstripped Buda. In 1872 both towns were united into one municipality, Budapest, which became the political, commercial and intellectual centre of Hungary. The World War, followed by a brief period of Communist rule in 1918-19 and by Rumanian occupation and looting in 1919, brought

its development to a standstill. The conclusion of peace caused an influx of thousands of refugees and unemployed officials from the lost Hungarian territories and resulted in much unemployment and a serious housing shortage. The milling industry, the greatest in Europe, upon which the city depended so heavily, was almost ruined by the high import duties upon grain entering Hungary and the difficulty of establishing relations with former customers. Further, since Budapest shared with Vienna the financial control of south-east Europe, the loss of this side of its commercial life brought ruin to many. The position began to improve after the financial reconstruction of 1924 and as a result of the action of the international committee of enquiry that met at Basle in Jan. 1925 to examine the financial position of the city in the interests of its bondholders.

The modern town covers an area of about 80sq.m., on both sides of the river, which varies in width from 300 to 650 yards. The two banks are connected by six bridges, which include one of the largest suspension bridges in Europe. In almost direct continuation of one end of this bridge a tunnel 383yd. long pierces the hill on which the castle of Buda is built.

Buda, though of ancient origin, resembles Pest in its lack of buildings of historic and architectural interest. Both convey the impression of comparatively recent creation but the peace of Buda produces an appearance of old-world quietude that is a pleasing contrast to the bustle of its busy partner. Shabby, yellow-plastered houses, with here and there odd reminders of earlier glories in the shape of old arches and simple inscriptions commemorating the residence of by-gone notabilities, linger in the shadow of grandiose buildings in the ostentatious style that characterized the architecture of Budapest during the wave of construction that swept over it during the closing decade of last century. Reconstructions during the course of time to replace the ravages of war have failed to capture the spirit of continuity. Yet Buda has impressive buildings that are not without inspiration for its citizens. The plateau, which is approached by road, by terraced walks or by funicular railway, is crowned by the citadel and royal palace. Erected in 1748-71, it was partially destroyed by fire in 1849 but restored and enlarged in 1894-1905. The palace now contains 860 rooms, many of them furnished and decorated with great magnificence. A short distance away rises the coronation church, begun by King Bela IV. in the 13th century in Romanesque style and completed in Gothic by King Matthias Corvinus in the 15th century. After a period of service as a mosque during the Turkish occupation it lost some of its importance but regained it following the coronation there of Francis Joseph, and it was thoroughly restored in 1873-96. Behind the church is a fine bronze equestrian statue of King Stephen the Saint, which, situated near the edge of the plateau, overlooks the Fisher bastion and ramparts that terrace the slope. In Buda, too, are situated some of the larger curative baths for which the city is famed; these are at the base of the Blocksberg, where hot thermal springs (115°) gush from the limestone beds.

Standing on the heights of Buda, at the threshold of the huge Hungarian plain, the whole extent of Pest opens in a magnificent panorama. Below, hugging the hills, runs the Danube, broken by Margaret island with its baths, hotels and pleasure resorts, and bordered on the left bank by broad quays and on both banks by wide embankments; here human construction has been worthy of the greatness of the river. Lining the river on the left bank is a long range of imposing buildings, including the houses of parliament, a large late Gothic edifice erected in 1883-1902, the academy, in Renaissance style, the larger hotels and the Custom house. Beyond the left embankment, which stretches for a length of 2½m., the old "inner town" of Pest is the nucleus of the city. Built on a slight elevation, sufficient in earlier times to give protection from flood, it is the shopping centre and is encircled by wide boulevards, the Belső körút or inner circle, on the site of the old walls. From it streets radiate like the spokes of a wheel, while built around this inner town is the new Pest, a vast number of large dwelling-houses and public buildings intersected by two other semicircular girdles commencing and ending at the Danube, the Nagy körút or large circle and the Külső körút or outer circle,

beyond which lie the manufacturing districts. Narrow cobbled streets, broad acacia-bordered boulevards, wide squares, lined with substantial buildings and dotted with gardens and monuments, all contribute to the grandeur of one of the most beautiful capitals of Europe.

Pest, too, has its fine buildings. Apart from those already mentioned the most striking in the town are the Basilica church, a Romanesque building with a dome 315ft. in height, the opera house, in the Italian Renaissance style, the redoute buildings, in mixed Moorish and Romanesque styles, the university and the palace of justice, all of these dating from the latter half of last century. Amongst the many other fine buildings may be mentioned the agricultural museum, the museum for fine arts and the national archives.

The finest thoroughfare in Budapest, the Andrássy avenue, runs in a straight line from the centre of the city to the city park, which is entered by way of the millenium monument, a semi-circular pillar-colonnade, housing statues of the Hungarian kings and allegoric bronzes with, in the centre, a column, 117ft. high, surmounted by a statue of the archangel Gabriel. The city park (Városliget), covers 240ac. and is the centre of a vast system of amusements. In close proximity to it lie several museums, the zoological gardens and other smaller parks.

In many other directions Budapest has endeavoured to escape from the overshadowing influence of Vienna and to act as the real centre of inspiration for its country. Part of the scheme involved a strenuous effort to keep its students at home, and for this purpose numerous educational institutions of all types and grades were established. At the head is the Pázmány university with a staff of 321 and some 6,000 students. After it ranks the technical high school with a staff of 120 and about 3,000 students. The city also possesses an adequate number of elementary and secondary schools with a great number of special and technical schools. Scientific and literary societies are headed by the Academy of Sciences, founded in 1825, the Kisfaludy society (1836) and the Petöfi society (1875); the last two aim at the preservation of the Hungarian language and folklore. Other active associations of peculiar significance are the central statistical department, the communal bureau of statistics and the Hungarian sociographical institute. The natural love of music is furthered by the academy

tion from Hungarian regions. Thus, while in 1880 the population was 355,682, of whom 56.7% were Magyars, 34.4% Germans and 6.1% Slovaks, the corresponding figures for 1920 were as follows:—928,996, 90.2%, 6.5%, 1.5%. The first step in the movement to rival Vienna was made in 1848 when Budapest became the seat of the legislature, and the promotion of its interests has been an integral feature of the policy of government. Consolidation of the political supremacy is the accomplishment of the Magyar aristocracy but the commercial and industrial leadership is the work of the Jews. The post-war years have been marked by an extraordinary display of anti-Semitic feeling quite opposed to the original attitude of toleration customary in the city. The old passionate expressions of national feeling, too, are now less often heard, the city is more subdued and its energies are bent towards restoration rather than expansion. New industries, notably textiles and chemicals, are rising to replace the older basic occupations of milling and steel-working. Other industries of importance are brewing, distilling and the manufacture of tobacco and leather goods. As a trading centre Budapest owes its importance to an energetic utilization of its natural advantages by the Hungarian Government. The trade of Hungary (*q.v.*), primarily an agricultural country, in stock, cereals, wines, hides and wool is handled on exchanges situated in the capital. To it much of the produce passes by road or river for redistribution and the Government's assistance to industrial undertakings has always been controlled by an effort to locate the principal activities in Budapest. A zone system of railway development focussing on the capital has fostered this concentration.

Figures given above supply some indication of the phenomenal growth of the city during the last half-century. Only Berlin has surpassed Budapest in this direction, and the rate of increase during the first 90 years of last century was nearly two-and-a-half times that of London. Budapest may, despite its large Jewish population, be said to express faithfully the spirit of Hungary. It has grown as a concrete expression of the national consciousness under the inspiration of such notable reformers and patriots as Count Stephen Szechenyi and derived great benefits from the diverse elements in its population. For the moment, like Vienna but to a lesser degree, it suffers by its size in comparison with the reduced territory it serves. Strenuous efforts to overcome the resultant difficulties are being made, notably in the direction of attracting foreign visitors. Its virtues as a health resort and centre for tourists are increasingly advertised, and it will be well for the future of Budapest if such contacts can be made. For the city can fulfil an important function in European and world civilization. Given the correct outlook, the rock of Buda may yet recover its attraction for the South and East, but this time as a natural and convenient centre for peaceful commercial and cultural intercourse. (*See HUNGARY.*)

FRANZ JOSEF QUAI, THE MOST IMPORTANT OF THE LONG STRETCH OF QUAYS THAT FRONTS THE PEST SIDE OF THE DANUBE, AND IS LINED WITH MANY IMPOSING BUILDINGS

of music, of which Liszt was at one time director, and in addition the Government maintains schools of drama and painting.

The growth of Budapest and the development of its cultural aspects has been most rapid since the *Ausgleich* with Austria in 1867. Since then centralization has been the watchword of the awakened national consciousness of Hungary. To that ideal transport, manufacture, trade and intellectual opportunities have been subordinated. The capital has little competition to meet from regional centres within the country. In fact it has grown at their expense and its composite population has become nine-tenths Magyar by absorption of non-Hungarian and by immigra-

**BUDAUN**, a town and district of British India, in the Rohilkhand division of the United Provinces. The town is near the left bank of the river Sot. Pop. (1921) 39,118. There are ruins of a powerful fort; and a handsome mosque of imposing size, crowned with a dome, and built in 1223, from the materials of an ancient Hindu temple, has recently been restored. According to tradition Budaun was founded about A.D. 905. After its capture by Kutb-ud-din in 1196 it became a very important post on the northern frontier of the Delhi empire. In the 13th century two of its governors, Shams-ud-din Altamsh, the builder of the great mosque, and his son Rukn-ud-din Firoz, attained the imperial throne. In 1571 the town was burnt, and about a hundred years later, under Shah Jahan, the seat of the governorship was transferred to Bareilly. It ultimately came into the power of the Rohillas, and in 1838 was made the headquarters of a British district.

The District of Budaun has an area of 2,014 sq.miles. Pop. (1921) 975,347. The country is low, level, and generally fertile, and is watered by the Ganges, the Ramganga, the Sot or Yarwafadar, and the Mahawa. Budaun district was ceded to the British Government in 1801 by the nawab of Oudh. There are several indigo factories.

**BUDDEUS, JOHANN FRANZ** (1667–1729), German Lutheran divine, was born on June 25, 1667, at Anklam, Pomerania, where his father was pastor. He studied at Greifswald and at Wittenberg, was appointed professor of Greek and Latin at Coburg in 1692, professor of moral philosophy at Halle in 1693, and in 1705 professor of theology at Jena. In 1715 he became Primarius of his faculty and member of the Consistory. He died at Gotha on Nov. 19, 1729.

His principal works are: *Leipzig, allgemeines historisches Lexikon* (Leipzig, 1709 ff.); *Historia Ecclesiastica Veteris Testamenti* (4 vols., Halle, 1709); *Elementa Philosophiae Practicae, Instrumentalis, et Theoreticae* (3 vols., 1697); *Selecta Juris Naturae et Gentium* (Halle, 1704); *Miscellanea Sacra* (3 vols., Jena, 1727); and *Isagoge Historico-Theologica ad Theologiam Universam, singulasque ejus partes* (2 vols., 1727).

**BUDDHA and BUDDHISM.** Buddhism is the religion of the followers of Gautama Buddha, which formerly covered a large area in India, and is still widely spread in Ceylon, Burma, Siam, Cambodia, China and Japan. It arose in the 6th century B.C., as an offshoot of the prevailing Hindu religion of north India, in what is now approximately Bihar, west of Bengal. There are no historical records of this period, and our whole knowledge rests upon the religious documents of prebuddhistic Hinduism and on references in the Buddhist scriptures. Hinduism was then a polytheistic system possessing collections of sacred books, the Vedas and Brāhmaṇas. It had been developed in the hands of the priests into an elaborate sacrificial and ritual system, to which was adapted the social theory of caste (*q.v.*), with the priestly caste of brahmins claiming primacy over the rest. In the Upanishads, the latest development of the Vedic literature, there had already appeared the beginnings of a pantheistic philosophy, which sought a single reality behind all individual gods, and aimed at salvation not in the performance of ceremonies, but in the attainment of union with this reality.

Buddhism was only one of the protests which appeared at this time against the prevailing formalism. Ethically it sought reform in rejecting the authority of the Vedas and in teaching an independent morality, and philosophically in denying any permanent substratum in the world or in any of the gods of the Vedic pantheon. Independently of all such theories it offered a way for the attainment of salvation, which was set forth as being the discovery of the founder.

**Authorities.**—A large number of official documents exist as the Buddhist scriptures, purporting to record the exact teaching of the founder, but they all have been put into their present form after the split up of the community into sects. Only one of these collections now exists in completeness in any Indian language, the Canon of the Theravādins, "the school of the Elders," in Pāli, which still flourishes in Ceylon and further India. It owes its preservation to the fact that it was introduced into Ceylon by Buddhist missionaries in the 3rd century B.C. Thence it spread to Burma and Siam. It is held to have been reduced to writing in Ceylon, early in the 1st century A.D. Variant forms of the Canon, as it existed in other schools, are known from Chinese translations, and the chief divergences from the Pāli collection appear to be not doctrinal, but due to the fact that the records were preserved for centuries by memorizing, and that differences of arrangement and tradition arose inevitably between widely separated communities of monks. It is certain from the Pāli that there were various sects, which all appealed to the same authoritative records.

In all the older schools the Canon exists in a threefold division, the Tri-piṭaka, "the threefold basket." This consists of (1) the Vinaya-piṭaka, a collection of the 227 rules of discipline (*vinaya*) binding on the monks. The four most fundamental of these rules, violation of which involved expulsion from the Order, are those which forbid unchastity, theft, taking life or inciting to suicide, and making a false claim to supernormal powers. A second set of rules follows dealing with the organization of the several communities, and a commentary now reckoned as canonical accompanies the whole. (2) The most important section for doctrine (*dhamma*) is the *Sutta-piṭaka*, arranged in five collections of suttas or discourses called Nikāyas, or in some schools Āgamas.

The first four Nikāyas are common to all the older schools. They consist chiefly of discourses attributed to the Buddha, but among them are included poems, legends, dialogues, and commentaries, and a number of them are ascribed to disciples. They are classified not according to any doctrinal principle, but chiefly with a view to convenience in their being learnt by heart. The first two, the *Dīgha-nikāya* "collection of long suttas," and the *Majjhima-nikāya*, "collection of middling long suttas," are arranged according to length, and subdivided with a slight reference to subject-matter. The third, the *Samyutta-nikāya*, "collection of connected suttas," is arranged in groups according as they are addressed to certain classes of people or individuals. In the fourth, the *Anguttara-nikāya*, the arrangement is numerical, as the Nikāya begins with a list of individual things, which is followed by lists of pairs, of threes, etc., up to groups of 11 things. The fifth, the *Khuddaka-nikāya*, "collection of minor works," is not recognized by all schools, but some of the contents are very old, and much of it exists in schools which do not possess the Nikāya as a whole. In the Pāli Canon it consists of 15 works, and among the most important items are the *Dhammapadam*, "words of the Doctrine," a collection of 423 verses, the *Sutta-nipāta*, five books of suttas in verse, which also contains important legendary material, the *Jātaka* (*q.v.*), stories of the Buddha's previous births, and two collections of verses attributed to disciples, the *Theragāthā*, "verses of elders" and *Therīgāthā*, "verses of women elders." (3) The third Piṭaka, the *Abhidhamma* (*q.v.*), "higher doctrine," deals chiefly with psychological ethics, and consists in the Pāli Canon of seven works. Similar, but so far as known, not identical works existed in other schools.

A BUDDHIST PRIEST ATTENDED BY HIS ACOLYTE

**Chronology. Life of the Founder.**—The Canon itself contains no chronological data. The basis of the usual computation is found in the *Dīpavamsa*, a Pāli chronicle of the 4th century A.D., which gives a list of Indian (Magadha) kings from the time of the Buddha down to Asoka, king of Magadha in the 3rd century B.C. It is from this list that the date 544 B.C. has been fixed by the Ceylon Buddhists as the date of the Buddha's death, but the chronicle contains another date—218 as the number of years elapsed after the Buddha's death, at the time when Asoka was consecrated king. This according to Geiger's calculation gives the more probable date 483 B.C., and the calculations of other scholars differ by only a few years. Internal evidence (references to Hindu mythology, to the rival system of Jainism, and to political conditions) also indicates a period not later than the 5th century B.C. The dates recorded by the Buddhists of Tibet and China differ widely from this and from one another, and seem to indicate that no real tradition has survived in those schools.

Except for isolated incidents the life of the Buddha is found only in post-canonical works and in works of Sanskrit schools.<sup>1</sup> They all agree that he was the son of a king of the Sakyas (Sākyas), a people of the warrior caste settled near the Himalayas and north of the Kosala kingdom, who claimed to belong to the Gautama clan (hence his clan name of Gautama); that as it had been prophesied at his conception that he would renounce the world on seeing a sick man, an old man, and a corpse, he was brought up in luxury, but left his home at the age of 29, and after six years of effort attained enlightenment under a tree (*see* Bo-tree) at Gayā in Magadha (hence his title Buddha, "the enlightened"); that he then formed an Order of monks, to which during his lifetime an Order of nuns was added, and spent the rest

<sup>1</sup>The most important are the Pāli introduction to the Jātaka (*see* JĀTAKA), Tibetan translations from the Sanskrit collected in Rockhill's *Life of the Buddha*, and in Sanskrit the *Lalitā-vistara*.

of his life as a wanderer preaching his newly discovered doctrine (*dhamma*) not only to the monks but to the laity generally, and died at the age of 80.

The legend of Buddha's early life has been explained by Senart and Kern as mythology—the historicizing of ancient mythological beliefs concerning astronomical and other natural phenomena. But even these scholars admitted the historical existence of the Buddha, and merely sought to explain the stories concerning him according to mythological theories. Their theories are not now generally accepted, but it is evidently impossible to determine what exact amount of fact there may be in an uncorroborated legend teeming with miracles, which refers entirely to a prehistoric period. For the end of the Buddha's life we have an account in the Canon of several schools, the *Mahā-parinibbāna-sutta*. Although not a contemporary record, it was evidently compiled when the locality of the events was known, and when the sacred sites were places of pilgrimage. Przyluski, who has analysed the recensions of this sutta preserved in Chinese and Tibetan translations, discredits the view that the Pāli represent the most primitive account (see *Journ. Asiatique*, 1918, 1919).

**Doctrines.**—In the Canon occurs a sutta which is traditionally believed to be the first exposition of the doctrine, preached by the Buddha when he began his mission at Benares, the *Dhammacakkapavattana-sutta*, "the sutta of turning the wheel of the doctrine." It has remained even in the latest schools an exposition of the fundamental teaching regarding the goal of the disciple and the conditions for attaining it, even when in some cases it has been overlaid by additional dogmas.

The sutta is addressed to "him who has gone forth from the world" in the conviction that worldly life cannot give final happiness, and it repudiates two extremes which he ought not to follow—the profitless life of indulgence in sensual pleasure, and the equally profitless way of self-torture. The Middle Way, which "conduces to enlightenment and Nirvāṇa," has been won by the Tathāgata (the Buddha), and enlightenment consists in the knowledge of the four Truths. The first Truth is the noble truth of pain: "birth is pain, old age is pain, sickness is pain, death is pain . . . in short the five aggregates of grasping are pain." The second is the noble truth of the cause of pain, and this is the craving (*tanhā*, thirst) that leads to rebirth, "the craving of the passions, the craving for (continued) existence, the craving for non-existence." The third is the noble truth of the cessation of pain, consisting in "the remainderless cessation of craving, its abandonment and rejection, emancipation, and freedom from support." These are the three truths knowledge of which constitutes the state of the arhat, the perfected disciple who has reached the goal of the cessation of pain. The fourth Truth consists in the actual means of arriving at these truths, the Noble Eightfold Path: "right views, right intention, right speech, right action, right livelihood, right effort, right mindfulness, right concentration." This description of the Path covers the whole training of the disciple, and its significance is best seen from the way in which it is developed in the suttas. It includes a theoretical part (right views), a system of ethical practice, and a method of mental training expressed in right effort, mindfulness and concentration.

Positively the only right views required are the four Truths, but from the first Buddhism stood in opposition to rival systems, and thus was compelled to take up a definite attitude on various points. Against both Hinduism and Jainism it denied a permanent self (*ātman*), and it analysed the individual into five groups of elements, which are referred to in the first sermon as the five aggregates of grasping (body, feelings, perception, mental elements, consciousness). This analysis, as well as the usual analysis into mind and body (*nāma-rūpa*), is merely a description of facts. But Buddhism is peculiar in going further and denying that there is anything beyond these elements as constituting the individual, and this attitude has always been one of the most vulnerable points of the system. It met with attacks from the defenders of the *ātman* theory, and it was troubled by the development of heretical views among its own members, who sometimes attempted to find a principle which would explain why an individual exists at all. The doctrine of non-self is from another point of view the

doctrine of the impermanence of compound things, and in this form it was applied to all existent beings including the gods, who were held to be liable to the effects of karma and transmigration. On the other hand Buddhism sided with Hinduism in its opposition to the sceptical doctrine of the annihilation of the individual at death (*ucchedavāda*), and it accepted the doctrine of transmigration. The individual transmigrates until the aggregates that compose him are finally disintegrated with the cessation of craving.

Four questions are recorded which it was held that the Buddha had refused to answer. These are, whether the universe is eternal or not, whether it is finite or not, whether life is the same as the body, and whether one who is emancipated (a Tathāgata) exists after death. These are the undetermined questions, and the fact that they were left unanswered has led to the system being called agnostic. The last question is important with regard to the meaning of Nirvāṇa. Nirvāṇa, "blowing out," is the extinction of craving or passion, which is reached when the disciple attains the knowledge of the Truths and is emancipated. This state may be reached during lifetime, and it is affirmed quite explicitly in the fourth undetermined question, that the Buddha has not explained whether one who is thus emancipated exists after death. Nevertheless modern scholars have attempted to guess. Oldenberg once inferred that the Buddha knew that final annihilation of the individual was the logical result of his teaching, but that he did not wish to discourage disciples by saying so. Later on Oldenberg held that there are traces which indicate a belief in an absolute as highest aim, "a universal being stretching infinitely far beyond the limits of the individual." But Oldenberg's change of view shows how precarious the evidence is. Whatever may have been in the mind of Buddha, there is no doubt that the recognized teaching came to be that the answer had been left undetermined.

The doctrine of the origin of pain became formulated in the well-known Chain of Causation (*paṭicca-samuppāda*). This is a list of 12 causal states of the individual, each of which is supposed to determine the next: ignorance, mental elements, consciousness, mind and body, the six senses, contact, feeling, craving, becoming, birth, old age and death. There have been many explanations of this formula. The usual Buddhist interpretation has been well set forth by S. Z. Aung and Mrs. Rhys Davids (*Compendium of Philosophy*, 1910) but as there are several variant formulas in the Canon, it is impossible to prove that the form with 12 links is primitive, and no one has ever shown that it has any philosophical value among theories of causation.

The ethical teaching has a significance far beyond the actual rules imposed on the monks. For the Order the rules formed a definitely ascetic system with all the liabilities to corruption that beset such attempts to reconstruct human nature. But the teaching concerning non-injury, forgiveness of enemies, and friendliness to all was a revelation of ethical ideals that went beyond any system. Ethics were further purified by the separation of moral rules from prescriptions of merely ritual significance. It was an enormous stride forward in ethical theory to make motive the criterion of moral action, instead of judging goodness by the sum total of good or bad actions performed.

This ethical reformation further resulted in moralizing the doctrine of karma, which, along with the doctrine of rebirth, had been taken over from Hinduism. Karma (*g.v.*) no longer meant a due number of sacrifices and gifts to brahmins. It is true that the thought of retribution implied in karma does not supply the highest motive for moral action, but at least it was to moral action that the theory was definitely applied, not to mere ritualism, and the theory that every action received its punishment or reward could be made plausible when several lives were allowed for retribution to take place.

The chief end of the disciple being not morality but knowledge, the practice of the Eightfold Path culminated in concentration or mystic meditation (*samādhi*). Concentration is essentially the same as the Hindu practice of Yoga, and it holds such a prominent place in the early suttas that Senart has described Buddhism as a branch of the Yoga system. It consists in fixing the attention on one chosen point or subject, so that the mind passes through different stages of absorption or self-hypnotization (trance). In the

older suttas only four stages of trance (*jhāna* or *dhyāna*) are described. Later on four or sometimes five stages called attainments are added, and in post-canonical works, especially Buddhaghosa's *Way of Purity*, the methods and subjects of meditation have been much elaborated. In modern Pāli Buddhism they have largely fallen into disuse, but in China and Japan the developments that took place in Sanskrit Buddhism have been preserved and even extended. The practice of concentration is probably pre-Buddhist, and in Buddhism it appears to have been employed from the very first, but it is impossible to ascertain how much may have been borrowed from orthodox Yoga, as all the documents of this system belong to a later period.

The Eightfold Path is essentially a course of training, and in order to carry it out fully and extinguish craving the abandonment of a household life is essential. This career is expressed in the organization of the Sangha, the assembly or Order of monks. The rules of the Order, which are essentially the same in all the older sects, have been subject to additions, but two of the most important ceremonies are no doubt primitive, the assembly of *uposatha*, at which the *Pātimokkha*, the list of offences given in the Vinaya, was recited each fortnight and confession of any infringement required, and secondly the practice of Retreat (*vassa*), during the three months of the rainy season, when travelling was forbidden. The elaborate rules for admission of members, the internal regulations of the monasteries, and discipline, will be found in the second part of the Vinaya, and have been translated in *Vinaya Texts*.

Since the publication of the texts of the Pāli Canon there has been agreement on main points concerning the doctrine which they set forth. We know that already in the 3rd century B.C. there were other schools, and we know something of their tenets, but the differences so far were on minor points, and it is unlikely that the canonical texts diverged seriously. But in recent years it has become more clearly recognized that the Pāli Canon cannot be taken to be the doctrine in its primitive form. As it stands it is only the doctrine as it had become formulated in one school two centuries later. Hence there have been attempts to reconstruct the supposed primitive teaching of the founder. It is the view of Prof. de la Vallée Poussin that besides the official doctrine contained in the Scriptures there was a popular Buddhism, which soon made a god of the Buddha. Such a development among the laity is very probable, and it may be one of the factors that contributed to later Mahāyāna developments. According to Mrs. Rhys Davids the denial of the ātman, which is so much reiterated in the Canon, was not original, nor was the system primarily a monastic institution as we find it in the Vinaya. Dr. Paul Dahlke still finds that the pure Buddha-word is that which is laid down in the Pāli Canon. On these still disputed questions the works mentioned below must be consulted.

**Later History.**—The Chronicles record three councils, the first immediately after the Buddha's death (483 B.C.), at which the Scriptures, the Dhamma (Sutta) and Vinaya, were recited, the second a century later, when ten violations of monastic discipline were condemned and the first schism occurred, and the third in the reign of Asoka (247 B.C.). Although it is probable that the three councils were actually held, nothing properly historical is known about them. It is significant that while in Sanskrit works there are frequent references to Asoka, there is no mention of him in the Pāli Canon. This makes it probable that in the Pāli we possess the Canon as it was already settled in the time of Asoka. In the inscriptions of Asoka we have evidence of his support of the doctrine and of its spread over India. From the chronicles we learn that in Asoka's reign the doctrine was introduced by his son Mahinda into Ceylon.

The further history of the Theravādins is confined to Ceylon, and does not show any development in doctrine. For the later history of Buddhism in India the first authorities are the accounts of the Chinese pilgrims, chiefly Fa Hien in the 4th century and Hiuen Tsiang in the 7th. They found that Buddhism had extended into Central Asia, and they speak of the 18 schools as still existing in India, but they also refer to two great divisions, the Great and Little Vehicle. The Great Vehicle is the Mahāyāna,

the new development of doctrine which showed itself from the 1st century, and which stigmatizes the older schools as Hinayāna, "low vehicle." (For this development see MAHĀYĀNA.) From Hiuen Tsiang we get a glimpse of the great importance of schools not recognized by the Theravāda. Kanishka, the Saka king of Gandhāra in the 1st century, being displeased at the contradictory teachings of various schools, caused a general council to be held. This council not only arranged the three Piṭakas, but is also held to have composed commentaries thereon. The Sanskrit schools reckon it as the third general council, and ignore the Council of Patna, which for the Theravāda is the third.

The cause of the decline of Buddhism in India has been supposed to be persecution. There is no real evidence for this, though there is one passage in which persecution is asserted. An examination of the latest Buddhist works makes it clear that the system gradually approximated to the surrounding Hinduism. The Buddhas were multiplied and divinized. Bodhisattvas were exalted and worshipped as the givers of merit, and female consorts were attributed to them, so that they became indistinguishable except in name from the manifestations of Siva and Krishna.

**Modern Research.**—The striking archeological discoveries of the last century have both confirmed and added to our knowledge, chiefly concerning the period of the great extension of the religion under Asoka. First among these come the inscriptions on rocks and pillars put up by Asoka after his conversion. The legend of his pilgrimage to the birthplace of Buddha in the Lumbini garden is borne out by the discovery in 1896 of a pillar within the borders of Nepal which he caused to be set up in record of his visit. Another pillar, found the year before in the same region, records his visit to the stupa of Konāgamana, a previous Buddha. But the most surprising find was made in 1898 by W. Peppé, who discovered near the Nepal border a stupa containing five vessels. One of these was a stone vase with a circular inscription in verse and in letters of the Asokan period, and containing fragments of bone, and other relics. The translation by Prof. Lüders (modified owing to the revised order in which it is to be read) is: "*Of the brothers Sukiti, jointly with their sisters, with their sons and their wives, this (is the) receptacle of the relics of Buddha, the holy one, of the Sakyas.*" Owing to a mistranslation it was once held to be the share of the relics given to the Sakyas after the cremation of Buddha's body. But this deposit was evidently made by a single family, and it is not likely to be earlier than the age of Asoka. Other relics of a still later date have since been found in north-west India. The discovery of Buddhist remains in Chinese Turkestan through the expeditions of Sir Aurel Stein and von Le Coq has shown the wide spread of Buddhism in Central Asia among peoples and in languages that have now disappeared. But they belong entirely to post-Christian times, and chiefly throw light on the latest stages of Buddhism.

**BIBLIOGRAPHY.**—*Texts:* The Pāli Text Society has issued the *Sutta-piṭaka* (except *Jātaka*) and *Abhidhamma* (see JĀTAKA, ABHIDHAMMA); *Vinaya*, ed. **BUDDHAGHOSA**, a celebrated Buddhist writer, was a Brahman by birth and was born at Budh Gayā in north India about A.D. 390. His teacher, Revata, induced him to go to

Ceylon, where the commentaries on the Scriptures had been preserved in the Sinhalese language, with the object of translating them into Pāli. He went accordingly to Anurādhapura, studied there under Sanghapāla, and, with the leave of the fraternity, translated the commentaries. The *Visuddhi Magga* (the Path of Purity, a lengthy summary of Buddhist doctrine) is one of his earlier works. When he had completed his labours he returned to the neighbourhood of the Bodhi tree in north India. Before he went to Ceylon he had already written a book entitled *Nānodaya* (the Rise of Knowledge), and had commenced a commentary on the principal psychological manual contained in the *Pitakas*. This latter work he afterwards rewrote in Ceylon. As the original commentaries in Sinhalese are now lost his voluminous works are the only evidence we have of the traditions then handed down in the Buddhist community. The main source of our information about Buddhaghosa is the *Mahāvamsa*, written in Anurādhapura about 50 years after he was working there. But there are numerous references to him in Pāli books on Pāli literature; and a Burmese author of unknown date, but possibly of the 15th century, has compiled a biography of him, the *Buddhaghos' Uppatti*, of little value and no critical judgment.

See *Mahāvamsa*, ch. xxxvii. (ed. Turnour, Colombo, 1837); "Gandhavamsa," p. 59, in *Journal of the Pāli Text Soc.* (1886); *Sumangala Vilāsinī*, edited by T. W. Rhys Davids and J. E. Carpenter, vol. i. (Pāli Text Soc., 1886); *Buddhaghosuppatti* (text and trans. ed. by E. Gray, 1893).

#### BUDDHIST LAW: see INDIAN LAW.

**BUDÉ (BUDAËUS), GUILLAUME** (1467–1540), French scholar, was born at Paris. The work which gained him greatest reputation was his *De Asse et Partibus* (1514), a treatise on ancient coins and measures. He was held in high esteem by Francis I., who was persuaded by him, and by Jean du Bellay, bishop of Narbonne, to found the Collegium Trilingue, afterwards the Collège de France, and the library at Fontainebleau, which was removed to Paris and was the origin of the Bibliothèque Nationale. He also induced Francis to refrain from prohibiting printing in France, which had been advised by the Sorbonne in 1533. He was sent by Louis XII. to Rome as ambassador to Leo X., and in 1522 was appointed *maître des requêtes* and was several times *prévôt des marchands*.

Budé was also the author of *Annotationes in XXIV. libros Pandectarum* (1508), which had a great influence on the study of Roman law, and of *Commentarii linguae Graecae* (1529), an extensive collection of lexicographical notes, which contributed greatly to the study of Greek literature in France. He corresponded with the most learned men of his time, amongst them Erasmus and Thomas More. He was suspected of leanings towards Calvinism. Other works of his are *De Philologia* (1530), *De Transitu Hellenismi ad Christianismum* (1534) and *De l'Institution du Prince* (pub. 1547).

See Le Roy, *Vita G. Budaei* (1540); Rebitté, *G. Budé, restaurateur des études grecques en France* (1846); E. de Budé, *Vie de G. Budé* (1884), who refutes the idea of his ancestor's Protestant views; D'Hozier, *La Maison de Budé*; L. Delaruelle, *Études sur l'humanisme français* (1907); *Répertoire analytique et chronologique de la correspondance de G. Budé* (1907); J. E. Sandys, *History of Classical Scholarship* (1908), vol. ii. pp. 170–173, with bibliography; J. Plattard, *Guillaume Budé* (1923).

**BUDE**, a small seaport and watering-place of Cornwall, England, on the north coast at the mouth of the river Bude. With the market town of Stratton, 1½ m. inland to the east, it forms the urban district of Stratton and Bude, with a population (1931) of 3,836. The coast scenery in the neighbourhood is fine, especially towards the south, where high cliffs, with banded strata, have been broken into fantastic forms by the waves. Many ships have been wrecked on the jagged reefs which fringe their base. The harbour, sheltered by a breakwater, will admit vessels of 300 tons at high water; and the river has been dammed to form a basin for the canal which runs to Launceston. Some fishing is carried on; but the staple trade is the export of sand, which, being highly charged with carbonate of lime, is much used for manure.

Bude is served by a branch of the Southern railway. Its only notable building is the Early English parish church.

**BUDĚJOVICE**, a town of Bohemia, Czechoslovakia, situated at the confluence of the Malše and the Vltava, which here becomes navigable. Founded in the 13th century by Budivoj Vitkovec, it later became a royal city and figured largely in Bohemian history during the 15th, 16th and 17th centuries, being granted many privileges in return for its allegiance to the royal cause. In 1783 it became the see of a bishop and was highly Germanized, but the Czech element has increased rapidly and now forms 80% of the population (1921—44,022). The town is noted for its fine square surrounded by imposing, arcaded buildings, the principal one being the town-hall built in 1730 in Renaissance style. The modern prosperity is bound up with the fact that it is the commercial centre of southern Bohemia, an important railway junction and a river port, with a large and varied development of manufactures, notably clay, timber and chemical products, beer, blacklead pencils and machinery, based in the main upon local resources of lignite, iron and other raw materials.

**BUDENNY, SIMEON MIKHAILEVICH** (1876– ), Russian soldier, was born in southern Russia, the son of a farmer of the Cossack country. He entered the Russian army in 1903 and rose to be a non-commissioned officer. In 1917, after the revolution, he was elected president of the divisional soviet of the Caucasian troops. He did not join the Communist Party until 1919, but soon after the beginning of the civil war found himself in conflict with the Whites and, with only a few friends and relations began to wage guerrilla warfare against the Cossacks in the district. His forces increased and early in 1918 he joined the Red army. With the nucleus of his own men he organized the Red cavalry, and after a rapid series of promotions became commander of the first cavalry army. In this capacity he took an active part in the operations against Wrangel and in the Polish War (1920). He became eventually chief of the Red cavalry and was a member of the military revolutionary council of the Soviet Union.

**BUDGE, SIR ERNEST ALFRED WALLIS** (1857– ), English archaeologist, was born in Cornwall on July 27, 1857 and educated at Christ's college, Cambridge, where he became Assyrian scholar and Tyrwhitt Hebrew scholar. In 1885 he became keeper of the Egyptian and Assyrian antiquities in the British Museum, and he conducted excavations at Assuan, at Gebel Barkal on the island of Meroe (the site of the capital of ancient Ethiopia), at Nineveh and Der in Mesopotamia (1888–89), and in the Sudan, when the ancient monuments on the banks of the Nile were threatened with inundation by the raising of the Assuan dam. His long list of publications includes *The Gods of Egypt* (1903); *The Egyptian Sudan* (1907); *The Nile* (1910; 12th ed. 1912); *Literature of the Ancient Egyptians* (1914); *By Nile and Tigris* (1920). He was knighted in 1920.

**BUDGELL, EUSTACE** (1686–1737), English man of letters, the son of Dr. Gilbert Budgell, was born on Aug. 19 1686 at St. Thomas, near Exeter. He matriculated in 1705 at Trinity college, Oxford, and afterwards joined the Inner Temple, London. Addison, who was first cousin to his mother, befriended him, and, on being appointed secretary to Lord Wharton, lord-lieutenant of Ireland, in 1710, took Budgell with him as one of the clerks of his office. Budgell took part with Steele and Addison in writing the *Tatler*. He was also a contributor to the *Spectator* and the *Guardian*—his papers being marked with an "X" in the *Spectator* and with an asterisk in the *Guardian*. He was subsequently made under-secretary to Addison, chief secretary to the lords justices of Ireland, and deputy-clerk of the council, and became a member of the Irish parliament. In 1717 he became accountant and controller-general of the revenue in Ireland, but was removed from his post of accountant-general on account of a libellous pamphlet. In the year 1720 he lost £20,000 by the South Sea scheme, and afterwards spent £5,000 more in unsuccessful attempts to get into parliament. He began to write pamphlets against the ministry, and published many papers in the *Craftsman*. In 1733 he started a weekly periodical called the *Bee*, which he continued for more than 100 numbers. By the will of Matthew Tindal, the deist, who died in 1733, a legacy of 2,000 guineas was left to Budgell; but the bequest (which had, it was alleged, been inserted

in the will by Budgell himself) was successfully disputed by Tindal's nephew and nearest heir, Nicholas Tindal. Hence Pope's lines in the *Epistle to Dr. Arbuthnot*:

Let Budgell charge low Grub Street on his quill,  
And write whate'er he pleased—except his will.

The scandal ruined him. On May 4 1737, after filling his pockets with stones, he took a boat at Somerset-stairs, and while the boat was passing under the bridge threw himself into the river.

On his desk was found a slip of paper with the words: "What Cato did, and Addison approved, cannot be wrong." Besides the works mentioned above, he wrote a translation (1714) of the *Characters of Theophrastus*. He never married, but left a natural daughter, Anne Eustace, who became an actress at Drury Lane. See *Gibber's Lives of the Poets*, vol. v.

**BUDGERIGAR**, a small Australian parrot. (See LOVE-BIRD.)

**BUDGET.** A budget is a balance-sheet of estimated revenue and expenditure designed for financing the business of a future period. In national finance the period is usually a year, called a financial year. A shorter period would not include a full round of seasons and harvests and would be unsuitable for purposes of comparison. A longer period would not only increase the difficulty of forecasting, but would lessen the financial control of a representative assembly. For this reason, when Bismarck submitted a two years' budget for 1883 and 1884 to the German Reichstag on the plea of saving time and trouble, the budget for 1884 was ignored by the Reichstag, which passed merely the 1883 budget. Bismarck immediately presented the 1884 budget afresh, and the Reichstag solemnly threw it out vote by vote.

It will be seen that it is not sufficient to define a budget as an account, with Lord Buxton (*Dictionary of Political Economy* s. v. *Budget*) since accounts rest upon the basis of established fact, while a budget looks to the future; nor as "a plan for raising revenue," with Sir Hilton Young (*The System of National Finance*), since revenue is only one side of a balance-sheet. The word is derived from the O.Fr. *bougette*, a little bag. The British chancellor of the exchequer is still said to "open" his budget, or receptacle of documents and accounts, when he makes his annual financial statement.

The commencement of the financial year is determined mainly by parliamentary convenience. In England the date was at first Michaelmas day. Jan 5. (old Christmas day) was adopted as the end of the financial year 1799–1800. In 1854, April 1 was made the beginning of the financial year by an act still in force. Since delay and uncertainty are prejudicial to business, the British chancellor of the exchequer lays before the House of Commons as soon as may be after April 1 a statement giving the out-turn of the previous financial year, as shown by the Exchequer (*q.v.*) account at the Bank of England, the estimated expenditure for the new year, the estimated revenue on the basis of existing taxation, and the changes, if any, which he proposes in order to balance the budget by reduction or increase of taxation. The budget speech is anxiously awaited by the taxpayer and is one of the most interesting events of the parliamentary session. Not only do budget changes affect the pocket of the taxpayer, but the speech is often the occasion for announcing some new policy involving (as new policies are prone to do) additional expenditures for which provision must be made.

The budget system was first established in England, and has been followed with more or less variation in other countries.

It is desirable that the unity of the budget should be preserved by presenting the full estimates of revenue and expenditure in one mass and in one account. Some countries offend against this principle by dividing the budget into two parts—ordinary and extraordinary—and relegating to the latter exceptional or non-recurrent revenue and expenditure. This tends to laxity and the manipulation of the ordinary budget by the transfer of doubtful items to the extraordinary side, and weakens the incentive to deal at once with emergency expense. Sometimes additional budgets are annexed to the main budget, providing apart for special services like posts, telegraphs, telephones, railways, etc. When such additions infringe the unity of the budget they are to be deprecated. No objection can be taken to them if they are merely appended

for further information, the gross figures appearing in the general budget.

A trading company, desirous of concealing from its competitors its rate of profit, will not disclose its gross trading profit in its balance-sheet, but only the net profit after deduction of expenses. There is no such excuse for net budgets. The taxpayer is entitled to a full and frank disclosure of the purpose and amounts of public expenditure and of all sources and amounts of receipts. His constitutional right is to accept or reject taxation.

It is sometimes asserted that the British budget fails to show the full amount of national receipts and expenses owing to the device of appropriations in aid. Sums received by certain departments as fees, proceeds of sales of old stores, etc., are allowed to be used by the departments in reduction of the amounts which would otherwise require to be granted by parliament. They may thus appreciably reduce the grants and the apparent total expenditure. As, however, both gross and net totals are printed in the estimates, the full information is available to the student of finance. If it should happen that the estimated receipts exceed the estimated expenditure, as in the case of the bankruptcy court, the mint, etc. the House of Commons requires a token or nominal vote to be presented for £10 or some other small amount, which brings the whole operations of the department within the scrutiny of the House. With this exception the British budget is a gross and not a net budget.

### THE BRITISH BUDGET

**Preparation.**—It is a peculiar feature of British finance that no proposal which involves expenditure can be carried out without the approval of the Treasury. During the financial year departments approach the Treasury with requests to sanction additional expenditure, either forthwith or from some future date. The Treasury requires a reasoned statement to justify the proposals, and if it is not at first satisfied calls for further explanations. When doubtful points have been cleared up, the Treasury authorizes or refuses to accept the proposals in whole or in part. If additional expenditure is agreed upon the decision is referred to the estimate clerk to note. On Oct. 1, the Treasury sends a circular to the civil service and revenue departments requesting them to prepare and forward their estimates of expenditure for the next financial year. These estimates are checked by the estimate clerk against his record of the accumulated authorizations and he calls attention to any changes for which no Treasury authority has been given or points out that some necessary provision has been omitted. He compares the estimates, item by item, with those of previous years. An item may have been increased by some temporary emergency in the past and watchfulness is required to see that it is not continued on the same basis when the emergency is over. When for some time the actual expenditure has fallen considerably below the provision for specific items, pressure is applied for closer estimating. A rise in the purchasing power of money will justify the estimate clerk in looking for lower estimates for stores and materials. Intelligent scrutiny of this kind has often proved extremely effective. But while economy must be considered, sufficiency must also be borne in mind. To frame unduly high estimates would weaken parliamentary control, add to the difficulties of the chancellor of the exchequer, and result in an unnecessarily burdensome scheme of finance. On the other hand inadequate provision necessitates a further application to parliament and disturbs the settlement made by the year's budget. The estimates, approved by the Treasury with or without modification, are presented in detail to parliament.

The fighting services (the Army, Navy and Air Force) are no exceptions to the general rule that all expenditure must be approved by the Treasury, and the usual checks are applied throughout the year to such matters as pay and numbers of their civilian staff, etc. But the size of the forces, which governs the need for stores, uniforms, pay, rations, munitions and other chief heads of expense, is a matter of high policy settled in consultation with the chancellor and the cabinet. Technical requirements of the forces are obviously not susceptible to minute Treasury criticism. The estimate clerk's supervision is, in their case, little more than for-

mal. Each of the fighting arms is provided with a high financial officer whose duty it is to watch over financial interests within his department.

When all the estimates are sanctioned, a summary of these supply charges, as they are called, is laid before the financial secretary and the chancellor of the exchequer. An estimate is next made of the consolidated fund charges, which are not voted annually by the House of Commons, but rest upon statutory foundations, until parliament shall otherwise determine. Such charges are the interest and management of the national debt, payments to the road fund and to local authorities, the civil list (a life-annuity settled by parliament upon the sovereign at his succession in return for his surrender of the more valuable income from Crown lands), salaries and pensions of the speaker of the House of Commons, the judges, the comptroller and auditor-general, and others whose independence is shielded by depriving the House of an opportunity for criticism of their actions which would be given if their salaries were voted annually. Adding together the estimated supply charges and consolidated fund charges we have the total expenditure for which provision must be made.

It is now necessary to turn to the revenue side of the balance-sheet. The revenue departments—the customs and excise, the inland revenue and the post office—furnish to the chancellor their estimates of receipts on the existing basis and on the basis of any changes which are proposed. In framing these estimates they take account of the state of trade, the growth of population, and other disturbing factors. After allowing for capital transactions such as interest or principal receipts from loans, and miscellaneous revenue, the chancellor is able to strike a balance of estimated surplus or deficit. This will be modified by any changes approved by the cabinet in respect of policy, and a fresh balance-sheet is thus reached which may be adjusted on the revenue side by new taxes, increased rates of old taxes, repeal or reduction of existing taxes. The final result should show a balance on the right side, with due regard to contingencies not easily foreseen. The chancellor is now in a position to lay his draft budget before the cabinet and with their approval to unfold to the House of Commons the measures which are proposed to meet the financial needs of the nation in the course of the year. In times of peace he should pay his way and leave a small margin on the right side, but not too large a margin, or he will be pressed to reduce the burden of taxation forthwith. Lord Goschen's budgets were attacked by Lord Farrer on the ground that surpluses were "manufactured" by deliberate under-estimate of revenue and over-estimate of expenditure. Such a charge is more easily made than proved. If it were established it would show that the chancellor was unusually courageous, confident of continuance in office, and ready to sacrifice immediate popularity to an uncertain future.

**Parliament and the Budget.**—As the control of the British Treasury over the preparation of the estimates is peculiar to Great Britain, so is the presentation of the budget to the legislature. Instead of being embodied formally in a budget bill, as is the case in most countries of Europe, where the whole scheme of revenue and expenditure for the year is submitted for the sanction of parliament, the British budget is merely explained to the House of Commons by the budget speech. The House is called upon to authorize part of the estimated expenditure—the supply charges—and to assent to such changes in the law as may be needed to give effect to the revenue proposals of the budget.

At the beginning of each session the House sets up two great financial committees—the committee of supply and the committee of ways and means. Each is a committee of the whole House, sitting under a chairman instead of the Speaker. A former clerk of the House, Sir Reginald Palgrave, says "the exclusion of the King's emissary and spy—their speaker—was the sole motive why the Commons elected to convert themselves into a conclave called a committee, that they might meet together as usual, but without his presence." The speaker is no longer, if he ever was, an emissary and spy of the sovereign, but the practice continues. It has the advantage that in committee discussion is more informal and conversational, since a member may speak more than once. Broadly speaking, the business of the committee of supply is to

agree to the votes required, as shown in the estimates, for the service of each department. The committee of ways and means approves the issue from the exchequer of the money which is needed to make supply effective.

**The British "Budget Day."**—As soon as the committee of supply has voted a grant for the ensuing year, the committee of ways and means (*i.e.*, the whole House) meets and the chancellor lays before it his budget proposals on what is called the "Budget Day." He takes the opportunity to examine the financial situation of the country as disclosed by the exchequer receipts and payments of the previous year, gives the reasons for any appreciable variation between estimates and results for that year, expounds the changes in the national debt, states the forecast for the current year, and discloses his plans for balancing the account. A white paper distributed just before his speech now enables him to abridge the statistical part of his exposition. The final balance-sheet, after alterations proposed by the chancellor of the exchequer, in 1927–28, was as follows:

| ESTIMATED REVENUE, 1927–28                             |         | ESTIMATED EXPENDITURE, 1927–28                             |         |
|--|---------|--|---------|
| (In thousands of £.)                                   |         | (In thousands of £.)                                       |         |
|  | £       |  | £       |
| Customs . . . . .                                      | 112,120 | I. Consolidated fund services                              |         |
| Excise . . . . .                                       | 145,760 | National debt services:                                    |         |
|  |         | Interest, etc. . . . .                                     | 305,000 |
| Total customs and excise                               | 257,880 | Sinking funds. . . . .                                     | 65,000  |
|  |         |  | 370,000 |
| Motor vehicle duties . . . . .                         | 24,100  | Road fund . . . . .  | 19,500  |
| Estate, etc., duties . . . . .                         | 67,800  | Payments to local taxation accounts, etc. . . . .          | 14,300  |
| Stamps . . . . .                                       | 25,500  | Payments for Northern Ireland residuary share etc. . . . . | 5,400   |
| Land tax, house duty and mineral rights duty . . . . . | 800     |  |         |
| Income tax . . . . .                                   | 247,000 | Other consolidated fund services . . . . .                 | 3,700   |
| Super tax . . . . .                                    | 62,000  |  |         |
| Excess profits duty . . . . .                          | 3,000   | Total consolidated fund services . . . . .                 | 412,900 |
| Corporation profits tax . . . . .                      | 2,700   |  |         |
| Total inland revenue . . . . .                         | 408,800 | II. Supply services  |         |
| Total receipts from taxes . . . . .                    | 690,780 | Army votes . . . . .                                       | 41,565  |
| Postal service . . . . .                               | 37,300  | Navy votes . . . . .                                       | 58,000  |
| Telegraph service . . . . .                            | 5,700   | Air votes . . . . .  | 15,550  |
| Telephone service . . . . .                            | 19,000  | Civil votes . . . . .                                      | 235,725 |
| Total post office . . . . .                            | 62,000  | Customs and excise and inland revenue votes . . . . .      | 12,007  |
| Crown lands . . . . .                                  | 1,050   | Post office vote . . . . .                                 | 57,643  |
| Receipts from sundry loans, etc. . . . .               | 23,500  | Total supply services . . . . .                            | 420,490 |
| Miscellaneous:   |         | Total expenditure . . . . .                                | 833,390 |
| Ordinary receipts . . . . .                            | 30,500  |  |         |
| Special receipts . . . . .                             | 27,000  | Surplus . . . . .  | 1,440   |
| Total non-tax revenue . . . . .                        | 144,050 | Total . . . . .  | 834,830 |
| Total revenue . . . . .                                | 834,830 |  |         |

Immediately after the budget speech the budget resolutions are moved to give effect to the scheme of revenue proposed. For the most part taxes rest upon continuing statutes, but one direct tax (the income tax with its surtax) and one indirect tax (the tea duty) are voted for one year only in order to ensure that direct and indirect taxation are brought within the purview of the House every year even though there be no budget changes in respect of them.

The committee of supply, to which the estimates of expenditure are referred, can vote the grant proposed to it, or reduce it, or reject it, but may neither increase it nor annex a condition to it nor alter its destination. The House will only vote money on a recommendation from the Crown, signified through a minister. If it desires to increase a vote this can only be done by a supplementary estimate, or by the withdrawal of the original estimate and its replacement by a new one. As rejection or even reduction of a vote would be a rebuff to the ministry and suggest want of confidence in the government, it would possibly lead to a general election. It is therefore very exceptional for discussions in supply to result in any change in the original estimates. When the committee has approved a grant, it reports its resolution to the House

where the matter may be debated again with the speaker in the chair. If the House agrees with the committee's resolution the estimate goes to the committee of ways and means whose task it is to approve the provision of the necessary funds.

**How the British Budget Becomes Law.**—Upon the resolution of the ways and means committee is based a consolidated fund bill to authorize the issue out of the consolidated fund of sums to meet the grants in supply. The lump sums so authorized may not exceed the total of the grants previously voted in supply, and more than one consolidated fund Act is passed in each session. At the end of the session the final Consolidated Fund (Appropriation) Act completes the grants required, and earmarks or appropriates to each service the money assigned to it in supply.

From the committee of ways and means also springs the Finance Act which reimposes the annual taxes and makes any necessary changes in them or in taxation generally. After the passing of these two measures the budget is not only a plan but a legalized plan.

Twenty days before Aug. 5 are allotted to the committee of supply for the consideration of the estimates, including days spent on the vote on account and procedure in ways and means, but the government may allow three extra days if it thinks fit. At the end of the allotted days all outstanding votes are "guillotined" or put to the vote without discussion. Votes on account are in the nature of advances made to departments by special grant before there has been time to examine the estimates in detail in supply. As it is impossible for the committee of supply to consider all the estimates in the allotted time it is usual to allow the opposition to choose the order in which the votes shall be set down for discussion.

The estimates committee, consisting of 15 members drawn from all parts of the House, was first appointed in 1918. It may examine any estimate it chooses and send for persons, papers and records, but may not question the policy implied in the estimates. As policy to a large extent governs expenditure, and as the examination comes after the estimate has been presented, the discussions of this committee, like those in supply, and for the same reasons, have little effect upon the financial proposals of the year. The committee is purely advisory and the limitations under which it works deprive it of much practical influence.

When departments find their grants insufficient they put forward supplementary estimates for further grants. Such estimates should always be jealously scrutinized, and enquiry should be pressed why the contingencies were not foreseen and whether expenditure is so urgent that it cannot be postponed till the next budget. The estimates, if justified, must be passed through all their stages in time for the appropriation bill in order to avoid an excess of expenditure over the grant—a financial offence of the first magnitude. In cases where an excess has been incurred it is referred to a committee at the beginning of the next session in order that it may be fully justified and an excess vote passed to regularise the proceeding.

The finance bill and the consolidated fund bills are sent up to the House of Lords with a certificate by the speaker that they are money bills. By the Parliament Act, 1911, if a money bill, as defined in that act, be sent to the Lords at least one month before the end of the session, and is not passed by the House of Lords without amendment within one month, the bill shall, unless the House of Commons direct to the contrary, be presented to His Majesty and become an Act of Parliament on the royal assent being signified, notwithstanding that the House of Lords have not consented to the bill. The speaker consults two senior members of the House of Commons before giving his certificate, though the act makes his opinion sufficient. Complaint has been made that, as no one is infallible, the safeguard is not adequate, that a member of the House of Lords should be included in the panel, and that the statutory definition of a money bill needs amendment to ensure that far-reaching changes are not improperly withdrawn from the consideration of the Lords merely because they are inextricably interwoven with financial proposals and not easy to distinguish.

It will be seen that the budget, though theoretically the work

of parliament, is dominated from start to finish by the executive government. The House of Commons accepts the estimates of expenditure as presented. It discusses the finance bill, and may succeed in making amendments designed to remove doubts or obviate hard cases. But the chancellor of the exchequer, though willing to smooth the passage of the measure by accepting small changes, will use his majority if there is any serious menace to the revenue which he requires. The dissent of the Lords is, like the veto of the Crown, no longer operative as a check upon the settlement of the budget.

**Execution of the Budget.**—A programme is one thing, its execution another. The House of Commons does not cease to concern itself with the budget proposals when they have received its assent, but is interested to see whether they work out according to plan, and if not, why not. The collection of revenue and the expenditure on public services are in the hands of officials whose operations are subject to control and audit on behalf of the House. The comptroller and auditor general, a high officer of parliament, appointed by the Crown and independent of any department, is required to make a test audit of the revenue receipts, to audit the accounts of expenditure of each department, and to report to parliament any irregularities or other matters of interest arising out of the accounts. He must see that any surplus of grant over expenditure is surrendered to the national debt commissioners for the old sinking fund. It is also his duty to authorize all issues of moneys out of the exchequer and to take care that no such issues are made without parliamentary authority. His annual report is laid before the House and referred to the public accounts committee, which summons before it the accounting officers and officials of the Treasury and other departments for such explanations as it may desire, and reports its proceedings to the House. Any recommendations made by the public accounts committee are communicated to the Treasury for consideration.

The public accounts committee, like the estimates committee, is precluded from entering upon questions of policy, and it has often been urged that its control would be more effective in the interests of economy if it were aided by an inspector-general, whose function it would be to investigate wasteful expenditure wherever it can be found. The estimates are framed upon a non-functional basis, under such headings as salaries, travelling expenses, stores, etc. If they were set out on a cost-accounting basis, comparison would be more revealing of lack of economy. An experiment was made in this direction with the army estimates, but was abandoned after a short trial for reasons which, so far as they have been made public, are far from convincing.

There is in England no formal act of parliament to close the accounts of the year. The exchequer account, being merely a cash or pass-book account, is made up when the Bank of England closes at 4 P.M. on March 31. The account audited by the comptroller and auditor general is the appropriation account. It includes all orders for payment drawn on or before March 31 whether or not they were cashed before April 1. Three months in the case of civil departments and six months in the case of the fighting services are allowed for the purpose of including all such transactions. The totals of the appropriation account therefore differ slightly from those of the exchequer account. It is the appropriation account which is dealt with by the public accounts committee, and when this account is closed any further receipts or payments, whether proper to the past or present year, are included in the accounts of the year in which they are encashed.

In some countries the accounts are kept open until all the receipts and payments proper to the year can be included. This sometimes requires the accounts to be kept open for several years. The British system has the advantage of closing the accounts promptly, and with approximately close results, outweighing the advantages of the theoretically more exact method.

The serious political, constitutional and financial changes brought about by the World War severely jolted the framework of the budgets of governments all the world over. But it must be emphasized that the essentials of a budget are few in number—(i.) an estimate of the expenditure required for discharging the

functions of the authority concerned, brought into relation with (ii.) an estimate of the revenues out of which the expenditure is to be defrayed during the budgetary period. It follows that assets and liabilities find no place in the budget except in so far as they involve receipts and payments within that period. A budget does not afford a picture of the financial condition of a government. It does not show the total cost of governing a country, since there may be subordinate local governments, or a superior federal government as in Germany, the United States, Australia, Canada, India, South Africa, etc. The demarcation between such varied authorities is determined by the law and custom of the constitution or by historical circumstances.

The most fertile source of fallacies in statistics is the comparison of dissimilar things as if they were alike. It would for example be grossly misleading to compare the cost of government in a highly centralized kingdom, like Italy (where under the Fascist regime only sanitary and social services are left to local government), with the federal budget of the United States, where 48 states, largely autonomous, with their own tax laws, include large cities, boroughs, urban and rural districts each with its own budget and financial system. Payments between these authorities are inextricably interwoven, and an addition of all their expenditures would include several items two or three times over. A budget may be accompanied by a mass of documents, accounts, financial memoranda and explanations designed to show the financial situation in its entirety. From the budget itself no more can be extracted than the limited information which it contains for its limited purpose.

#### BUDGETS OF OTHER COUNTRIES

**France.**—The financial year begins on Jan. 1. The budget consists of several documents:

(i.) The general budget. To this are appended "annexed" budgets for the national printing office, the gunpowder service, the posts, telegraphs and telephones, the mint, the railways and state factories in Alsace-Lorraine, the state railways, the national savings banks, the naval invalidity fund and other special establishments.

The general budget is, in principle, a gross budget. But only the net surplus or net deficit is carried to the general budget in the case of the printing office, the gunpowder service, the posts, telegraphs and telephones, the mint and the railways and state factories in Alsace-Lorraine. Any surplus or deficit of the national savings banks account is carried to its own reserve fund account.

(ii.) Cost of armies of occupation (expenses recoverable).

(iii.) Debt redemption fund.

(iv.) Accounts of autonomous offices attached to various departments.

(v.) Special Treasury accounts, of which the chief are expenditure on state railways, interest on advances by the Bank of France, reduction of amounts advanced by the Bank of France, payment of debt service to Great Britain and the United States, and advances to foreign governments.

Besides all these there is a special Treasury account of payments by various powers in execution of the Peace treaties, to which all reparation recoveries are credited. The receipts are destined to cover the cost of armies of occupation, sums due to war victims, service of the inter-Allied debt, and redemption of internal debt.

Each department is responsible for the preparation of its own estimates, which are centralized (but not controlled) by the ministry of finance. All revenue and all expenditure is voted for one year only. No taxes are permanent. No charges are laid upon a consolidated fund. Ministers are forbidden to incur liabilities or make payments for purposes not specified in the budget, to overspend the credits granted to them, or to enter into commitments extending beyond the financial year. The hands of the chamber are thus entirely free every year. Each minister is personally and pecuniarily responsible for any breach of financial regularity in these respects.

The budget bill is presented to the Chamber of Deputies without a speech, and is referred to the finance committee of about 40

members, which is a microcosm of the chamber, based on proportional representation of the party groups. This committee overhauls both sides of the budget, sends for persons and papers, and reports to the full chamber a budget which often differs considerably from the original. It follows that the chamber discusses, in practice, not the government proposals but the proposals of the finance committee. Such discussions may result in further changes. But no additions may be made to the estimates of expenditure unless they are simultaneously coupled with proposals for raising an equivalent amount of additional revenue. No limit is imposed upon the number of sittings or upon the speeches.

The budget settled by the chamber is sent to the Senate, which claims equal powers of revision, sets up its finance committee and follows the same procedure as the chamber. Amendments made in the Senate, either by way of increase or reduction, are sent down to the chamber, which may accept, modify or reject them. The budget is then returned to the Senate, and in the last resort differences are settled by conference or compromise, or submission on one part or the other.

The minister of finance is charged with the duty of keeping the departments in funds, within the limits of the credits granted to each of them, but he is not concerned with their use of such funds. The accounts of each department are, at the end of the year, rendered to the ministry of finance, which adds its own account and the accounts of receipts, and prepares a general account which is sent to the *cour des comptes*—a quasi-judicial and extra-parliamentary tribunal. This court examines all the documents embraced by the accounts, but does not examine the accountants or officials concerned in administration. It draws up an annual report to the president of the Republic, enumerating the principal irregularities it has found, and stating the accounting reforms it thinks desirable. Ministers are required to reply to the criticisms of the court, whose observations and the replies are printed and the whole is then presented to parliament.

In each chamber an accounts committee is set up to examine the audited accounts. When the bill based upon their reports (*loi de règlement*) is passed the accounts are closed. No closed account has been published for any year later than 1916.

The year 1926 is the first year since the World War in which the closed account shows a balance of surplus on the general budget.

**Germany.**—The financial year begins on April 1.

The general budget is in principle a gross budget, including all receipts except those of certain public undertakings, the posts, telegraphs and telephones, the railways, printing office, etc., and such items as cost of sales by auction, surveys and agency fees. It is divided into two parts, general administration and war charges. These are again subdivided as follows:—

General administration—(i.) ordinary revenue; (ii.) ordinary expenditure (a) recurrent, (b) non-recurrent; (iii.) extraordinary revenue and expenditure.

War charges—(i.) ordinary revenue; (ii.) ordinary expenditure (a) recurrent, (b) non-recurrent; (iii.) extraordinary revenue and expenditure.

Extraordinary expenses in the first part include investments and are so widely construed as to include the cost of building cruisers, while the extraordinary revenue comprises loans and receipts from capital sources, etc. The reparations payments (in fulfilment of the Dawes plan) are regarded as extraordinary expenses in the budget of war charges. The corresponding revenue is derived by transfers from ordinary revenue.

Only net figures are shown in the general budget as regards public undertakings mentioned above. Transfers are made from one budget to another and from one vote to another if the votes are independent. In certain special cases unspent credits for non-recurrent and extraordinary expenditure may be carried over to another year.

After the revolution of 1918 a new law of the constitution was enacted on Aug. 11, 1919. This law is incomplete so far as budgetary procedure is concerned. To some extent former practice is still in use, and new standing orders have made some modification, but custom has not yet crystallized into a final shape.

The budget takes the form of a law, which, like all other laws, is voted by the Reichstag alone. The budget must be signed and published by the president of the Reich. It is prepared by the government, and after approval by the cabinet is presented by the minister of finance to the Reichsrat, in which the governments of the states are represented. The Reichsrat may adopt or amend the budget proposals, which are then communicated to the Reichstag with the comments of the cabinet. The Reichstag decides by a majority upon any difference between the cabinet and the Reichsrat.

The Reichstag refers the budget to a standing budget committee and may reduce the estimates of expenditure or increase them. But over any increase not proposed by the government the Reichsrat has a veto. Failing agreement the president of the Reich may order a referendum.

So far as revenue is concerned further precautions against hasty legislation are taken. All laws proposed must first be presented to the vote of the Reichsrat, but before new taxes are proposed to the Reichstag the Reichswirtschaftsrat or imperial economic council must also be consulted in advance. This advisory body of experts is non-political. Its duty is to sound a note of warning if financial proposals threaten to react unfavourably upon the economic life of the nation. The Reichsrat has a suspensive veto on new taxes proposed by the Reichstag. If it ultimately rejects such proposals, and if the president does not order a referendum the Reichstag may carry the law by a two-thirds majority over the head of the Reichsrat. No government may remain in office if it has lost the confidence of the Reichstag.

The accounts are kept open till May 10, and are then closed upon a cash basis of receipts and expenditure for the financial year. The audit court exercises its control after expenditure has taken place and reports to the minister of finance, who lays the reports and closed accounts before the legislature. The closed accounts for 1925-26 were published on Feb. 3, 1927.

The reparation payments under the Dawes plan (London Agreement of Aug. 1924) amount to 1,750 million gold marks in 1927-28, and thenceforward 2,500 million yearly, subject to increase on a "prosperity index" based on various factors of national capacity to pay.

**Italy.**—The financial year begins on July 1. Before the end of January, the minister presents to the chamber the estimates prepared by the various ministers embodied in a budget bill for the ensuing year and providing for any modifications, such as supplementary credits, proposed for the current financial year. The principles of the unity of the budget and of gross budgeting are observed, with the exception of an autonomous amortization fund which has been created for the reduction of the war debts to Great Britain and the United States. This fund is credited with the whole of the Italian share of reparation payments. Certain special funds and autonomous undertakings including railways are the subject of separate accounts, appended for information, the gross figures being included in the general budget. A certain elasticity is allowed for excess of expenditure over the authorized grants in specified cases.

There are two categories of budget accounts (*a*) the authoritative account, including all the revenue and expenditure legally due in the year, whether or not received within the year; (*b*) the arrears account, comprising all outstanding claims and liabilities. A patrimonial account is also submitted, showing assets and liabilities of the State. Any surplus on the budget accrues to the Treasury and is not carried forward to the next budget.

A *giro* account, published for information, is designed to disclose "veiled" charges upon the public which would not otherwise be disclosed in the accounts. Examples are the rent of State buildings occupied by the State for official purposes, interest on State securities held by the State, taxes due on State property. In all these cases the State is both debtor and creditor for equal amounts and no cash passes.

The budget bill is laid before the Chamber of Deputies, which elects a budget committee of 36 members. Every deputy may nominate 27 members. Those who receive less than one-eighth of the votes are struck out of the list. The committee usually consists of ex-ministers or other prominent deputies. It appoints sub-

committees and reports in writing to the chamber. The result, as in France, is to recast the budget. The powers of the Senate are so restricted that it is claimed that the Senate may only correct material errors due to some oversight in the chamber.

The audit court is peculiar to Italy in so far as it exercises anterior or preventive control, over (*i.*) acts and decrees entailing expenditure. All these must be registered by the court, which has the right to refuse registration if they are judged to be contrary to law, or, if not, to refer to parliament the question of maintaining them; (*ii.*) pay vouchers, which must be not only registered but also endorsed by the court; and (*iii.*) the issue of Treasury bills. The audit court also exercises posterior control over (*i.*) receipts, (*ii.*) cash transactions and (*iii.*) the closed accounts.

**Australia.**—The financial year begins on July 1. The budget estimates are presented to the House of Representatives by a speech of the treasurer, and to the Senate on the same day by a speech of another minister; the procedure throughout, as in most of the self governing parts of the empire, follows very closely that of the British House of Commons.

The government receipts and expenditure are shown in three distinct funds (*a*) consolidated revenue, (*b*) loan, (*c*) trust funds.

The first is credited with all cash receipts of real revenue, but not receipts from loans, and debited with all expenditure to be paid out of such revenue. The loan fund is credited with proceeds of loans and debited with expenditure to be met by loans. All proceeds of the sale of property purchased (or of work produced or paid for) out of the loan fund are credited to that fund. The trust funds are those administered by the State outside the annual budget. Such are the invalid and old age pension fund, the interest (Imperial Government) and war pensions funds. The assets of these trust funds are mainly miscellaneous receipts and budgetary grants.

The accounts of these three divisions of government receipts and expenditure are so closely interwoven that it is hardly possible to obtain a proper conspectus of the finances of the Commonwealth without considering them all. Any surplus or deficit on the accounts is carried forward to the next year.

As a provisional arrangement, subsidies are at present paid by the central government to the states at the rate of 25/- per head per annum.

**India.**—The financial year begins on April 1. As this is before the monsoon falls accurate forecast is made more difficult, and the Chamberlain committee proposed that the date should be altered to Oct. 1. The proposal has not been adopted.

The Government of India Act, 1919, introduced various constitutional changes, one of which makes each provincial government responsible for its own finances. The Indian States are similarly responsible. So far as finance is concerned the Indian budget must be regarded as a federal budget. Section 25 of the Act requires that "the estimated annual expenditure and revenue of the governor general in Council shall be laid in the form of a statement before both chambers of the Indian legislature in each year"; that "no proposal for the appropriation of any revenue or moneys for any purpose shall be made except on the recommendation of the governor general"; and that the Government's proposal for the appropriation of revenue or moneys relating to: (*I.*) interest and sinking fund charges on loans, (*II.*) expenditure of which the amount is prescribed by or under any law, (*III.*) salaries and pensions of persons appointed by or with the approval of His Majesty or by the secretary of state in Council, (*IV.*) salaries of chief commissioners and judicial commissioners, and (*V.*) expenditure classified by the order of the governor general in Council as (*a*) ecclesiastical, (*b*) political, (*c*) defence, shall not be submitted to the vote of the Legislative Assembly unless the governor general otherwise directs. All proposals relating to headings of expenditure not specified above shall be submitted to the vote of the Legislative Assembly in the form of demands for grants. In cases, however, where the assembly refuses or reduces the demands of the Government relative to any matter which the governor general in Council deems essential to the discharge of his responsibilities, it is open to him to override the decision of the assembly and act as if the grant asked for had been assented to.

The general budget is divided into two parts: (a) revenue, and expenditure charged to revenue (mainly representing current revenue and expenditure); (b) "receipts and disbursements" (representing capital transactions). This part of the budget is often called the "Ways and Means Budget."

In addition there is a special railway budget from which the net surplus is transferred to the revenue side of the general budget. Only the net receipts from irrigation works are included. With these exceptions the budget is a gross budget.

The budget is presented to both chambers at the same time—to the Legislative Assembly by the financial member, and to the Council of State by the financial secretary. After an interval of a week for reflection a day or two is allotted for a general discussion in which details are not to be brought forward. Next comes the voting of supplies for which a maximum of 15 days is allowed. The Council of State does not amend the appropriation bill, dealing with grants, but discusses in detail the finance bill, dealing with revenue. About one half of the expenditure is non-votable or permanent. The executive government of India is responsible, not to the central legislative in India but to the British parliament. And finally the Constitution of 1919 is professedly experimental and transitional. For all these reasons the relations of financial authorities are by no means settled, and the governor general has been obliged in recent years to certify the budget or legalize it by an act of authority without the consent of the legislature.

The accounts, kept on a cash basis, are closed on Oct. 10. Any surplus on the revenue account is applied to the reduction of debt unless the Government and the legislature otherwise determine.

**BIBLIOGRAPHY.**—The Memorandum on Public Finance, 1922-26, C.E.I. 34, issued by the League of Nations, Geneva, 1927, describes the budgetary systems of 26 governments. For a general discussion of the subject see R. Stourm, *Le Budget* (American translation, by Plazinski, 1917); "Budget" and "Finance" in Palgrave's *Dictionary of Political Economy*, (1925-26); G. Jéze, *Théorie générale du Budget* (German translation, with additions by F. Neumark, 1927); *The Statesman's Year Book* (annual) gives the latest budget figures for all countries.

**Great Britain.** The detailed figures appear in the annual Finance Accounts. The history of British budgets may be followed in S. Buxton, *Finance and Politics, 1786-1855*; S. Northcote, *Twenty Years of Financial Policy, 1842-1861* (1862); Sir B. Mallet, *British Budgets, 1887-1912* (1913); F. W. Hirst, and J. E. Allen, *British War Budgets (1914-1924)*, (1926). For descriptions of the system see H. Higgs, *The Financial System of the United Kingdom* (1914); Sir H. J. Gibson, *Fifty years of the Exchequer and Audit Departments' Act* (1916); A. J. V. Durell, *Principles and Practice of the System of Control over Parliamentary Grants* (1917); Willoughby and Lindsay, *Financial Administration of the United Kingdom* (1917); H. Higgs, *A Primer of National Finance* (1919); Harvey Fisk, *English Public Finance* (1920); R. G. Hawtrey, *The Exchequer* (1921); Sir Hilton Young, *The System of National Finance* (1924); G. Locker Lampson, *An Outline of the Financial Procedure of the House of Commons* (1924); J. W. Hills, *The Finance of Government* (1925).

#### UNITED STATES OF AMERICA

The financial or fiscal year in the United States begins on July 1. Until 1921, the United States had no centralized budget. Congress was called upon to vote annually the appropriations necessary to cover the estimates of expenditures of the various departments and independent establishments. Several committees in the two houses of Congress framed the bills, without any co-ordination of effort.

**Federal Bureau Established.**—The first bill to establish a bureau of the budget was passed in 1920 and vetoed by President Wilson because of the provision that a certain official would be immune from removal by the president. The bill was re-passed by Congress and signed by President Harding on June 10, 1921. The bureau of the budget is in the Treasury department, but independent of that department, being directly under the president. The head of the bureau is the director, who is appointed by the president. Under rules and regulations prescribed by the president, the bureau prepares for him estimates for an annual budget and also such deficiency estimates as the president may recommend from time to time to Congress. To this end, under the Budget and Accounting act, the bureau has the authority "to assemble, correlate, revise, reduce or increase the estimates of the several departments and establishments" (sec. 207). The head of each department and establishment appoints a budget officer whose duty is to prepare, under his direction, the departmental or establishment estimates of appropriations and such supplemental or deficiency estimates as later may be required (sec. 214). These officials are liaison officers between the department or establishment and the bureau. The bureau deals directly with them in its routine of preparing the budget. The estimates are prepared and submitted to the bureau in prescribed forms (sec. 216). On or before Sept. 15 of each year the head of each department and establishment revises and submits his estimates to the bureau (sec. 215). The bureau also may be directed by the president to make detailed studies of the departments and establishments in order to determine what changes should be made in the interest of economy and efficiency, in "(1) the existing organization of activities, and methods of business of such departments or establishments; (2) the appropriations therefor; (3) the assignment of particular activities to particular services; or (4) the regrouping of services" (sec. 209). Each department and establishment is required, under presidential regulations, to furnish to the bureau such information as it may from time to time require. Officials of the bureau are given the authority to have access, for the purposes of examination, to the books, papers and records of any department or establishment that they wish to inspect (sec. 213).

**Preparation of the Budget.**—The steps taken in the preparation of the budget may be considered as: (1) president's financial policy; (2) preliminary estimates; (3) final estimates; (4) hearings before the board of estimates of the bureau; (5) estimates returned to departments for revisions; and (6) preparation of the budget document. (See Henry P. Seidemann, "The Preparation of the National Budget" in *The Annals*, May, 1924.) The budget, with whatever recommendations the president desires to make is transmitted to Congress at the convening of each regular session on the first Monday in December. Deficiency estimates are submitted from time to time in the same way. The documents which are submitted in this message are: (a) estimates of the expenditures and appropriations he judges necessary for the support of the Government for the ensuing fiscal year; (b) his estimates of the receipts of the Government during the ensuing fiscal year under (1) laws existing at the time the budget is transmitted and (2) the revenue proposals, if any, contained in the budget; (c) the expenditures and receipts of the Government during the last completed fiscal year; (d) estimates of the expenditures and receipts of the Government during the fiscal year in progress; (e) the amount of annual, permanent or other appropriations, including balances of appropriations for prior fiscal years, available for expenditure during the fiscal year in progress, as at November 1 of such year; (f) balanced statements of: (1) the condition of the Treasury at the end of the last completed fiscal year, (2) the estimated condition of the Treasury at the end of the fiscal year in progress and (3) the estimated condition of the Treasury at the end of the ensuing fiscal year, if the financial proposals contained in the budget are adopted; (g) all essential facts regarding the bonded and other indebtedness of the Government; and (h) such other financial statements and data as in his opinion are necessary or desirable in order to make known in all practicable detail the financial standing of the Government.

**Appropriation Bills.**—With the establishment of the bureau of the budget, the House of Representatives centred all of the authority in framing the major appropriation bills in the committee on appropriations. This committee is composed of 35 members. The committee is divided into 13 sub-committees of five members each. Each sub-committee frames one of the major appropriation bills, but each bill must be acted upon by the full committee on appropriations before it is reported to the House. Through practice, all of the major appropriation bills originate in the House. The committee on appropriations has a rule that no appropriation may be considered by it which has not been recommended by the bureau of the budget, and, if considered, may not be increased. Further no official is allowed to oppose a reduction of his estimate before the committee. Hearings are held by the sub-committees and sometimes by the full committee, at which the director of the budget and other witnesses, with documents and explanations, may be required to assist the committee. The annual appropriation bills which are framed as the result of the division of the budget into 13 items are for: (1) the agricultural department; (2) labour department; (3) District of Columbia; (4) executive office and independent offices, commissions, etc.; (5) interior department; (6) legislative branch; (7) navy department; (8) post office department; (9) state department; (10) treasury department; (11) war department; (12) commerce department and (13) justice department. Deficiency appropriation bills may cover one or more of these divisions.

When the bill has been reported to the House amendments may be made. Upon passage by the House it goes to the Senate, where it is referred to the committee on appropriations and in turn to a sub-committee of that body. Two members of the committee of the Senate having particular interest in the department or establishment included in the appropriation sought may sit with the committee in considering the bill there. Any differences between the two houses of Congress are settled by one or the other accepting the bill as passed by the other body, or through conference committees of both houses by which compromises are effected. The appropriation bills generally are larger after passage by the Senate.

**Accounting of Funds.**—Receipts and expenditures are accounted for in: (1) a general fund; (2) a loan fund; (3) special accounts, as the post office account; and (4) revolving funds. The general fund embraces all ordinary receipts, including, e.g., proceeds of Government sales and loans (repayment of interest or principal by foreign Governments), and all ordinary expenditures, including capital expenditures, interest on the debt, redemption of the debt, etc. It is in principle a gross budget and a unified budget. The loan fund accounts for credit operations in connection with the principal of the public debt. Revolving funds are allotted to some departments as working capital. In these cases net expenditure is shown in the budget. At the end of the fiscal year, cash receipts and expenses of the general fund and the loan fund are published, as also accounts of warrants issued but not cashed. If there is a deficit in the receipts, the president is obliged to recommend to Congress new taxation, new loans, etc. A surplus or deficit balance is not carried from one budget to another, but is accounted for in the Treasury cash statement.

**State Budgets.**—All of the States have made provisions for a budget. In six, California, Louisiana, Maryland, Massachusetts, Nebraska and West Virginia, the procedure is provided for in the State constitution. In Maryland, the plan directs the governor to require estimates from the different divisions of the government and he may revise the same, except those relating to the legislature, judiciary and school system. He submits his estimates in the form of two budgets and two accompanying bills for one year each, for the use of the legislature at its biennial session. The legislature may not increase those relating to the branches of government other than the legislature and judiciary, but may reduce the others with the exception of certain constitutional limitations as to the public school system and also salaries for officers for the terms for which appointed. The Massachusetts budget plan is similar except that the legislature may make

increases, subject to the authority of the governor to veto individual items in appropriation bills. The Nebraska budget is also similar, except that by a three-fifths vote of both houses the legislature may, without subjecting the item to veto, increase particular provisions. In Louisiana the tax commission is the budget-making authority. The legislature there may not pass an appropriation bill within five days of the end of the session. The governor in California is required to submit a budget plan with a bill. Before the budget bill is enacted, no appropriation bill, unless for legislative expenses, may be passed without the approval of the governor. The governor may reduce or eliminate items, but the legislature by a two-thirds vote may override his action.

Under legislative enactment, a department of finance has been created in Illinois, whose head is appointed by the governor. The legislature may increase the appropriations over his recommendations, but under the centralized control which the governor exerts over the non-constitutional officers, a partial executive budget is in effect. Utah has a legislative act similar to the Maryland plan, whereby the legislature will not make increases over the gubernatorial recommendations and will not consider any appropriations not so recommended to it. A similar plan in effect in New Mexico also permits the governor and executive and administrative heads to appear and be heard by the legislature. The secretary of State, appointed by the governor, is the budget officer in Pennsylvania. The legislature is not limited in its action on the budget but the governor may veto particular items of appropriation bills. The governors of Vermont and Tennessee also submit budgets to the legislatures. In Wisconsin a board of affairs controls the budget-making. It is composed of the governor as chairman, three of his appointees, the secretary of State, the president pro tempore of the senate, the speaker of the house and the chairmen of the two legislative finance committees. In the remaining States, such budgets as exist are largely the result of legislative rather than executive supervision. They comprise hearings by legislative committees on appropriations desired by State departments, agencies and institutions and submitted by them in individual estimates. New York State also has a budget plan.

**Municipal Budgets.**—Budget plans also have been adopted by many cities. In New York the responsible municipal heads submit estimates to the board of aldermen. This is followed by the adoption by the board of estimate and apportionment, composed of the mayor, controller, president of the board of aldermen and the presidents of the five boroughs, of a tentative and then a proposed budget for submission to the board of aldermen, after hearings have been held. The aldermen may not increase items but may reduce them, subject to the veto of the mayor, which veto may be overridden only by a three-fourths vote. In Detroit and Philadelphia the head of each department is given a specified sum to spend, along with a uniform classification of accounts.

**BUDGET, BUSINESS.** A budget, defined in its simplest terms, is merely an estimate of future needs. These needs may be for money, for labour, for materials, for advertising, for sales, for production, for capital expenditures, for personnel, or for any item of either income or expense. Nevertheless the business budget remains merely an advance estimate of the needs of the company for a definite future period.

Budgetary control, however, involves not only estimates of income and expense but implies a plan whereby these are logically related one to the other and actual income and expense definitely controlled in relation to the plans. Any plan of budgetary control must of necessity be closely co-ordinated with the organization structure of the company and with the policy making and

managerial elements. Rightly conceived and administered, a budget plan is of inestimable value to the business manager. By means of the budget, responsibility is definitely fixed, a better co-ordination of all activities is assured, a barrier to unwise expansion is established, a proper relationship between income and expense is maintained and a guide set up by which estimated and actual results may be checked one against the other periodically. Budgeting is not a substitute for good management. It is, however, one of the most practical and useful tools of management and accountability available, insuring as it does, considered planning before doing and replacing "hindsight" with "foresight."

The basic principles of successful budgetary control are simple and few in number. In the first place, executive support of both the principle and plan of budgetary control is absolutely essential. Indeed, unless all the executives of the company, from the chairman of the board of directors and the president down to the least important department supervisor, are in full accord and sympathy with the principle of planning, the success of the budget is in danger. Nothing so retards the success of any plan or method than to have it known that it has only the lukewarm sympathy and support of the principal executives. A budget should not be regarded, either by those working under it or by those administering it, as restrictive in character. Budgets must be elastic and flexible to meet changing conditions. Another important principle of budgetary control is that those who are to execute plans should have a definite and active part in making them. A salesman, for example, who is asked to assist in setting his own quota, is much less likely to complain about its size or to present alibis, than is one who has been assigned a quota by his sales manager or other superior without previous consultation.

Regardless of the size of the organization, the number of people affected and the nature of the business, it is essential that the procedure for budgetary control be kept as simple as possible. An example of what can be done in this connection is found in the case of one of the largest meat-packing companies in the United States, having sales in excess of \$900,000,000 a year, which operates under a plan of budgetary control covering all phases of its business. This company, however, finds it necessary to have only six people in its budget department, including the director of budgets. In order to give practical effect to the principle of operating the business in accordance with plans made, it is necessary that provision be made for frequent comparisons between estimated and actual performance. Such comparisons should be provided for at least once a month, with summaries every three months. One real danger, especially in a company's early experience with budgeting, is that estimates made will be merely optimistic hopes rather than real expectations of accomplishment. Expenses are budgeted in relation to anticipated income. If actual income falls far short of the budget, net profits will be reduced unless the situation is noticed in sufficient time to reduce expenses in the same proportion. Finally, it is essential that plans once made be adhered to except in cases where sound business judgment indicates that changes are desirable. As someone has expressed it, "Manage through your budget; don't let it manage you."

Actual responsibility for the direction of the budget plan rests with different executives in different companies. The plan under which the controller or the treasurer assumes the duties of budget supervision is by far the most widely used. Under this plan of organization, it is usual to find someone with the title of budget director, head of the budget department, supervisor of budgets, or controller of the budget, reporting directly to the treasurer or controller. In a relatively few cases, a person with title of assistant to the president is the administrator of the budget plan. Whatever the title of the executive in charge of budgeting may be, it should be clearly understood that he is representing the president in the discharge of his duties.

One of the most important budgets and yet, undoubtedly, the one which it is most difficult to prepare, is the sales budget, which shows both anticipated income from sales as well as quantities which it is expected will be sold. Best practice favours the separation of sales income from sales expense. In preparing the

sales budget, the three fundamental factors of probable market conditions, past sales, and plans and policies of the company for the coming year are used. Of these three, the first is the most difficult to deal with. During recent years a great deal of attention has been given to market analysis, both by companies themselves as well as by research organizations. While space does not permit of a detailed discussion of this important phase of budgeting, it should be clearly understood that a thorough market analysis must necessarily precede the preparation of a sales budget. After the sales budget has been prepared, the next step is the co-ordination of the estimated sales volume and income with other factors. In the case of a manufacturing business it is obvious that the sales estimate must be co-ordinated with the production capacity of the plant and that inventories must also be considered. Likewise, it may be necessary to make the original sales estimate conform to such factors as the ability of the company to finance the contemplated sales programme, the percentage of selling expense, anticipated net profits, advertising plans, personnel available to carry out the sales estimate, etc.

While the modification of the sales budget is being carried on, but after the original sales estimate has been prepared, other executives are preparing various expense budgets. A detailed budget of selling expenses must be drawn up. The advertising appropriation or budget must be prepared. If a manufacturing business, a production budget is necessary. Similarly, a budget of materials and supplies needed to fabricate the finished product, or in the case of a department store, the amount of goods to be purchased to supply the anticipated sales demand, must be drawn up. In the preparation of this latter budget, inventory requirements, minimum and maximum quantities and turn-over are given special consideration. In every business a budget of general overhead expenses, including such items as interest, taxes, general operating expenses, administrative expenses, is necessary. Similarly, a budget covering capital expenditures for additions and replacements to plant and equipment, including proper allowances for depreciation and obsolescence, is essential. Upon completion of all of the budgets mentioned, the executive in charge of the budget plan prepares the master or financial budget. This budget is very largely a consolidation, by totals only, of the individual departmental and functional budgets previously prepared. In a growing number of cases, estimated balance sheets and profit and loss statements are being prepared from the financial budget. Since the balance sheet and the profit and loss statement are the two accepted financial statements which summarize the past activities of the business from a financial point, it is only logical that the plans be finally put into estimated statements of the same kind. Banks throughout the United States are more and more asking companies to whom they extend accommodations, to submit estimated financial statements of this kind.

One test of the success of any budget plan is the way in which it works in everyday practice under actual operating conditions. To make the budget function properly, executive support, as has been said, is absolutely essential. In addition, frequent comparisons between estimated and actual results are necessary. A few companies have taken further steps in this direction by offering to executives, department heads, foremen and others, bonuses for the operation of the units for which they are responsible, below the estimated figures. A smaller number of companies have prepared manuals descriptive of their budget procedure. Such manuals not only serve to inform the entire organization, in a specific way, of the general plan of budgetary control, but contain specific directions for the detailed procedure involved in preparing each budget, which are most helpful to all who are concerned with budget making.

In summary it may be said that the principle of budgetary control is not new. For many years it has been applied successfully by governments, municipalities, charitable institutions and individuals. Informally, too, it has been applied by business organizations. With the growing necessity, however, for better management and the increasing realization that planning in advance is an integral part of good management, the budget has found its way into use in an increasing number of companies.

**BUDGET, FAMILY.** For the control of family expenditure (and for individual expenditure as well) the budget is coming more and more into use. A budget is a plan for the use of a given amount of money, a plan made under specific headings. Accounts are kept under the same headings, so that the budget plan can be constantly checked, and unless they are so kept, the budget becomes useless. On the other hand, household accounts have little value unless they are so kept as to make them the basis for planning future expenditure.

Attention was first called to the subject in the United States by Ellen H. Richards in *The Cost of Living* (1899). Statistics of family expenditure have been collected by Government departments, by economists and by welfare societies. These have been chiefly for low income levels and have been used in consideration of the minimum wage, the "decency level" and the "comfort level" for wage earning and dependent families. Some data have been collected regarding the use of larger incomes, but not to the same extent as for the low incomes. "Model" or "ideal" budgets for given incomes have been issued from many sources, to be used as a basis only, since the budget must be an individual matter with each family. Dr. Ernst Engel in 1857 enunciated his "laws" for the budget, stating that in the wage earner's family as the income increases the percentage spent on food decreases, while the percentages spent on clothing, housing and general operating expense change very little. F. H. Streightoff in *The Standard of Living* (1911) has re-stated these laws for American conditions. There seems to be a general agreement that rent should not exceed 25% of the income, that clothing should not exceed 15% or 20%, and that savings must be at least 10% for safety. The savings possibilities must vary with family conditions, 10% being impossible to many with low incomes and large families, while 50% is quite possible to others; 10% provides for emergencies, but would rarely be enough to produce an old age income.

The United States Treasury department, during and after the World War of 1914-18, did much to promote the use of the family budget. The bureau of home economics of the United States department of agriculture is still carrying on this work. Many of the mutual savings banks have established a "home bureau," the head of which acts as budget consultant. A few department stores have done the same, and some newspapers and women's magazines are running special budget departments. The national thrift committee has a sub-committee on the subject, and presents the budget all the year round as one of its seven points of thrift.

The purpose of the budget is to enable the family, by taking a long look ahead, to decide how it wishes to use the income available. It is seldom advisable to make it for a shorter period than a year. A plan, properly checked by accounts, ensures wiser expenditure than is possible in day-to-day spending without a plan. The family budget is made by husband and wife together, as senior partners, or by other heads of a family. Older children are often called into counsel as junior partners. The large items of rent, food and clothing are first considered, then other headings in detail. Good budget-making allows no miscellaneous or sundries heading, as the object is to control expenditure, and such headings are not easily controlled. Allowances for personal expense are usually made to some members of the family, including children old enough to keep accounts. In good budget-making it is always stated definitely what such an allowance must cover. In the family accounts only the amount of the allowance as paid is recorded, but certainly for children a simple budget and accounts should be required. For the expenditure under each of the headings some member of the family is responsible. In the average family, the wife controls the spending under most of the headings, and it is her part not only to keep the accounts carefully, but also to use the money as wisely as possible.

Different budget headings are recommended by different advisers, and many printed forms of accounts are distributed by banks, insurance companies and others. The family should choose with care the form best suited to its needs. Since unexpected

expenses may occur at any time, readjustment of the budget plan must often be made. If one heading calls for more money, another or others must have less, and which shall lose must be considered. The budget should never be looked on as an iron-bound restriction of expenditure, but rather as a plan that can at any moment be changed to fit changing needs.

One important purpose of the budget is to secure regular savings (of the amount possible to the family), which are difficult to make if the income is not carefully apportioned. The savings bank may be used for an emergency fund or for funds for special purposes of the near future. The budget makers study savings and investments, with the purpose to be served by each; whether the home shall be owned or rented; whether the family should make investments on which they can realize quickly in case of need, or may choose long-time investments to produce an old age income. Life insurance in its many forms must be studied, so that any policy taken fits the need which it will be or may be called on to meet. The careful consideration brought about by the use of the budget tends to ensure safe investments. When the husband and wife consider these together, the latter learns to judge of safety and advisability for herself, so that if she should be left with the responsibility, she is not at the mercy of her advisers. The family assets and liabilities are reckoned at the end of each budget year, and the gradual growth of the net assets is both a reward and a stimulus.

The advocates of the budget believe it to be of the greatest value, not only because by the control of expenditure the family is in safer condition financially, but also because the family ideals are better maintained when a long-time plan is made.

See C. W. Taber, *The Business of the Household* (1918); I. E. Lord, *Getting Your Money's Worth* (1922), *The Family Budget* (1924); S. A. Donham, *Spending the Family Income* (1923). (I. E. L.)

**BUDINI**, an ancient nation in the north-east of the Scythia (q.v.) of Herodotus (iv. 21, 108, 109), probably on the middle course of the Volga about Samara. They are described as grey eyed and red haired, and lived by hunting in their thick forests. They were probably Finns of the branch now represented by the Votiaks and Permiaks, forced northwards by later immigrants. In their country was a wooden city inhabited by a distinct race, the Geloni, who seem to have spoken an Indo-European tongue. Later writers add nothing to our knowledge, and are chiefly interested in the tarandus, an animal which dwelt in the woods of the Budini and seems to have been the reindeer.

**BUDWEIS**: see BUDEJOVICE.

**BUECHELER, FRANZ** (1837-1908), German classical scholar, was born in Rheinberg on June 3, 1837. He held professorships successively at Freiburg (1858), Greifswald (1866), and Bonn (1870), and in 1878 became joint-editor of the *Rheinisches Museum für Philologie*. Among his editions are: *Frontini de aquis urbis Romae* (Leipzig, 1858); *Pervigilium Veneris* (Leipzig, 1859); *Petronii satirarum reliquiae* (Berlin, 1862; 3rd ed., 1882); *Hymnus Cereris Homericus* (Leipzig, 1869); *Q. Ciceronis reliquiae* (1869); *Herondae mimiambi* (Bonn, 1892). He wrote also *Grundriss der lateinischen Deklination* (1866); *Das Recht von Gortyn* (Frankfurt, 1885, with Zitelmann); and supervised the third edition (1893) of O. Jahn's *Persii, Juvenalis, Sulpiciae satirae*.

**BUELL, DON CARLOS** (1818-1898), American soldier, was born near Marietta (Ohio), on March 23, 1818. He graduated at West Point in 1841, and was company officer of Infantry in the Seminole War of 1841-42 and the Mexican War, winning the brevet of captain at Monterey, and that of major at Contreras-Churubusco. From 1848 to 1861 he acted chiefly as assistant-adjutant-general. On the outbreak of the Civil War he was appointed lieutenant-colonel, then brigadier-general of volunteers, and major-general of volunteers in March, 1862. He aided in organizing the Army of the Potomac, and was sent, in Nov. 1861, to Kentucky to succeed Gen. William T. Sherman in command. Here he organized and trained the Army of the Ohio, which to the end of its career retained a standard only surpassed by that of the Army of the Potomac. In the spring of 1862 Buell followed the retiring Confederates under Sidney Johnston, served

under Halleck in the advance on Corinth, and in the autumn commanded in the campaign in Kentucky against Bragg. A period of manoeuvring virtually ended in the indecisive battle of Perryville. The alleged tardiness of his pursuit, and his objection to a plan of campaign ordered by the Washington authorities, brought about his removal from command. The complaints made against him were investigated in 1862-63, but the result was not published. Subsequently he was offered military employment, which he declined. He resigned his volunteer commission in May, and his regular commission in June 1864. He died near Rockport (Ky.), on Nov. 19, 1898.

**BUENAVENTURA**, a Pacific port of Colombia, in the department of Valle, about 210 m. W.S.W. of Bogotá. Pop. in 1918, about 5,000. The town is situated on Cascajal, a small island, at the head of a broad estuary or bay projecting inland from the bay of Chocó and 10 m. from its mouth. The estuary is deep enough for vessels of 20 ft. draught and affords an excellent harbour. Buenaventura is 360 m. from Panama and is the first port of call south of the canal for several lines of steamers. It is the Colombian landing-place of the West Coast cable. The town has a very unhealthy climate, oppressively hot and humid. It is the port for the upper basin of the Cauca, an elevated and fertile region, with two large commercial centres, Popayán and Cali (with which it is connected by rail), and also for the gold and platinum districts along the upper San Juan river.

**BUENA VISTA**, a battleground of very rugged terrain, situated about 8 m. south of Saltillo, Mexico. There on Feb. 23, 1847, was fought the final engagement of the northern campaign of the war between Mexico and the United States (1846-48). Gen. Santa Anna, with some 20,000 Mexicans, moved north in order to overpower Maj.-Gen. Zachary Taylor's forces which, owing to dispersals and changes, numbered not more than 5,000 men. The coup was planned with cunning and the U.S. troops would have been at a disadvantage, had the Mexicans displayed more aggressiveness. As it was, the main American camp was surprised and withdrawn to Buena Vista. Col. Wool was left in command by Taylor, who went back to Saltillo to prepare that place for defence. Although Wool had selected the site and disposed his troops well, before nightfall (Feb. 22) the defenders of the mountain pass in front had been repulsed. Next morning the Mexican army in force came through the pass, and nearly outflanked the troops who had re-ascended the mountain, when Washington's battery began to have a telling effect. In the centre, a regiment and a half of State troops fled before the Mexican onslaught. Other dragoons of militia, being cut off, withdrew in panic. Although Bragg, Sherman and O'Brien trained their guns on the Mexicans against great odds, the way to the Americans' rear lay open. Though Taylor's appearance on the scene lent confidence, he uttered so few directions that the initiative fell upon his trained subordinates. Col. Jefferson Davis with his Mississippians and Col. Bowles with the remaining Indianians charged and repulsed Ampudia's cavalry. Col. Davis, painfully wounded and bleeding, refused to leave his saddle until the field was secure.

Gen. Taylor ordered Hardin to charge a large force of Mexicans in front. Although Bissell, McKee and Thomas joined in the attack, the Mexicans overwhelmed them. Hardin, McKee and Henry Clay perished, standing to the last. But Bragg and Sherman galloped from another part of the field with their tired batteries, and some of the Indiana and Mississippi regiments charged the enemy's flank and rear. Col. Davis was carried to his tent as the Mexicans began their retirement. Taylor had lost over 2,000 men, dead, wounded or missing in the engagement. The Mexican losses are variously estimated but were doubtless heavy. Even though Santa Anna was still stronger in numbers, he withdrew to the south, fearing to risk another engagement.

Ganoe, *The History of the United States Army* (1924); *Original Correspondence and Reports in Old Files Section*, Adjutant General's Office (Washington, D.C.).

(W. A. G.)

**BUENOS AIRES**, the Province of Buenos Aires is one of the 14 States which together with 10 Territories (*gobernaciones*) and the Federal district form the nation Argentina. It is bounded north by the provinces of Córdoba, Santa Fé and Entre Ríos, the last named separated by the river Paraná; east by the La Plata estuary which separates it from the Republic of Uruguay, and by the Atlantic ocean; south by the Atlantic and the territory Río

WEATHER GRAPH OF BUENOS AIRES. THE THERMOMETER REGISTERS THE ANNUAL MEAN TEMPERATURE. THE CURVE SHOWS THE MONTHLY MEAN TEMPERATURE AND THE COLUMNS INDICATE THE NORMAL PRECIPITATION FOR EACH MONTH

Negro from which it is separated by the river of the same name; west by the territories of Río Negro and La Pampa and the Province of Córdoba. The province is situated between 33° 8' and 41° 4' S. lat. and 56° 36' and 63° long. W. from Greenwich. Its area is approximately 118,460 sq. m.

**Physical Features.**—Although the province has a frontage of about 1,000 m. on the La Plata and the Atlantic and nearly 310 m. bounded by the Paraná in the north and the Río Negro in the south, it has but few good natural ports, the best being Bahía Blanca, where the Argentine Government has constructed a naval port, and Ensenada de Barragán (La Plata), where extensive artificial basins have been constructed for the reception of ocean-going steamers. San Nicolás and Zárate, on the Paraná, have fairly good ports, while at Buenos Aires and Mar del Plata (a fashionable seaside resort) extensive artificial ports have been constructed. In its general aspect the province forms a part of the great treeless plain extending from the Atlantic and La Plata estuary westward to the Andes. A fringe of small tangled wood covers the low river banks and delta region of the Paraná between San Nicolás and Buenos Aires; thence southward to Bahía Blanca the seashore is low and sandy, with a zone of lagoons and partially submerged lands immediately behind. The south-eastern and central parts of the province are low and marshy, with numerous lakes. Two ranges of low mountains extend partly across the southern part of the province—the first from Mar del Plata, on the coast, in a north-east direction, known at different points as the Sierra del Volcán, de los Padres, Azul, Tandil and Olavarrá. The second and shorter range starts near Bahía Blanca, has the same general direction as the above, and is known at different points as the Sierra Pillahuinco and Sierra de la Ventana (3,543 ft.). The country is well-watered with numerous lakes and small rivers, the largest river being the Río Salado del Sud, which rises near the north-west boundary and flows entirely across the province in a south-easterly direction with a course of about 360 miles. The Río Colorado crosses the extreme southern extension of the province, a distance of about 80 m., but its mouth is obstructed, and its lower course is subject to occasional disastrous inundations.

The climate, healthful and mild, is generally temperate; although sudden changes are frequent. The rainfall is very irregular, varying from an annual precipitation of about 32 in. in the north to about 10 in. in the extreme south.

**Population.**—The province is not only the largest but also the most populous, even excluding the Federal district, in the republic.

The official census of 1914 gave it a population of 2,066,165, of whom 703,931, or 31% were foreigners. The most numerous of the foreign element are Spanish, Italian and French, however, there are also Germans, English and other nationalities. An official estimate of Sept. 30, 1926 gave it a population of 2,762,525, or a density of 9.1 persons per square kilometre. The principal cities with their estimated populations in 1926 were: Avellaneda (182,000), an important industrial centre adjacent to the city of Buenos Aires; La Plata (162,000), capital of the province and its chief overseas shipping point; Bahía Blanca (70,000), an important Atlantic port; Lanús (38,000); Mar del Plata (35,000), a famous seaside resort; and Chivilcoy, Mercedes, Lomas de Zamora, Junín and Pergamino, all having something over 30,000 inhabitants. San Nicolás, Azul, Quilmes, Tres Arroyos, Tondil, San Fernando, Ensenada, Dolores, Chacabuco, San Martín and Zárate have populations varying from 15,000 to 30,000.

**Government.**—Considerable legislative and administrative power is vested in the provincial Government. The executive is a governor, who, with a vice-governor, is elected by popular vote for four years. The legislature consists of a senate and a chamber of deputies. The judiciary comprises the supreme court, and courts of appeal in La Plata, and civil, commercial and criminal courts in La Plata, San Nicolás, Mercedes, Dolores, Bahía Blanca and Azul. The province is divided into 110 *partidos*, or districts, each with a justice of the peace and certain administrative officials.

**Education.**—According to the census of 1914, 30.8% of the population was illiterate: the percentage, however, is rapidly being lowered. In 1924 there were 2,401 schools in the province, attended by 320,136 pupils. There were national secondary schools in all the principal cities and a national university at La Plata.

**Live Stock and Agriculture.**—A mild climate, an abundant rainfall (except in the extreme south) and a humid soil have all contributed to endow the province with an abundant vegetation, not only in its rich, natural pastures, but also of cultivable plants suited to the temperate zone. Cattle-raising quite naturally became the principal industry of this region soon after its settlement by the Spaniards, and sheep-raising on a profitable basis was developed about the middle of the 19th century. Toward the end of that century the export of wool, live stock and dressed meats reached enormous proportions. There is still a limited export of jerked beef (*tasajo*), but the chief exports are refrigerated meats and live stock, which go to the neighbouring South American republics, Europe, South Africa and the United States. Much attention has been given to the raising of horses, and, to a more limited extent, to mules and swine. There were in the province on June 1, 1925, according to a census of live stock of that date, 13,625,238 cattle, 12,488,936 sheep, 2,242,151 horses and 785,062 swine. Buenos Aires ranks first in the republic, alike for the number and the high quality of its live stock. Dairying has gained considerable prominence during recent years.

Little attention has been given to agriculture until the last quarter of the 19th century, but its subsequent development is tending more and more to displace the pastoral industry. Maize (Indian corn) and linseed are the chief crops of the north; in the centre and south-west wheat predominates; and in the south-east potatoes. Oats, barley, alfalfa, fruit and vegetables are less localized. About 30% of the area sown to cereals and linseed in the whole of the republic was in the Province of Buenos Aires. The land in actual cultivation increased from 3,400,000 ac. in 1895 to approximately 22,500,000 ac. in 1926. The areas and productions of the principal crops for the agricultural year 1925-26 are given in the table below:—

| Crop               | Area in acres | Production in tons |
|--------------------|---------------|--------------------|
| Wheat . . . . .    | 7,175,000     | 2,695,940          |
| Oats . . . . .     | 2,548,450     | 1,008,346          |
| Maize . . . . .    | 3,927,500     | 3,046,457          |
| Barley . . . . .   | 545,000       | 268,011            |
| Rye . . . . .      | 168,575       | 45,947             |
| Linseed . . . . .  | 1,425,000     | 478,407            |
| Alfalfa . . . . .  | 6,548,540     | ..                 |
| Potatoes . . . . . | 300,000       | ..                 |
| Vines . . . . .    | 9,143         | ..                 |

Fruit-growing—peaches, grapes, pears, strawberries and figs—has made good progress, especially on the fertile delta of the Paraná river.

**Industry and Transportation.**—Buenos Aires also ranks first as regards industrial and commercial development and means of transportation. Chief among the manufacturing establishments were meat refrigeration plants, flour-mills, creameries and cheese factories, breweries, distilleries, foundries, tanneries, boot and shoe factories and numerous industries with a smaller output. Meat refrigeration is by far the chief industry, representing in 1925 a capital investment of 231,202,296 pesos. In that year the refrigerating plants slaughtered 3,104,519 cattle, 4,174,438 sheep and 107,949 swine. The products of the factories with those of agriculture give rise to an extensive commerce, both domestic and foreign.

Because of the difficulties of navigating the Paraná, the greater part of the trade of the northern and western provinces must pass through the ports of Buenos Aires and La Plata, at which an immense volume of business is concentrated. All the great trunk railways of the republic pass through the province and converge at these ports, and from them a number of transatlantic steamship lines carry away the products of its soil and factories. The province is also liberally supplied with branch railways, bringing the total mileage to approximately 8,300. Bahía Blanca, in the south, has become prominent in the export of wool and wheat. Highways and motor transportation are increasing rapidly.

**History.**—The early history of the Province of Buenos Aires was a struggle for supremacy over the other provinces for a period of two generations. Its large extent of territory was secured through successive additions by conquest of adjoining Indian territories south and west, the last additions being as late as 1879. Buenos Aires became a province of the Confederation in 1820, and adopted a Constitution in 1854, which provides for its administration by a governor and legislature of two chambers. An unsuccessful revolt in 1880 against the national Government led to the federalization of the city of Buenos Aires (185.12 sq.km.), and the founding (1882) of La Plata as the provincial capital, the republic assuming the public indebtedness of the province at that time, as an indemnification. Liberal laws as regards immigration and foreign capital have caused the province to grow rapidly in both population and material wealth.

See *The Times Book on Argentina* (1927), published by the London Times; *La Provincia de Buenos Aires* (1926), official publication of the Dirección General de Estadística de la Provincia de Buenos Aires; and the *Boletín Mensual* issued by the above-named office.

**BUENOS AIRES**, the capital, and chief port of the Republic of Argentina, is situated in a Federal district of 72 sq.m. which lies along the western shore of the Plata river estuary. The city is about 125m. from the Atlantic ocean in 34° 36' 21" S. and 58° 21' 33" W. It is only about 65ft. above sea-level. The population in 1927 was about 2,000,000. The city is laid out on the "checkerboard" plan with streets intersecting at right angles. Of the business streets Avenida de Mayo stands first; it is 120ft. wide, extending from Plaza Mayo to the Palacio del Congreso, for about a mile. Its striking features are the uniformity of height (generally six to eight stories) and fine architecture of the buildings. It has a double row of lights along the middle, and is lined with trees. The city's architecture, largely of the French Renaissance, has been promoted by the municipality's annual award of prizes for the most attractively designed business and residence building. The city has more than a hundred parks covering a total area of 3,000 acres. The largest is Parque 3 de Febrero, at the suburb of Palermo, one of the most popular resorts, reached by splendid boulevards. The principal square of the city is the Plaza de Mayo, on to which front the Government palace, the Banco de la Nación and the historic cathedral in which repose the remains of the Argentine hero, Gen. San Martín. Other notable buildings are the Colon theatre, the Palace of Justice, the Capitol, the opera house, the Jockey club, etc.

Since 1921 annual building permits for the city have ranged from 13,500 to 27,360; the value of these structures ranges from 115,422,000 to 226,149,000 pesos (peso equals about 42 cents of United States Currency). Among new structures are several government buildings, some of which are seven stories in height.

Extensive property areas have been appropriated for municipal improvements; land lying between Plaza San Martin and the water front was being prepared in 1928 for a public park, the estimated cost of which is given at 5,000,000 pesos. The city street railway system is excellent. Average daily passenger traffic amounts to more than 1,100,000. The subway extending from the Plaza de Mayo to Plaza Once, for more than a mile is to be

THE COLON THEATRE IN BUENOS AIRES, CONDUCTED UNDER MUNICIPAL MANAGEMENT, AND DEVOTED CHIEFLY TO GRAND OPERA. IT IS SAID TO HAVE BEEN ERECTED AT A COST OF \$1,700,000

prolonged in order to relieve serious surface congestion. The growth of manufacturing industries in recent years is reflected by the fact that factories have increased to a total of more than 11,000 and the capital invested in them has increased nearly 500%. Much of the manufacturing is done in the region of the Riachuelo river.

The seasons at Buenos Aires are the reverse of those prevailing in regions at about the same latitude north of the equator. June, July and August are the coldest months and embrace a large part of the periods of rains, although precipitation comes before and after these months, whose average temperature is 50° F; September, October, November average 60° F; December, January, February 72° F; March, April, May 62° F. The annual rainfall is 894mm.; 112 days of the year are classed as 50% cloudy; 115 are more than 50% cloudy. A hundred miles out on the pampa there is much more sunshine than at Buenos Aires, a condition largely attributable to the expanse of river estuary in the region of the capital.

**Port Facilities.**—In official operation the port of Buenos Aires includes that of La Plata, 40m. nearer the ocean. For 18m. below Buenos Aires the Plata has been dredged to a depth of 26 feet. From March to May annually the river is at its highest stage and consequently admits the largest ocean-going vessels; at other times it may be necessary for ships to dock at La Plata. From the main river channel opposite Buenos Aires there are two dredged channels leading to the port; these are known as the north and south channels, respectively. The latter approaches the port directly opposite the mouth of the Riachuelo, a small river flowing through a section of Buenos Aires. The Riachuelo is dredged to sufficient depth to receive average ocean-going ships. On both sides of this river there are many industrial plants, including the great wool market known locally as the Mercado de los Frutos; here also are several of the largest meat packing establishments. Between the north and south channels and slightly inland from the Plata shore four large ship areas have been constructed. A special feature of the port is the number of railway tracks that have been constructed, connecting with various railway terminals a short distance away. Also connected with the railways and the port are the numerous industrial establishments. As a fuel station Buenos Aires maintains a supply of 35,000 to 40,000 tons of coal; annual importations amount to nearly 2,000,000 tons of coal. Buenos Aires possesses docking facilities for any ship that is not of too great draught to navigate the Plata. Through the ports of Buenos Aires and La Plata, operated as a single port, there passes from 60 to 70% of the country's commerce.

**Government.**—The government of Buenos Aires is composed of two branches, executive and legislative. The latter is known as the "concejo deliberante," and corresponds to the city council

of other municipalities. It consists of 22 councillors elected by the people for four years, half of the body retiring by rotation every two years. Members serve without salary; and to be eligible to a seat in this body a citizen must be over 25 years of age, a registered voter, able to read and write, must have paid into the treasury a tax for some industrial or commercial business to the amount of 500 or more pesos. The head of the executive branch is the "intendente municipal," or mayor, who is appointed by the president of the republic, subject to the approval of the senate. He holds office for three years and is eligible for reappointment. The administrative functions of the council relate to finance, public works, public health and morality. In its jurisdiction over the financial matters of the city the council determines the taxes to be levied and fixes fines up to 500 pesos for infractions of the law.

Buenos Aires, in addition to being a municipality, is also the capital of the republic, and as such has intimate connection with the Federal Government. Through the intendente matters pertaining to the welfare of the municipality are presented to the National Congress whenever necessary, and he, as the representative of the National Government, is empowered to present to the municipality matters affecting it that have originated in Congress. Other manifestations of this dual character of the city are to be found in the police and fire departments, under the control of the Federal Government, which meets the expenses of these departments. Certain branches of the educational system, and also the sanitary regulations of the city, carried out by means of a national department of public service—the Asistencia Publica—are partly national in character.

Public sanitation is directed by two organizations, one national, the other municipal. The first body controls conditions that directly affect the country by virtue of the city's being the gateway to the republic. The second body has charge of municipal laboratories, conducts bacteriological examinations and disinfecting activities, and controls the relief services that respond to emergencies. The city's water supply and sewer system are departments of the National Government. Water is obtained from the Plata far enough up stream to avoid pollution, the supply being taken from wells bored beneath the surface of the river. At central stations this water is purified further by sedimentation and filtration. The sewerage system discharges into the Plata below the city, whence it is carried out to sea. Gravity not being sufficient, a series of pumps and relief sewers are in use.

**Education.**—The public school system is partly national and partly municipal, although the schools are under the supervision

THE PLAZA DEL CONGRESO, SHOWING THE PALACE OF CONGRESS. Situated at the opposite end of Avenida de Mayo, a tree-lined street about a mile in length, this plaza is one of the largest and most beautiful in the city. It was built in 1910 to commemorate the first centenary of the Revolution de Mayo

of the National Government. There are primary, secondary, commercial, industrial schools, and schools of a collegiate character. The University of Buenos Aires provides courses leading to doctors' degrees. There are numerous fine art institutions and special instruction is available for the deaf, dumb and blind. Primary education is free and compulsory for children from six to 14 years of age. Educational work is supported largely from the national treasury and from certain funds provided by municipal taxes. The city is well supplied with free libraries, including the National,

Mitre, Municipal, Typographic Society's library, Popular, La Prensa library, National Library of Masters, Velez Sarsfield Public Library and others.

**History.**—In 1515 Juan de Solis sailed his vessels into the water known to-day as the Plata river, believing that he had found the route to the Indies. Solis and his party were the first Europeans to reach this waterway, but the leader never lived to tell the story. On the north shore of the river he and most of his followers met their death in an encounter with the wild Charruas. Five years later another European expedition arrived, headed by a Portuguese, Ferdinand Magellan, in the service of the emperor, Charles V. Magellan followed the coast of the country and finally discovered a watercourse leading to the East. In 1527, Sebastian Cabot, the Venetian, who had resigned from the service of England for that of Spain, was sent by Charles V. to determine the line of demarcation between the colonizing spheres of Spain and Portugal; learning of inland regions abounding in silver, he decided to move up the river. In 1535 another expedition, commanded by Pedro de Mendoza, landed on the present site of Buenos Aires. This event marks the first serious attempt of Europeans to establish themselves within the bounds of what is now Argentina. The native Indians proved hostile, after a time conditions became desperate, and Mendoza himself decided to return to Spain, but died on board ship before reaching there. Those he left behind, also discouraged, migrated farther up the Plata and the settlement started by Mendoza soon disappeared. In 1580 Juan de Garay arrived with other adventurers and re-occupied the site that Mendoza had abandoned. Garay called the place La Trinidad, and the actual landing site on the river's bank was christened Port Santa Maria de Buenos Aires. As time passed the settlement became known simply as Buenos Aires (Span. "good airs").

The settlement had grown to a village of several hundred people by 1650. Most of the houses were constructed of stone and mud and had thatched roofs, although a few were roofed with tile. Dwellings were low, many not more than 12ft. high. The plaza of Santo Domingo convent became a general trading mart. There seems to have been a census-taking in 1664, when the town had 211 families or a population of more than 1,000 people. Cattle were imported from the Old World, and from this early beginning was thus developed the great pastoral industry upon which largely rest Argentina's progress and wealth to-day. (W. A. R.)

**BUER**, a mining and engineering town in the south-west of the district of Münster in the Prussian province of Westphalia. Pop. (1925) 99,307. It has grown very rapidly. Its position on the watershed between the Emscher and the Lippe and its fine woodlands give it special advantages which are enhanced by the proximity of the river ports.

**BUFF**, a dull yellow leather originally made from the skin of the buffalo (Fr. *buffle*, a buffalo), now also from the skins of other animals; used for making the military buff-coat or jerkin. The East Kent Regiment and the 2nd battalion Seaforth Highlanders are called the "Bufs" and the "Ross-shire Bufs" respectively, from the yellow or buff-colour of their facings. The term is commonly used now of the colour alone.

**BUFFALO**, a city and port of entry, and the county seat of Erie county, New York, U.S.A., the second city in population in the State, at the eastern extremity of Lake Erie and at the upper end of the Niagara river, distant by rail from New York city 423m., from Boston 499m. and from Chicago 540m. It has an area of 42 sq.m. The site of the city is on a broad, undulating tract of ground, rising gradually from the lake to an elevation of 50 to 80ft. its altitude averaging somewhat less than 600ft. above

GRAIN ELEVATORS ALONG THE WATER FRONT OF BUENOS AIRES

sea-level. The high land and temperate climate and the excellent drainage and water-supply make Buffalo one of the most healthful cities in the United States. As originally laid out by Joseph Ellicott, the plan of Buffalo resembled that of Washington. It has broad and spacious streets, most of which are lined by trees. The municipal park system consists of a chain of parks with a total area of 1,342ac., encircling the city and connected by boulevards and driveways. The largest is Delaware park, about 365ac., including a lake of 46½ac., in the north part of the city; the west part of the park was enclosed in the grounds of the Pan-American Exposition of 1901.

**Buildings and Monuments.**—Buffalo is widely known for the beauty of its residential sections, the houses being for the most part detached, set well back from the street and surrounded by attractive lawns. The Federal building, county hall, city hall and State office building provide quarters for various branches of governmental work. The chamber of commerce is the centre of business activity. There are three State armouries. An auditorium and a music-hall are owned by the city. The Albright art gallery and the building of the Buffalo Historical Society, which houses a library and a museum, stand in Delaware park. The museum of the Buffalo Society of Natural Sciences is in Humboldt park. A monument in memory of President McKinley distinguishes Niagara square, around which is the civic centre. A soldiers and sailors' monument, commemorating Civil War veterans, is in Lafayette square; a statue "The Hiker" appropriately recalls the Spanish War, and the figure of Commodore Oliver Hazard Perry at The Front preserves the memory of the commander of the American squadron in the battle of Lake Erie on Sept. 10, 1813. In Forest Lawn cemetery are the monuments to President Millard Fillmore and the famous Seneca chief Red Jacket (1751-1830), a friend of the whites, who was faithful when approached by Tecumseh and "the Prophet," and warned the Americans of their danger. Churches include St. Joseph's (Roman Catholic) and St. Paul's (Protestant Episcopal) cathedrals, and Trinity (Protestant Episcopal), Westminster Presbyterian, Delaware Avenue Baptist, Delaware Avenue Methodist, First Presbyterian and others.

**Education.**—In addition to the usual high and grammar schools, the city supports a training school for teachers and a system of night schools, kindergartens and vocational schools, including a vocational high school. The State teachers' college at

**A VIEW OF INDUSTRIAL BUFFALO, SHOWING THE LARGE ORE UNLOADING CRANES AND FLOUR MILLS AT THE END OF THE STATE BARGE CANAL**  
Buffalo, developed from a State normal school, has expanded on a new site with enlarged and appropriate buildings. The University of Buffalo (organized in 1846) comprises schools of medicine (1846), pharmacy (1886), law (1891), dentistry (1892) and arts and sciences (1913). The university in 1909 under Chancellor Charles P. Norton acquired a new site of 106ac. in the northern part of the city, to which 44ac. were added in 1919. In 1920 an endowment fund of \$5,177,000 was raised by popular subscription, since increased by other gifts and bequests. Samuel P. Capen became chancellor in 1922. A unique gift by the will of

the late Chancellor Norton provides for the conferring by the university annually of a civic medal to the citizen of Buffalo who is adjudged to have done the most distinguished service to the community and the world. The first medal was given in 1924 to Bishop Charles H. Brent, delegate of the United States to the international opium conference. Canisius college (Jesuit) was established in 1870 and chartered in 1883. In 1920 it raised by popular subscription an endowment fund of \$1,000,000 and with the erection of a new building began a notable expansion. D'Youville college for women (Roman Catholic) was opened in 1908. Other important schools are the Academy of the Sacred Heart, Buffalo seminary, Franklin school, Elmwood school, Holy Angels academy, St. Mary's seminary, St. Joseph's Collegiate Institute, Nardin academy, Mt. St. Joseph academy and Nichols school for boys. Important libraries are the Buffalo public (founded in 1837), the Grosvenor, a reference library founded in 1859, the Buffalo Historical Society library, which includes special collections, the law library (8th judicial district) and the Catholic Institute.

**Public Institutions.**—The new city hospital in Buffalo and the J. N. Adam Memorial hospital for tuberculous patients at Perrysburg (N.Y.), are maintained by the city. The Erie county home and infirmary occupies a farm site at Wende (N.Y.). The U.S. marine hospital is maintained by the Federal Government. Other important hospitals are the General, the Millard Fillmore, the hospital of the Sisters of Charity, the Children's, the Deaconess, the Columbus, the Lafayette, the Emergency, the Mercy, the Moses Taylor and the Providence Retreat. Among the charitable institutions are the Home for the Friendless, Buffalo and St. Vincent's orphan asylums, Children's Aid Society, Erie county lodging-house, Ingleside home for erring women and Le Couteux St. Mary's deaf-mute institution. The Charity Organization Society was founded in 1877, the first of its kind in the United States, and has been the model followed in many other cities.

The first newspaper, the *Gazette* (a weekly), was established in 1811 and became the *Commercial* (a daily) in 1835. The first daily was the *Western Star* (1834) which later became the *Courier*. There were in 1928 three English daily papers, the *News*, the *Courier-Express* and the *Times*.

**Government and Population.**—From 1916 to 1928 Buffalo had a commission form of government with legislative and executive powers united in five commissioners, chosen at non-partisan primaries and elections. A new charter went into effect on Jan. 1, 1928, which restored government by mayor and council with some original features. Nominations, though under direct affiliated primaries, are by party tickets. The elective officers are mayor, controller, president of the council, five councilmen at large and nine district councilmen. The mayor prepares the budget, and executive powers are strongly concentrated in his hands, with the council holding a check through the powers of taxation, appropriation and confirmation. The council sits as a unicameral body. The mayor, president of the council and councilmen at large may not be re-elected to succeed themselves after completing their four-year terms. The district councilmen, who are elected for two-year terms, may be re-elected once, but may not serve for more than four continuous years.

Buffalo's first census, taken in 1820, showed a population of about 2,000. A century of growth brought it in 1920 to 506,775, with a total of 602,847 in the metropolitan district (Buffalo and suburbs). The State enumeration of 1925 returned 538,016 and the Federal census figures of April 1, 1930 were 573,076. The population includes numerous elements of German, Canadian, Polish, Irish and Italian birth or descent.

**Commercial Importance.**—Situated almost equidistant from New York, Boston, Philadelphia, Baltimore and Chicago, at a natural junction point for lake and railroad transportation, Buffalo has become one of the leading commercial and industrial centres of the United States. Its annual record in tonnage handled usually ranks the city fourth or fifth among American ports. The outer harbour is protected by a breakwater 4½ m. long enclosing an area of about 680 acres. There are 37½ m. of water frontage, obtained in part by the development of the Buffalo river and

canals. Municipal piers supplement private dockage. Grain elevators have a capacity of about 40,000,000 bu. and handle from 200,000,000 to 300,000,000 bu. a year. The New York State barge canal gives water transport to the seaboard for barges up to 2,000 tons capacity. Eleven main railway lines make the city an exceptional centre for land transportation. Electric power is obtained in great part from Niagara Falls. Natural gas, piped from Pennsylvania and western New York fields and supplemented by manufactured gas, is an important source of fuel supply. An abundant water-supply is pumped from Lake Erie and a filtration plant protects its purity. A municipal airport provides adequate landing facilities for air-borne mails and commerce. Flour and grain products, iron and steel, rubber, linseed-oil and meat products stand among the city's most important manufactures. There is diversity in lesser lines of manufacture, of which some 60% of the Federal census classification is represented.

**History.**—The first white men to visit the site of Buffalo were undoubtedly the adventurous French trappers and various Jesuit missionaries. On the east bank of the Niagara river at the mouth of Cayuga creek, La Salle in 1679 built his ship the "Griffin," and at the mouth of the river built Ft. Conti, which, however, was burned in the same year. In 1687 Marquis Denonville built at the mouth of the river a fort which was named in his honour and was the predecessor of the fortifications on or near the same site later called Ft. Niagara. The neighbourhood was the scene of military operations up to the close of the Revolutionary War. As early as 1763 the present site of the city of Buffalo came to be known as the "Buffalo Creek region," either from the herds of buffalo or bison which, according to Indian tradition, had frequented the salt *licks* in the neighbourhood, or more probably from an Indian chief. In 1784 Ezekiel Lane and Michael Midgah became the first permanent white residents. The land was a part of the original Phelps-Gorham purchase. In 1797 it came into the possession of the Holland Land Company, being part of the tract known as the Holland purchase.

Joseph Ellicott, the agent of the company, who has been called the "Father of Buffalo," laid out a town in 1803, calling it New Amsterdam, and by this name it was known on the company's books until about 1810. The name of Buffalo Creek, or Buffalo, however, proved more popular. The village became the county seat of Niagara county in 1808, and two years later the town of Buffalo was erected. Upon the outbreak of the second war with Great Britain Buffalo became headquarters for most of the military operations on the Niagara frontier. Lieut. Jesse D. Elliott, U.S.N., established a navy yard on Scajaquada creek where several vessels were built that figured in later naval operations. On Oct. 9, 1812, he led an expedition which captured two merchant vessels moored under the guns of Ft. Erie on the Canadian side. On Nov. 30, 1812, Gen. Alexander Smyth made an unsuccessful attempt to cross the river and attack Ft. Erie. On July 11, 1813, a British force crossed the river and a sharp skirmish occurred within the present limits of Buffalo. On Dec. 30-31, 1813, a force of British, Canadians and Indians under Gen. Sir Phineas Riall (1769-1851) burned the greater part of Buffalo and Black Rock, with little resistance from the defending troops. The destruction, in which most of the other villages along the frontier were included, was an act of retaliation for similar devastation done by American troops in Canada. Gen. Jacob Brown from headquarters in Buffalo directed the troops which crossed the river and received the surrender of Ft. Erie on July 3, 1814. The army thence marched down the river to the vicinity of Niagara Falls where the battles of Chippewa (July 5) and Lundy's Lane (July 25) were fought. The American troops retired to Ft. Erie. A strong attack by the British was repulsed on Aug. 15, a portion of the fort being blown up. On Sept. 17 a sortie of the Americans against the British camp resulted in the abandonment of the siege for the time being. Another advance by the Americans as far as Chippewa was turned back in October and on Nov. 5, 1814, Maj.-Gen. Izard abandoned Ft. Erie and withdrew across the river to Buffalo.

After the war Buffalo was rapidly rebuilt. It was incorporated as a village in 1816. With the westward movement of immigra-

tion its prosperity increased. The first steamboat on the Great Lakes, "Walk-in-the-Water," was built in Buffalo in 1818. It was named in honour of a famous Wyandot Indian chief. The completion of the Erie canal in 1825 greatly increased the importance of the place. In 1832 Buffalo was incorporated as a city and Dr. Ebenezer Johnson was chosen as the first mayor. In that year and again in 1834 cholera epidemics caused considerable loss of life.

In the Civil War, Erie county, of which Buffalo is the chief city, furnished 15,249 men to the Federal army. Their casualties numbered 4,704. In 1882 Mayor Grover Cleveland of Buffalo was elected governor of the State of New York, and in 1884 was nominated and elected president of the United States. In 1901 Buffalo citizens organized the Pan-American Exposition with the purpose of promoting trade between the United States and other countries in this hemisphere. While attending this exposition, President William McKinley was assassinated by an anarchist, who had come to Buffalo for the purpose (Sept. 6, 1901). Vice-President Theodore Roosevelt took the oath of office as president in Buffalo.

Buffalo furnished over 10,000 volunteers and selected service men to the U.S. army in the World War. The greater number of these served in the 77th and 78th Divisions and had an active part in the Meuse-Argonne and other battles.

On Aug. 7, 1927, an event of international interest was the dedication of a vehicular bridge between Buffalo and Ft. Erie. Originally planned as a memorial to the 100 years of peace on the Canada-United States border it received the designation of the Peace bridge.

Babcock, *The War of 1812 on the Niagara Frontier* (1927).

(M. M. W.)

**BUFFALO** (*Bubalus buffelus*), a member of the ox family (Bovidae, q.v.), which, from time immemorial, has been a domestic animal in India, Malaya and Egypt, and has been introduced into Italy, Gascony and Hungary. The name has since been applied to all members of the genus, and, in America, to the bison (q.v.).

The Indian buffalo is larger than the ox, but is less docile. It is employed both for farm-work and as a draught animal. The cow gives much milk, very nourishing but of a peculiar flavour. The horns are long, widely separated and backwardly directed. In a wild state the animal haunts swampy marshes and, like the domestic specimens, loves to wallow in the mud. A larger Indian form is the arnee (*B. arni*). The male buffalo is quite a match for a tiger. Buffaloes form herds of 50 or more, which, however, break up into small parties, comprising a bull and three or four cows, at the rutting season.

The Cape buffalo (*B. caffer*) is distinguished by its shorter horns, the bases of which are immensely thickened and cover the whole forehead. Several well-marked varieties are known. In habits and size it resembles the Asiatic species, and ranges over south and central Africa. This animal is credited with great intelligence, and a wounded buffalo is almost a synonym for cunning and ferocity. They are among the most dangerous of big game and are treated with respect even by experienced hunters.

THE CAPE BUFFALO OF AFRICA. WHICH RESEMBLES THE ASIATIC SPECIES IN SIZE AND HABITS

THE INDIAN BUFFALO (BUBALUS BUFFELUS) DISTINGUISHED BY THE SPREAD OF THE HORNS, IS DOMESTICATED FOR FARM WORK

Several other species inhabit Asia and Africa, including the dwarf *B. nanus* from the west of the latter continent.

**BUFFALO-BERRY**, called also rabbit-berry and Nebraska currant (*Shepherdia argentea* or *Lepargyrea argentea*), a hardy North American shrub of the oleaster family (Elaeagnaceae), allied to the sea buckthorn (*Hippophaë rhamnoides*) of English coasts. The buffalo-berry is native to stream banks in the Great Plains region from Manitoba, Saskatchewan and Alberta southward to Kansas, New Mexico and Nevada. It grows from 6 ft. to 20 ft. high, with whitish, somewhat thorny branches and small, oblong, silvery leaves, and bears a profusion of oval, scarlet, red or golden-yellow berries, about the size of currants. The fruit has a pleasant tart flavour and makes a good meat relish, jelly, sauce or conserve. The plant is not only an attractive ornamental shrub, but, because of its spiny branches, is suitable also for hedges. Attempts have been made to cultivate it for its fruit, and some nurserymen catalogue it, but the sale of plants is limited. Propagation is effected by seeds and cuttings. The seeds should be stratified over winter and planted in nursery rows in the spring. Two or three years are required to grow plants large enough for sale. Cuttings are made and handled like currant cuttings. Plants may be dug from native thickets, but they do not readily bear transplanting. Since the buffalo-berry is dioecious, it is necessary to set out one male plant with each four to six female plants. The male plants may be distinguished by their dense clusters of plump rounded buds, while the female plants have looser clusters of pointed buds.

The smaller thornless Canadian buffalo-berry (*S. canadensis* or *L. canadensis*), 4 ft. to 8 ft. high, with ovate leaves, silvery only on the under surface, grows on wooded banks from Newfoundland to Alaska, and southward to New York and Oregon, extending in the Rocky mountains to New Mexico. Its rounded red or yellowish currant-like fruit is insipid.

**BUFFALO-BUR** (*Solanum rostratum*), called also beaked nightshade and prickly potato, a North American annual of the nightshade family (*Solanaceae*), native to high plains east of the Rocky mountains from North Dakota to Mexico. The plant grows from 1 ft. to 2½ ft. high and in aspect strongly resembles the potato (q.v.), to which it is closely related, but is more slender,

has bright yellow flowers and is armed throughout with needle-like prickles, especially on the burrlike covering inclosing the berry. The buffalo-bur is the original host or food plant of the destructive Colorado potato beetle (q.v.) and has become sparingly naturalized eastward to Ontario and New Hampshire and also in southern California.

**BUFFALO-PITTSBURGH HIGHWAY**, a thoroughfare extending from Buffalo, New York, to Pittsburgh, Pennsylvania, about 265m. in length and paved throughout. It passes through the rich farming country of New York and the mountainous regions of Pennsylvania and takes in Collins, Salamanca, Bradford, Kane, Du Bois and Blairsville on the way.

**BUFFER**, a member which receives and absorbs the shock of an impact gently, and thus protects other parts from damage. A buffer must contain some flexible material, such as a steel spring, a rubber block, air-cushioning or a hydraulic cylinder. Buffers are employed in railway trains to protect the individual trucks and carriages, as well as the engine and tender.

**British Practice.**—Buffers are placed at the corners of the car body, and consist of circular or oval heads having long stems extending into the body, as shown by the details of a Great Western Railway steel carriage underframe designed by C. B. Collett. The volute springs surrounding the stems are 9in. diameter over the largest coil, and thrust against steel knees. A stroke of 5in.

is allowed for. An elliptical shape, 12in. by 19in., is chosen for the buffer faces in order to avoid any possibility of the buffers locking at sharp curves. Buffers for shunting engines have an extra large head. Close-coupled vehicles for suburban traffic are sometimes constructed without the two side buffers, there being a central elliptical block, and the draw-bar pulling against rubber springs. In the automatic buffer couplers the coupling end passes

DETAILED DIAGRAM OF THE TYPE OF BUFFER USED ON THE GREAT WESTERN RAILWAY IN A CARRIAGE STEEL UNDERFRAME  
The volute springs are thrust against steel knees, and the buffer faces, 12 by 19 inches. The elliptical shaped heads prohibit the buffers from locking at sharp curves. Engines employed to switch cars from one track to another have buffers with an extra large head

through a large-faced buffer, which is sometimes widened to carry two stems fitted with a compensating beam.

The fixed buffer-stop at a terminus, or at the end of a siding, may be a plain wooden beam, though it is often provided with springs. As a safeguard against the partial failure of brakes, the Ransomes and Rapier hydraulic buffer-stops are installed at many important termini. The buffer head carries a long rod that terminates in a piston working in a cylinder filled with water or oil. Passages lead out of the cylinder, permitting the fluid to escape gradually; these are larger at the front end than the back. As the speed is checked, less and less passage is provided, offering a resistance which retards the train without shock or recoil. The lengths of stroke range from 5–11ft.; the buffers in the latter case are capable of stopping a train of about 900 tons moving at 10m. an hour. (F. H.)

**American Practice.**—The buffer is used in passenger-train cars in combination with the draft gear, and consists of a steel plate carried by three horizontal stems extending into the car body just below the floor level and above the “draw-bar.” The plate comes in contact with a similar plate on the adjoining car. The stems which carry the buffer plate carry long coiled springs, the central stem in some designs also acting upon sliding friction members in combination with steel springs. A passenger car buffer serves not only to absorb the impact caused by the collision of

two cars, but to take up the slack in the couplers when cars are in a train, and to close up the gap between cars, making it safe for passengers to walk from car to car. Standard practice allows for a total stroke of 5½ inches. When cars are in a normal coupled condition, the buffers are compressed 3in., leaving 2½in. for the absorption of compressive shocks. In freight yards and sidings, a stopping device that slides along the rail is frequently employed. This depends on the friction generated between the rail and a cast-steel shoe upon which the car wheel mounts. As the shoe slides along the rail, the energy of the car is dissipated. Blocks bolted to the end of the rails finally bring the car to rest. (See also RAILWAYS.)

Spring buffers also called “bumpers” are fitted to motor-cars to protect the ends from the effects of collision. (X.)

**BUFFER ACTION.** A buffer in chemistry is any material which lessens the activity of acid or alkali, added to a solution containing that material. Buffer action may be described as the resistance offered by a solution to change of acidity or alkalinity through the addition or loss of acid or alkali. Common buffer substances include alkali salts (sodium acetate or phosphate), proteins (gelatin), the phosphates in raw sugars, carbonates in raw water, carbonates and silicates in clay, alum and rosin in paper sizing. Buffers play a very important rôle in the blood, permitting large amounts of acid to be transported and eliminated without appreciably changing the slight alkaline reaction of the blood.

The acidity or alkalinity of a solution is measured in terms of the concentration of hydrogen ions ( $H^+$ ) or hydroxyl ions ( $OH^-$ ) present. Since there is a definite relation between ( $H^+$ ) and ( $OH^-$ ) concentrations, due to their relationship in the water molecule, the acidity or alkalinity of a solution can be conveniently expressed, when the quantities are small, in terms of grams of hydrogen ion per litre, and, for the sake of convenience, as the reciprocal logarithmic exponent of this concentration, called the “pH.” For example, 0.001 gram of hydrogen ion per litre of solution may be expressed as  $1 \times 10^{-3}$  gram per litre, or simply as pH3. At pH7, hydrogen ions and hydroxyl ions are present in equal quantities and the solution is neutral. The buffer action of certain substances is made possible by the circumstance that they maintain an equilibrium between their ionized and non-ionized forms, according to the older theory of ionization; and that the ionized form has a definite pH value. As acid or alkali is added, the equilibrium shifts so that the pH is held as nearly constant as possible. Thus, although acid or alkali is added (within reasonable limits), the pH of a buffer solution will change only very slightly. Dilution changes the pH of buffer solutions only slightly; for example, sodium acetate of pH 4.615 on fivefold dilution shows a pH of 4.665. (See HYDROGEN ION CONCENTRATION; SOLUTIONS.)

See *Trans. Am. Electrochem. Soc.* (1927); W. Clark, *The Determination of Hydrogen Ions*. (A. NE.)

**BUFFET**, a piece of furniture, of French origin, closely akin to the sideboard, cupboard and dresser. It came into its greatest prominence during the Stuart period, but has varied so widely in form that it is difficult to trace its natural development. It has been more commonly used as a place to keep the necessary equipment of the dining table—dishes, china, glass and silver. The buffet, originally a small room, or recess, in which was a counter where food was served, was always provided with one or more flat spaces, or broad shelves, for the reception of dishes, etc. One type of buffet, a table with a super-structure that fits against the wall, is meant more for the display of plate than anything else. Another type, the forerunner of the sideboard of the 18th century, consisted of a heavy, low table with deep drawers beneath. The early buffets, after they became pieces of furniture, were sometimes carved with the utmost elaboration, but the Renaissance did much to refine their ornament and vary their form. The early Georgian period, however, made the buffet a subject for cabriole legs, club feet and other variations characteristic of the period. About this same time tiers of shelves, with or without a glass front, were quite often called buffets—perhaps because they were used as a place for dishes. In fact, almost any dining-room receptacle for articles that were not immediately wanted came at last to bear the name, regardless of its form.

**BUFFIER, CLAUDE** (1661-1737), French philosopher, historian, and educationalist, was born in Poland of French parents, who returned to France and settled at Rouen. He taught in the college of the Jesuits in Paris, where he spent the rest of his life. He seems to have been an admirable teacher, with a great power of lucid exposition. His principal work is the *Traité des Vérités Premières* (1717). He anticipated the spirit and methods as well as many of the results of Reid and the Scottish school. Voltaire described him as "the only Jesuit who has given a reasonable system of philosophy."

He wrote also *Éléments de Métaphysique* (1724), a "French Grammar on a new plan," and a number of historical essays. Most of his works appeared in a collected form in 1732, and an English translation of the *Traité* was published in 1780.

**BUFFLEHEAD**, the common name for a North American duck (*Charitonetta albeola*), allied to the pochard and canvas-back (*q.v.*). In colour the bufflehead is black or blackish above, white below, with a white band extending around the back of the head from eye to eye, and with the remainder of the head and the neck glossed with purple, green and blue. This small duck, about 15 in. long, is noted for its powers of quick diving. It feeds in part on small fish, which it pursues and captures beneath the surface.

**BUFFON, GEORGE LOUIS LECLERC, COMTE DE** (1707-1788), French naturalist, was born at Montbard (Côte d'Or), his father, Benjamin François Leclerc de Buffon (1683-1775), being councillor of the Burgundian parlement. He studied law at the college of Jesuits at Dijon, where he made the acquaintance of a young Englishman, Lord Kingston, and with him travelled through Italy and then went to England. He published a French translation of Stephen Hales's *Vegetable Statics* in 1735, and of Sir I. Newton's *Fluxions* in 1740. At 25 years of age he succeeded to a considerable property, inherited from his mother, and from this time onward his life was devoted to regular scientific labour. In 1739 he became keeper of the Jardin du Roi and of the royal museum. He there began to collect materials for his *Natural History*. He entrusted the descriptive and anatomical portions of the treatise to L. J. M. Daubenton, and the first three volumes made their appearance in 1749. In 1752 (not in 1743 or 1760, as sometimes stated) he married Marie Françoise de Saint-Belin, and felt deeply her death in 1769. He himself died in Paris at the age of 81 of vesical calculus, having refused to allow any operation for his relief. He left one son, George Louis Marie Leclerc Buffon, who was an officer in the French army, and who died by the guillotine, at the age of 30, on July 10, 1793 (22 Messidor, An II.).

Buffon was a member of the French Academy (his inaugural address being the celebrated *Discours sur le style*, 1753), perpetual treasurer of the Academy of Science, fellow of the Royal Society of London, and member of most of the learned societies then existing in Europe. Without being a profound original investigator, he possessed the art of expressing his ideas in a clear and generally attractive form. His chief defects as a scientific writer are that he was given to excessive and hasty generalization.

His *Histoire naturelle, générale et particulière* was the first work to present the previously isolated and apparently disconnected facts of natural history in a popular and generally intelligible form. The sensation made by its appearance in successive parts was very great, and it did good service by diffusing a taste for the study of nature. The *Histoire naturelle* passed through several editions, and was translated into various languages. The first edition is highly prized by collectors, on account of the beauty of its plates; it was published in Paris (1749-1804) in 44 quarto volumes, the publication extending over more than 50 years. In the preparation of the first 15 volumes of this edition (1749-67) Buffon was assisted by Daubenton and subsequently by P. Guéneau de Montbéliard, the abbé G. L. C. A. Bexon, and C. N. S. Sonnini de Manoncourt. The following seven volumes form a supplement to the preceding, and appeared in 1774-89, the famous *Époques de la nature* (1779) being the fifth of them. They were succeeded by nine volumes on the birds (1770-83), and these again by five volumes on minerals (1783-88). The remaining eight volumes, which complete this edition, appeared

after Buffon's death, and comprise reptiles, fishes, and cetaceans. They were executed by B. G. E. de Lacépède, and were published in successive volumes between 1788 and 1804. A second edition, begun in 1774 and completed in 1804, in 36 volumes quarto, is in most respects similar to the first, except that the anatomical descriptions are suppressed and the supplement recast.

See Humbert-Bazile, *Buffon, sa famille, etc.* (1863); M. J. P. Flourens, *Hist. des travaux et des idées de Buffon* (1844, 3rd ed. 1870); H. Nadault de Buffon, *Correspondance de Buffon* (1860); H. Lebas-teur, *Buffon* (1888); L. Dimier, *Buffon* (1919).

**BUG**, the name of two rivers of Europe. (1) A stream of European Russia, which rises in the Avratynsk hills near the Polish frontier and flows generally south-east through Podolia and Kherson, to enter, at Nikolayev, the *liman* or lagoon into which the Dnieper also discharges. Its upper part is beset with rapids and its lower has numerous sandbanks and rocky stretches which prevent navigation. (2) A tributary of the Vistula, rising in eastern Galicia east of Lwow (Lemberg) and flowing north-north-west to Brest-Litovsk, where it becomes navigable as it turns west between the provinces of Siedlce, Grodno and Lomza, to join the Vistula, 23 m. below the city of Warsaw.

**BUG**, the common name for insects of the suborder Hemiptera of the order Hemiptera (*q.v.*), also used in North America for almost any kind of insect; e.g., lady-bug (ladybird), June-bug (cockchafer). In a more restricted sense it is applied to members of the hemipterous family *Cimicidae* of which the best known examples are the bed-bugs. These are oval, flattened, mahogany-coloured insects devoid of wings and with piercing, suctorial mouth-parts. The commonest species are the cosmopolitan *Cimex lectularius*, the bed-bug of Europe and North America; and *C. rotundatus*, the bed-bug of the orient. These insects occur in dirty houses, etc., and are nocturnal, hiding by day in crevices. They are blood-sucking in habit, chiefly attacking man: pathologists have suspected them of transmitting several diseases, but further evidence is needed. Other members of the family include parasites of birds and bats.

**BUGEAUD DE LA PICONNERIE, THOMAS ROBERT**, DUKE OF ISLY (1784-1849), marshal of France, was born at Limoges on Oct. 15, 1784. He came of a noble family of Périgord, and was the youngest of his parents' 13 children. Harsh treatment led to his flight from home, and for some years about 1800 he lived in the country, engaged in agriculture, to which he was ever afterwards devoted. At the age of 20 he became a private soldier in the *Vélites* of the Imperial Guard (1804), with which he took part in the Austerlitz campaign of the following year. Early in 1806 he was given a commission and served in the Jena and Eylau campaigns. He served in Spain through the Peninsular War. At the first restoration he was made a colonel, but he rejoined Napoleon during the Hundred Days, and under his old chief Suchet distinguished himself greatly in the war in the Alps. For 15 years after the fall of Napoleon he was not re-employed. In the chamber of deputies, to which he was elected in 1831, he remained an opponent of democracy. His conduct as gaoler of the duchesse de Berry led to a duel between Bugeaud and the deputy Dulong, in which the latter was killed (1834); this affair and the incidents of another *émeute* exposed Bugeaud to ceaseless attacks in the Chamber and in the press. He was re-elected in 1834, 1837 and 1839.

About this time Bugeaud became much interested in the question of Algeria. At first he appears to have disapproved of the conquest, but his undeviating adherence to Louis Philippe brought him into agreement with the government. Sent to Africa in a subordinate capacity, he proceeded to initiate his war of flying columns. He won his first victory on July 7, 1836, made a brilliant campaign of six weeks' duration, and returned home with the rank of lieutenant-general. In the following year he signed the treaty of Tafna (June 1, 1837), with Abd-el-Kader, an act which, though justified by the military and political situation, led to a renewal of the attacks upon him in the Chamber, to the refutation of which Bugeaud devoted himself in 1839. Finally, in 1840, he was nominated governor-general of Algeria, and early in 1841 he put into force his system of flying columns. His swiftness and

energy drove back the forces of Abd-el-Kader. In 1842 he secured the French positions by undertaking the construction of roads. In 1843 Bugeaud was made marshal of France, and in this and the following year he continued his operations with unvarying success. His great victory of Isly on Aug. 14, 1844 won for him the title of duke. In 1845, however, he had to take the field again in consequence of the disaster of Sidi Brahim (Sept. 22, 1845), and up to his final retirement from Algeria (July 1846) he was almost constantly employed in the field. His resignation was due to differences with the home government on the question of the future government of the province. In 1848 the marshal was in Paris during the revolution, but his orders prevented him from acting effectually to suppress it. He was asked, but eventually refused, to be a candidate for the presidency in opposition to Louis Napoleon. His last public service was the command of the army of the Alps, formed in 1848-49 to observe events in Italy. He died in Paris on June 10, 1849.

Bugeaud's writings were numerous, including his *Oeuvres militaires*, collected by Weil (1883), many official reports on Algeria and the war there, and some works on economics and political science. See Comte d'Ideville *Le Maréchal Bugeaud* (3 vols., 1881-82, another ed. 1885).

**BUGENHAGEN, JOHANN** (1485-1558), known as the DOCTOR POMERANUS, German Protestant reformer, was born at Wollin near Stettin June 24, 1485. In 1509 he was ordained priest, and became a vicar in the collegiate *Marienkirche* at Treptow; in 1517 he was appointed lecturer on the Bible and Church Fathers at the abbey school at Belbuck. In 1521 he went to Wittenberg, where he formed a close friendship with Luther and Melancthon, and in 1522 he married. In 1528 he arranged the church affairs of Brunswick and Hamburg; in 1530 those of Lübeck and Pomerania. In 1537 he was invited to Denmark by Christian III., and remained five years there, organizing the church and schools. He passed the remainder of his life at Wittenberg. He died on April 20, 1558. Among his numerous works is a history of Pomerania, which remained unpublished till 1728. Perhaps his best book is the *Interpretatio in Librum Psalmorum* (1523). He helped Luther in his translation of the Bible and himself translated the Bible into Low German.

See Life by H. Hering (1888); Emil Görigk, *Bugenhagen und die Protestantisierung Pommerns* (1895). O. Vogt published a collection of Bugenhagen's correspondence in 1888, and a supplement in 1890.

**BUGGE, SOPHUS** (1833-1907), Norwegian philologist, the author of the first critical edition of the *Edda*, was born at Laurvik, Norway, educated at Christiania, Copenhagen and Berlin, and in 1866 became professor of comparative philology and Old Norse at Christiania University. He was a pioneer in the collection and study of Norwegian folk-songs, traditions, and Runic inscriptions. Bugge's critical edition of the elder *Edda* (*Norroen Fornkvæði*) was published at Christiania in 1867. He maintained that the songs of the *Edda* and the earlier sagas were largely founded on Christian and Latin tradition imported into Scandinavian literature by way of England. His next most important work was the monumental edition (1891 *et seq.*) of ancient Norwegian inscriptions. His writings also include *Gamle Norske Folkeviser* (1858), a collection of Old Norse folk-songs; *Bidrag til den ældste skaldedigtningens historie* (1894); *Helgedigtene i den Aeldre Edda* (1896, Eng. trans., *The Home of the Eddic Poems*, 1899); *Norsk Sagafortælling og Sagaskrivning i Island* (1901).

For a further list of his works see J. B. Halvorsen, *Norsk Forfatter-Lexikon*, vol. i. (1885).

**BUGGY**, a vehicle with either two (in England and India) or four wheels (in America). English buggies are generally hooded and for one horse. American buggies are for one horse or two, and either covered with a hood or open; among the varieties are the "Goddard" (the name of the inventor), the "box," so called from the shape of the body, the "cut under" *i.e.*, cut out for the front wheels to cramp beneath and so turn in a narrow space, the "end-spring" and "side-bar," names referring to the style of hanging. A skeleton buggy, lightly constructed, is used on the American "speedways," built and maintained for fast driving. The word may be connected with "bogie," a truck.

**BUGIS**, a semi-civilized Muslim tribe, inhabiting the south of Celebes, of Malayan stock, noted for their enterprise as pirates, traders and voyagers. They are particularly liable to the homicidal mania known as "running amok." They have formed settlements in Borneo, in the Philippines and elsewhere and do a large trade in cloth, and are famous for filigree work, for shipbuilding and for the manufacture of arms, as well as for weaving. They use a bow of Asiatic form, and hunt deer on horseback. In spite of their religion, a good deal of animistic belief survives and a shrine is reserved for the sacred objects of the tribe. Their written character resembles that of the Battak (*q.v.*) and besides translations of the Koran they possess written laws. They were converted to Islam at the beginning of the 17th century by their neighbours and kinsmen, the Mangkassaras, of similar culture, who were themselves apparently converted at some time after the arrival of the Portuguese in 1512. The princes of the Mangkassaras used each to be given a new name after death. (J. H. H.)

**BUGLE**, a treble brass wind instrument with cup-shaped mouthpiece and conical bore.

Those members of the brass wind such as the horn, bugle, trumpet and tuba, which, in their simplest form, consist of tubes without lateral openings, depend for their scale on the harmonic series obtained by overblowing, *i.e.*, by greater pressure of breath and by the increased tension of the lips, acting as reeds, across the mouthpiece. The harmonic series thus produced, which depends on the acoustic principles of the tube itself, and is absolutely uninfluenced by the manner in which the tube is bent, forms a natural subdivision in classifying these instruments:— (1) Those in which the lower harmonics from the second to the sixth or eighth are employed, such as the bugle, post-horn, the cornet-à-pistons, the trombone. (2) Those in which the higher harmonics from the third or fourth to the twelfth or sixteenth are mostly used, such as the French horn and trumpet. (3) Those which give out the fundamental tone and harmonics up to the eighth, such as the tuba and ophicleide.

Only five notes are required for the various bugle-calls, although the actual compass of the instrument consists of eight, of which the first or fundamental, however, being of poor quality, is never used.

In order to increase the compass and musical possibilities of the bugle, two methods have been adopted, the use of (1) keys and (2) valves. The application of keys to the bugle produced the Kent bugle (named after the duke of Kent, who was commander-in-chief at the time of its invention in 1810) and later the ophicleide. The application of valves produced the family of saxhorns.

The bugle, like the hunting horn, is an instrument of great antiquity. The shofar of the ancient Hebrews, used at the siege of Jericho, was a cow's horn (Josh. vi. 4, 5, 8, 13, etc.), translated in the Vulgate *buccina*, in the paraphrase of the Chaldee *buccina ex cornu*; while Gideon's use of a massed band of three hundred shofars to terrify and defeat the Midianites (Judges vii. 16) and Saul's call to arms (I Sam. xiii., 3) may also be recalled. During the middle ages

FROM "DRUMS AND FIFES"  
THE BRITISH ARMY BUGLE, WHICH, IN THE 17TH CENTURY, REPLACED THE DRUM FOR SIGNALLING

the use of the bugle-horn by knights and huntsmen, and perhaps also in naval warfare, was general in Europe.

Meyerbeer introduced the bugle in B flat in his opera *Robert le Diable* in the scene of the resurrection of the nuns, and a bugle in A in the fifth act.

**BUGTI**, a Baloch tribe of Rind (Arab) origin, numbering about 20,000, who occupy the hills to the east of the Sind-Peshin railway, between Jacobabad and Sibi, with the Marris (a cognate tribe) to the north of them.

See *Census of India*; vol. iv. (1911).

**BUHL WORK**, the process of inlaying different kinds of metal into tortoise-shell, or a composition which passes for

tortoise-shell, or sometimes wood. The metal used is generally brass or silver, both of which lend themselves to engraving. The inventor of this process was André Boulle (q.v.), but "Buhl," named after him, came to be the English spelling of this particular kind of work. Although England and America never became greatly interested in the inlaying of metal, Sheraton and a few others of the 18th century designers made occasional use of it. In the inlaying of the metal, Salisbury glue mixed with plaster of Paris is often found necessary, while the finishing calls for emery cloth, files, oil and pumice powder. See MARQUETRY.

**BUHTURĪ** [al-Walid ibn 'Ubaid Allāh] (820-897), Arabian poet, was born at Manbij (Hierapolis) in Syria, between Aleppo and the Euphrates. Like Abū Tammām, he was of the tribe of Tāi. Although long resident in Baghdad he devoted much of his poetry to the praise of Aleppo, and much of his love-poetry is dedicated to Alwa, a maiden of that city. He died at Manbij (Hierapolis) in 897. His poetry was collected and edited twice in the 10th century. It was published in Constantinople (in 1883). Like Abū Tammām he made a collection of early poems, known as the *Hamāsa* (index of the poems contained in it, in the *Journal of the German Oriental Society*, vol. xlvii, pp. 418 ff., cf. vol. xlv., pp. 470 ff.).

Biography in M'G. de Slane's translation of Ibn Khallikān's *Biographical Dictionary* (Paris and London, 1842), vol. iii. pp. 657 ff.; and in the *Book of Songs* (see BAR-HEBRAEUS), vol. xviii. pp. 167-175.

**BUILDERS' RITES.** The view that the custom of placing within a cavity beneath a foundation stone a few coins of the realm, newspapers, etc., ensured that particulars might be found of the event on the removal of the stone hereafter, may suffice as respects latter-day motives. But such memorials are deposited in the hope that they will never be disturbed, and originally it appears that living victims were selected as "a sacrifice to the gods," and especially to ensure the stability of the building. There is no lack of evidence as to this gruesome practice, both in savage and civilized communities. In the 15th century, the wall of Holsworthy church was built over a living human being, and when this became unlawful, images of living beings were substituted (*Folk-Lore Journal*, i. 23-24).

See G. W. Speth, *Builders' Rites and Ceremonies* (1893). See also *Religion of the Semites* (3rd ed., 1927).

**BUILDING.** A building is that which is built; and the term is also used to cover the practical activities necessary for the erection and maintenance of structures, built where they are to stand, for the shelter or use of human beings.

**Developments in Building up to Recent Times.**—The genesis of constructional forms adopted in modern building must be sought in the solution of building problems in the past. Forms of early construction have been modified as technical knowledge and trade skill have increased. To understand the origin and significance of these changes requires a brief survey of the development of building from mediaeval times.

To judge by the existing buildings of that period, both the technical skill of the trades and their co-ordinated efforts in the production of great buildings reached a very high level.

Among the chief factors favourable to the development of a high measure of craft skill at that period were the extremely slow development of constructional methods and the rare introduction of revolutionary changes. The resulting stability of conditions allowed a simple system of apprenticeship to develop into an instrument of education and craft training, which was of a high order in relation to the needs of the period, and helped to raise the status of the craftsman. Again, the craft guilds had monopolist powers, an essential factor in their constitution, and one that counted for efficiency in the training of apprentices and the suppression of bad workmanship.

In spite of the controlling power of the guilds the traditional systems of training and construction did not long survive the introduction of new methods which accompanied the "foreign" styles of the Renaissance. The reactions due to these changes varied in the several European countries, but they resulted generally in the introduction of the professional designer; gradually the native craftsman was displaced and his skill declined.

Profound changes in building processes followed the invention of Portland cement by Aspdin in 1825, and the subsequent inventions of Bessemer and Siemens which helped to reduce the cost and increase the production of mild steel. The 19th century was one of great industrial expansion and constructional activity, and witnessed a steady extension of the uses of cement and steel. This extension was greatly assisted by an increased knowledge of scientific principles as applied to construction. Steel-framed buildings, reinforced concrete structures, and the increasing use of machinery both in the work-shops and during the erection of buildings are striking results of these changes. It is certain that improved methods of design, with more accurate assessment and computation of the strength and permanence of building materials, will have far-reaching results upon all branches of building in the future.

**The Initiation of Building Work.**—The production of buildings in civilized countries to-day is generally the result of co-operation between four parties, viz., the building owner or client, the architect or professional adviser to the client (including all concerned with planning and designing), the builder (including all concerned with the actual erection of the building and the preparation of its parts), and the community, which is concerned with the public safety, the hygienic conditions and the effect of building on the amenities of a neighbourhood, always an important consideration.

Owners may range from the private individual requiring a dwelling to the large industrial, civic or national body initiating some great undertaking.

The architect may be assisted in his approach to the problem of his client by the intimate general knowledge of the requirements which his client may be expected to possess and which may, in the case of large corporate bodies, be based upon long experience of the use of buildings for a similar purpose. The architect will, however, be expected to possess special knowledge of a more particular and technical character, which may be the result of long experience in particular classes of work; e.g., works and offices for special trades and industries, banks, hotels, churches, schools, hospitals, theatres and cinemas. In the case of the larger firms of architects, the special knowledge required may be confined to one partner or responsible assistant. In America, where commercial schemes are often of abnormal size, architects and allied professional men, having varying specialized knowledge, work together in groups. The special advice they are able to offer frequently includes an estimate of the financial prospects of a scheme and determines the nature of the plan and the type of construction to be utilized. Programmes formulated under such circumstances may make unusual demands upon the building industry, but impracticable schemes are guarded against by the fact that the architect is responsible for the supply of detailed information to the builder and for the general direction of procedure.

Assuming that the architect has reached the position where the actual design of the building may proceed, general plans, elevations and sections are prepared for the consideration of the owner, alternative schemes being sometimes considered. When approved by the client these drawings are elaborated to explain the proposals to the local authority and to the contractors who will later be invited to compete for the execution of the work. During the preparation of a scheme the architect must give due consideration to local building by-laws, which call for the recognition of a building line, the provision of adequate light, open spaces of a minimum area, proper foundations, thicknesses of walls appropriate to their height and purpose, damp-resisting provisions, and sizes of timbers in floors and roofs. For massive buildings and those of great height, difficulties may arise in regard to foundations, involving preliminary investigations on the site to determine the nature and resistance of the natural foundation. Occasions arise in extensive and exceptional schemes where the architect requires expert assistance of a particular kind. He may then recommend the owner to employ a professional consultant to prepare or advise upon a detailed scheme for a particular branch of work. Alternatively, if a patent method of construction is proposed or a spe-

cial production of a particular firm is to be employed, such firms are usually willing to submit a scheme in the hope of being employed to execute the work or to supply the material. Specialists of this type undertake such work as structural steelwork, reinforced-concrete work, patent floors, heating, ventilating, lighting, lifts, rolling shutters, patent glazing and equipment for specific purposes. In this respect architectural practice in Great Britain differs somewhat from that followed in America, where the larger offices often have sufficient specialists to prepare preliminary designs for a large and complete building. These arrangements are intended to secure co-ordination and economy of effort.

When a scheme is completely arranged, steps are taken to ensure its realization. In important work a *specification* is provided; i.e., a document prepared by the architect, describing in detail the material and its preparation and the methods of construction to be employed in the building. At least two copies are provided, one being retained by the architect and the other used by the builder. It is appropriate at this or an earlier stage to obtain an approximate estimate of cost for the consideration of the client, the usual method being to *cube* the building and to apply a unit cost obtained from an analysis of actual costs of comparable buildings. For example, in the case of churches, schools and entertainment buildings a unit price per seat is applied, and in the case of hospitals a unit price per bed.

In much modern practice a separate specification is not employed, but an abbreviated description of the work allotted to each trade is provided in the *bill of quantities*. This is prepared by a *quantity surveyor*, the architect himself occasionally acting in this capacity. Quantities are obtained by measurement from the plans already prepared and with the assistance of the full or abbreviated specification. The bill is so arranged that by pricing the items the builder may readily arrive at a total estimate for the proposed work. The provision of a detailed bill of quantities is usual in Great Britain, and has the advantage of defining with some exactness the amount of work intended to be done and the price for which each item will be executed. These details facilitate the settlement of accounts at a later stage, especially where variations from the original intentions have been made either by the architect or his client, or at the instance of the builder with the approval of the architect. The preparation of the bill occupies considerable time, and where work is being hurried forward or the competition is limited to a few building contractors, formal quantities are often omitted and the estimates prepared by reference to well detailed general drawings. This is largely done in America, where plans are specially elaborated for the purpose at an early stage.

The position has now been reached where the architect is ready for inviting "tenders," or offers to execute the work at a stated price. This may be done either by advertising in the local press and in reputable trade journals, or by inviting tenders from a limited number of selected contractors of whose work and reputation the architect has some previous knowledge. Unless there is some special reason to the contrary, a contract is usually entered into with the firm submitting the lowest tender, after which construction may be begun.

#### BUILDING ADMINISTRATION

**The Builder.**—The builder is the person chiefly concerned in the submission of a tender for the erection of a building. The term *builder*, though in common use, has not a very exact connotation, and in this it differs from the term *architect*, which may be strictly defined in the professional sense. Industrially the term is considered applicable to a person (or firm) employing labour from more than one of the building trades. The size of such a business may range from the very small firm occupied mainly in the repair of small buildings, to the large firm undertaking substantial contracts at widely separated centres.

A builder who initiates building projects on his own behalf is known as a "speculative builder," but the term cannot logically be applied exclusively to the erector of small and cheap property. The speculative builder with knowledge and vision may do and has done good service, as is proved by the well-known work of the

Adam brothers at the Adelphi, of Grainger and Dobson at Newcastle-on-Tyne, and of Allen and Wood at Bath. These works were "speculative" in the sense defined above.

A builder whose establishment and command of capital enable him to accept ordinary building contracts is usually called a *building contractor*. If, in addition, he undertakes comprehensive work such as road-making, drainage schemes, waterworks and storage reservoirs, he is called a *public-works contractor*. All the above descriptive terms apply to businesses having similar working organizations, and differing in scale or degree rather than in kind.

**The Preparation of the Estimate.**—Before the actual execution of building contracts, the preparation of a tender or estimate of the builder's price for the proposed work is a vital operation. The problems involved cannot be detailed here; they require much knowledge and experience, and their solution imposes a severe test upon the organization of the business. An experienced builder readily determines ordinary item prices in simple ways, but in large organizations estimating is done by delegation to several persons. The former method of estimating would be impossible and fundamentally wrong for large contracts. Delegation requires system, and the system must permit the two fundamental operations of costing and estimating or pricing to be properly done. Costing is the operation of ascertaining the actual cost to the builder of an individual piece of work. The process may consist of totalling the expenses incurred in the execution of a whole contract in order to compute the total profit or loss on the work; or it may be a detailed analysis of cost, under known conditions, of many smaller operations. In modern practice the latter form of costing is sometimes called production costing, in which by careful and immediate analysis of actual cost, waste may possibly be prevented and the cost made to fit the price. It is only on the second system of costing that reliable item prices may be determined for use in pricing bills of quantities. Special factors which affect costs and require careful consideration when preparing tenders are the nature and accessibility of the site, the freedom for delivery and storage of materials, the supply of labour and of water and power, the time allowed for completion of the contract, and the disposal of surplus material from the site. The time limit is a vital matter (especially where a builder has undertaken several contracts) and serious difficulties often arise in organizing an adequate supply of materials and specialities in the order required and in time to avoid delay.

The time element is, to the estimator, an important factor in many cases. Business premises and places of entertainment in big cities may be projected on very expensive sites; there are high capital charges which, with the absence of revenue during erection, may justify exceptional methods of procedure to hasten completion of the structure. Such methods may involve greater but justifiable expense to the builder and would result in a higher tender for the work. In America the question of rapid construction has been investigated for economic reasons, and special methods have been adopted to shorten the period of erection. These include the use of time schedules or charts which schedule the time allotted for the completion of each important subdivision of the work. The dates for the ordering and delivery of building material and of fabricated work are thus clearly indicated. It is usual, in American practice, for the contracting firms, when tendering, to submit a time schedule to indicate their proposals for the progress of the scheme within the time limit. In British practice at present, a schedule, if used, is prepared after consultation between the interested parties subsequent to the signing of the contract.

**The Contract.**—After the decision of the owner, with the advice of the architect, to accept a particular tender, the acceptance should be made legal by the execution of a formal contract between the owner and the contractor. Many legal issues may arise even in the smallest contracts, and it is of importance that the form of contract should be drawn up with care and its provisions based upon the best legal advice. To combine economy with safety and to take advantage of common experience in the building industry, it is now usual to adopt an agreed form of contract which

has been approved by the associations and federations representing architects, contractors and sub-contractors. Such forms of contract were adopted in Great Britain, and in America, after joint discussions between architects and contractors.

The contract documents usually state the price which the owner undertakes to pay, and the contractor to accept, upon satisfactory completion of the work being certified by the architect. The architect undertakes to supply certain drawings and details, a specification and copies of the bill of quantities; he further undertakes to supervise the work. Other important contract conditions provide for the periodic payment of the contractor as the work proceeds on the issue of certificates by the architect, the amount of the payment being usually limited to an agreed percentage of the value of work so certified. The date of completion is embodied in the contract, which also provides for proportionate penalties and bonuses payable or receivable for overrunning or keeping within the time limit. A clause is also inserted defining the arrangements for arbitration upon disputes which may arise between the architect and the contractor.

The previous paragraphs have dealt with the procedure of letting a contract by a fixed sum tender. For some kinds of work, particularly in the repair of large and old buildings, where the nature of the proposed work is known, but not the quantity, two other forms of tender are recognized. In the first, known as the priced schedule, the contractor tenders an estimate containing prices for each item of work of a specified kind. On completion the items of work are measured and the total liability ascertained. An accurate forecast of the cost cannot be expected on this basis. The second method of tender is termed actual cost plus profit, by which the contractor undertakes to charge only the actual cost of executing the work, together with a fixed profit, the rate of which is embodied in the contract.

**Relation of the Architect to the Contractor.**—Prior to the signing of a contract, the architect acts as the professional adviser to the owner, but when the contract has been signed, the relations necessarily change. The architect is, by custom, the person responsible for interpreting the conditions of the contract and of deciding the manner in which these conditions shall be complied with. It is generally held that, in spite of the fact that he is paid by the owner, the architect should act impartially towards both parties, thus ensuring a faithful observance of the contract.

**Sub-letting.**—The range of constructional trades is now so extensive that most building contractors confine their direct activities to a few trades. Sub-letting of portions of contracts is thus a common practice. The employment of certain specialist sub-contractors may be dependent upon the architect's selection of certain methods of construction. The contract figures, or approximate values, for these sub-contractors' work are usually included in the bill of quantities under the heading of provisional sums. The employment of other sub-contractors by the builder is usually subject to the approval of the architect. The general contractor not only assumes legal responsibilities under a contract, but may be held responsible for the general progress of the work, which requires co-ordination of the functions of sub-contractors; he should therefore provide by separate agreements for the observance of the general conditions of the main contract.

**The Building Contractor in the United States.**—In the United States of America much more emphasis is laid upon organization for production than in Great Britain, and consequently there has developed a professional type of building contractor, who may or may not possess works, but will undertake the responsibility for a complete contract and possibly sublet the whole of the work to sub-contractors. The reputation of such a contractor will depend upon successful completion of contracts within predetermined limits of time and cost; the system tends to focus attention on methods, processes and business organization for expediting the erection of the building. Remarkable results have already been achieved by reducing the period of time required for the completion of large buildings. Whatever the means adopted, the duties of the general contractor are so important that special attention should be given in the future to his selection and training.

On important contracts the architect is represented by a clerk of works, whose duties are to ensure that the material used and the methods of construction employed are in accordance with the terms of the contract. The clerk of works is paid directly by the owner.

**Local Building Regulations.**—The plans of a building must be approved by the local authority in whose area the building is to be erected. The same authority will exercise control during erection, and to some extent will be responsible for certifying satisfactory completion. It is important that the contractor should be reasonably acquainted with the local regulations controlling building work. These are incorporated in building by-laws, which range from the relatively simple by-laws of small towns to the complex regulations made under the various Building and Health acts of London. Supervision for a local authority is conducted by building inspectors, and for London by district surveyors acting under the superintending architect. The duties of the latter officers are specified and regulated by clauses of the Building acts.

There are regulations affecting the prosecution of building work on a town site such as those concerning the provision and use of hoardings and scaffolding, the demolition of old buildings, the necessity for shoring and gantries, and the use of cranes and machinery. The builder must comply with these.

Various details of materials and construction are dealt with under separate headings. (*See* BRICK; BRICKWORK; CEMENT; CONCRETE; FIRE PREVENTION; FOUNDATIONS; MASONRY; PLASTERING; ROOFS; SCAFFOLD; SHORING; STEEL CONSTRUCTION; STONE; TIMBER; WALL-COVERINGS, etc.)

## THE BUILDING INDUSTRY

In spite of the fact that, until comparatively recent times, the various building trades were only very loosely bound together, the relations between them being relatively casual and more a matter of tradition than of definite organization, it has never been a very difficult matter to assess the dimensions of these occupations, since they were by tradition largely compacted in several well-defined and readily understood trade groups. In modern times there has been a steady extension of the number of occupations having some connection with building work, many of them being engaged in the manufacture of fittings, equipment and materials of a kind not previously used, or only used to a slight extent in such work. It has thus become extremely difficult for statistical purposes to set exact occupational and industrial limits to this industry.

The term building industry, however, may be correctly used to include all those occupations, industrial and professional, which are entirely or mainly occupied in building work, excluding those which are concerned only in part in supplying some product used in building, *e.g.*, the production of cast-iron goods and ironmongery. The main trades usually included in it as well as the number of persons occupied may be judged from the following list of insured persons engaged in the building trades in England and Wales in July 1927. Carpenters, 134,450; bricklayers, 75,760; masons, 24,560; slaters, 6,130; plasterers, 22,130; painters, 114,610; plumbers, 34,220; labourers to the above 265,020; all other occupations, 170,980; total, 847,860.

Owing to the widespread demand for the services of the building industry, the occupations comprised therein are distributed with remarkable uniformity over the whole country; hence the industry is not subject to those striking concentrations which may be observed in other industries.

**Training of Personnel.**—The problem of most obvious import both to this industry as a whole and to each of the separate trades involved in it is the training and selection of personnel. Pronouncements on these problems were made in Great Britain by the National Industrial Council and also by the National House Building Committee at a later date (1924), dealing, however, chiefly with the question of the selection and training of apprentices. These and similar discussions have resulted in a clearer understanding of the nature of these problems and of the relative merits of various solutions which have been propounded. The most stable scheme so far established is probably that ini-

tiated in connection with the painting and decorating trade. This is organized by a national joint education committee and aims at the encouragement of a better standard of craftsmanship by means of competitions, the improvement of craft education, and the establishment of properly considered apprenticeship conditions. Other national schemes of apprenticeship have been set in motion in the plumbing trade, in the plastering trade, and in the heating and ventilating trade. Local apprenticeship schemes have been established in a number of centres, all involving co-operation with the education authorities in the provision of suitable technical education.

The steady growth in the size of individual building firms, which has accompanied the initiation of large-scale building projects and has been the result of a desire to benefit by the economy of large-scale business methods, has created a demand for a higher type of employee who shall be capable of dealing with the larger problems of organization and control in large contracting businesses. Increasing attention is being given to this problem by technical institutions. The Institute of Builders, which has been reorganized so as to be able to deal with all matters affecting the general improvement of the building industry as a whole, has considered, among other proposals, the establishment of degree courses in building at one or more of the universities. Such courses would deal with those larger problems arising in connection with the work of the industry, and would help to raise the general level of technical knowledge and ability in the industry. Similar efforts are being made in other countries.

In New York joint boards have recently been established which include in their constitution all parties likely to be interested in the methods of improving building practice, such as architects, owners, employers and employees in the building trades, and the local authority. These bodies deal with apprenticeship, craftsmanship, safety, co-operation between the trades, and the regulation of seasonal demands for building work. The work of the Federal Board for Vocational Education may also be referred to in this connection. (F. E. D.; J. L. M.)

**BUILDING SOCIETIES.** The name "Building Society," once entirely descriptive, has become almost a misnomer as the functions undertaken by these societies have developed and become modified. A few unincorporated societies may still build houses, finance building operations, or acquire property, but the great incorporated societies do not any longer undertake these tasks. The title fails to describe their actual purpose, and the most authoritative textbook describes the building society as "a combination of investors and borrowers operating under a measure of government control to promote the ideals of thrift and home-ownership. The investors—who are either member-shareholders or merely depositors—supply the funds from which house-purchase loans are made. The difference between the rate of interest received from the borrower and that paid to the investor represents the margin which enables a society to meet its management expenses—a very modest figure in most cases—as well as to build up and maintain adequate reserves."

The society derives its funds from depositors and shareholders. It has financial relations with three classes of people, viz., savers of small weekly and monthly sums, depositors and shareholders with more substantial interest, and its borrowers. To a limited degree it is like a bank, but its lending powers are much more circumscribed. Loans are made for (1) the purchase of existing premises, (2) assistance in having houses built or extended, and (3) paying off existing mortgages.

In the large societies there is a difference of approximately 1% between the rate of interest paid and that received, and this forms a sufficient margin for administrative expenses. Development in the movement during the early part of the 20th century was so rapid as almost completely to change its character, and this fact has, in many cases, outdistanced the popular conception, which still tends to regard the movement in the light of the characteristics it exhibited late in the 19th century. For example, the earliest societies were all terminating societies, consisting of a limited number of members and ceasing to exist when all had participated according to their agreements. Some of these still exist, but by the building society movement is understood now the permanent societies which are overwhelmingly important. In these there is no legal limit to the number of shares or to the general expansion. Speaking generally, terminating societies are of historical interest only.

**History of Development.**—It was long supposed, and indeed indicated in earlier editions of this Encyclopædia, that 1795 in Birmingham was the starting point, but the researches of Mr. Harold Bellman have revealed the fact that a society was established in Birmingham in 1781 on a large scale.

"Dec. 3, 1781—Proposals for establishing a Society for Building on Lands belonging to William Jennings, Esq., to continue certain streets in the Hamlet of Deritend, called Bradford Street, Alcester Street, Lombard Street, Moseley Street, Birchall Street, and Cheapside; and open certain new Streets, to be called River Street and Long Bridge Street."

(The full conditions are set out by Langford in his *Century of Birmingham Life*, vol. i. p. 201.)

Other authorities have suggested the origin at Kirkcudbright in 1809. The movement originated about the same time as friendly and co-operative societies, and building societies were first certified under the Friendly Societies act of 1834. Their rapid rise led in 1836 to a special act which extended the friendly society regulation to them, binding all members of a society by the rules which were certified by especially appointed officers who gave security. Provision was made for control by a committee of management. The society's property was vested in trustees empowered to bring and defend actions and to settle disputes by arbitration. Exemptions were given from stamp duty and usury laws. By 1850 over 2,000 societies were registered in the United Kingdom, many of them marked by glaring defects in their financial arrangements.

About 1846 the idea of permanence was first developed in practice, because it was recognized that there were many non-borrowing members who were really investors and it was of no significance at what point they began to invest. In 1871 a Royal Commission enquired into and reported on their working, and in 1874 a consequential act was passed that was the foundation of present practice. Under this act the liability of members was limited to the arrears due from them for the amount owing under mortgage. New societies could no longer be formed unincorporated, and in 1925 only 39 of the unincorporated societies survived, while there were 1,088 incorporated societies.

One effect of incorporation was that members and all who derive title through them were relieved from having to trace that title through the successive trustees of a society. Power to borrow money was also expressly given to the societies by the act, but upon two conditions: that the limitation of liability must be made known to the lender, by being printed on the acknowledgment for the loan, and that the borrowed money must not exceed two-thirds of the amount secured by mortgage from the members, or, in a terminating society, one year's income from subscriptions. Previous to the passing of the act (or rather to the judicial decision in *Laing v. Read*, which the clause of the Act made statutory) there had been, on the one hand, grave doubts on high legal authority whether a society could borrow money at all; while, on the other hand, many societies in order to raise funds carried on the business of deposit banks to an extent far exceeding the amounts used by them for their legitimate purpose of investment on mortgage. The act stipulated that if a society borrowed more than the statute authorized, the director accepting the loan should be personally responsible for the excess.

The Starr-Bowkett societies which at one time were regarded as typical of the movement (over 1,000 being established) are no longer considered typical. They existed to provide advances to members, free of interest, and in practice advances were made to borrowers without specified interest. Upon the accumulation of a special sum it was balloted to one of the members, who repaid it by instalments over an agreed period. The successful member often had the right to sell at a profit, but this gave rise to many difficulties and was later modified.

Various undesirable practices, and the failure of the famous "Liberator" in Oct. 1892, led to further legislation which was designed to secure the position of the large majority of societies, that were soundly administered, and to prevent their reputations being tarnished by the few which were less carefully conducted. The act of 1894 required all incorporated societies to make a return on a prescribed form of:

- (1) Individual mortgages in excess of £5,000.
- (2) Properties which had been in the possession of a society for more than 12 months through default on the part of the mortgagors.
- (3) Mortgages more than 12 months in arrear.

Since this act public confidence has been steadily restored, disturbed only by the failure of the Birkbeck Bank in 1911. In the case of the "Liberator" failure in 1892, it ought to be clearly recognized that it had long ceased to perform normal building society functions. In the hands of Jabez Spencer Balfour its funds were applied without scruple to all kinds of speculative enterprises. The frauds excited public indignation and disgust, and the widespread distress was met by a public relief fund to which £114,000 was subscribed.

The Birkbeck failure was a clear illustration of the necessity for adhering strictly to the rules of the movement and for non-indulgence in banking business. In this case the total mortgaged assets were only three-quarters of a million, whereas the other assets accounted for 11½ millions. It was not an incorporated society; it was not worked under the building societies acts, or subject to their regulations. Its difficulties arose not from its building society business, but from its bank business. The official receiver reported that the failure was due to shrinkage of securities and lack of banking experience.

The capital of incorporated societies fell from 54 millions in 1887 to 43½ millions in 1895. The recovery began in 1898, and since the setback in 1911 there has been a steady forward march to the end of the World War, with a subsequent development of remarkable proportions.

**Control and Administration.**—The chief registrar of friendly societies prescribes the form of annual accounts for each society from which he compiles his abstract and report for parliament. The rules of a society, as approved by him, can be amended only subject to his approval, and he exercises a general supervision to see that the societies are acting within their powers.

A society's annual statement has to show particularly the number of mortgages and the amounts outstanding thereon, classified up to £500, then £500 to £1,000, from £1,000 to £3,000, and from £3,000 to £5,000. Details have to be given of repayments 12 months in arrear, or property in possession, and mortgages in excess of £5,000. The form of account is by no means ideal, but it is the result of compromise and historical evolution.

Very exacting rules are laid down for the auditors. On the investment side building societies are practically confined to trustee securities.

The ultimate authority of a society rests in its general meeting, which elects directors and auditors, and one of the latter must be a public accountant. It is a common practice for the directors to have an audit of their own.

**Arrangements for Investment.**—It is usually claimed that investment in a well-run society is free from risk of depreciation, with a good yield of interest and easy realization. The securities, apart from gilt-edged securities, are carefully selected in individually investigated mortgages. First of all, there is an *ad hoc* specific valuation, with a definite margin between this and the advance, and then the advance is steadily and rapidly reduced so

that, by the monthly or quarterly repayments, the margin of safety on each mortgage is rapidly increased. Moreover, the personal covenant of a borrower of reputable stands behind. Deposit or loans to a society are limited to two-thirds of the mortgaged assets and are not based upon securities. Shares are held either as fully paid or partly paid, the latter being specially suitable for small saving by instalments. The rate generally paid in the south of England on share capital is 4½ or 5% free of tax, but 4 to 4½% is common in the north.

There are no expenses to the investors for brokerage, commission, or stamp duty, and fines for non-payments of subscriptions on partly paid shares are leniently administered. Special arrangements have been entered into with the Inland Revenue department, whereby the society pays income tax direct on a conventional fraction of the share deposit interest, the basis of which is an assumption that half the recipients are exempt and half have incomes liable on the lower ranges of tax. A part of the arrangement generally adopted is that the payer of mortgage interest to the society is not under the ordinary obligation of a borrower to deduct tax from the interest and account for it by direct payment to the Revenue. It will be noted, of course, that investment by way of deposit or share capital is in no way limited to people interested as borrowers. The borrower is usually required to find the minimum amount of 20% of the society's valuation of the property. Short lease property, with its depreciation of value and risk of dilapidation claims, is rarely made the subject of mortgage. A borrower can obtain a higher advance if he deposits further collateral security, concerning which, however, practice and rules are rather complicated. At other times guarantees are given through insurance offices, but this practice is not of rapid growth. The borrower sends his survey fee and a small entrance fee in advance, and then upon final acceptance, on examination of the title, legal fees become payable. Advances are usually repayable by fixed monthly instalments of principal and interest spread over varying periods, and the borrowing member may choose any term from five to 15 years, or even more, in discharging his liability. This system, which frees the borrower from the trouble of making monthly calculations of the amount due, also permits of a larger proportion being lent than by any other method, as the amount of the advance is being gradually reduced throughout the whole period for which it is granted.

Every encouragement is given to the borrower to pay off sums in addition to his monthly liability. On such extra repayments of principal interest ceases to be charged, and the sums may be employed to reduce either the total of the monthly payment or the term of repayment. Favourable circumstances sometimes enable the mortgagor to repay the whole of the balance, and this is usually permitted, with the provision either that a specified (and usually short) notice is given, or that interest for the same period is paid in lieu of notice (H. Bellman, *Building Society Movement*, p. 45).

No borrower is actually tied to the mortgaged property during the whole term of repayment, for he can arrange a sale and clear up the outstanding balance. On the other hand, he is under no risk of a mortgage being called in, and there are, therefore, important differences between his position and that of an ordinary mortgagor. In practice great care is taken in the admission of borrowers.

Of late years a special insurance arrangement has been entered into with many societies whereby, for a single premium, the whole of the outstanding balance in the event of the payer's death is remitted, thus avoiding any difficulty to the dependents in keeping up payments. Some 150 societies have now adopted this scheme.

**Economic and Social Position of the Movement.**—Since the World War the movement has entered upon an altogether new stage. The special conditions attaching to the building industry for several years prior to the war, the abnormal circumstances of the five years' war period, the natural incidence of the increase of population arriving at the adult stage—all combined to make a house shortage of extraordinary stringency. Even

outside the actual wage-earning classes those who needed houses were great in number and insistent in demand. Those who had professionally supplied them on hire would no longer do so. Each would-be occupier had to supply his own demand and become also an owner. In the vast majority of cases he was not himself possessed of the necessary circulating capital. The demands for the available supplies of capital in other directions were enormous. In the absence of the building society movement it is probable that in response to such pressure a large number of institutions would have sprung up to supply the need. They would have varied enormously in their resources and their regulations, in their probity and their wisdom and foresight. New and hastily improvised structures would have been suddenly subjected to a vast and rushing flood of insistent requirements. It is fairly clear that out of such a situation must have come many failures, disappointments, and losses. But, as it was, the onrush was actually made upon a system of accredited institutions with traditional practice laid down on sound lines and with all the prestige of solid and steady progress, standing ready for their task. They had won the right to be trusted with this larger task, and they took the whole of the weight of it from the community without abating anything of their practised caution, but revelling, rather, in the new opportunity of adapting their elastic organization to every reasonable fluctuation of human and communal need.

**Movement in the Dominions.**—On the whole the British model prevails and the act of 1874 is in many places adopted almost in its entirety. In New South Wales the movement began about 1846 and the terminating has been much more popular than the permanent system. Many former defects in the administration and constitution were put right in 1923 and it is thought that these long overdue improvements will re-establish public confidence. In Western Australia the first society was established in 1862. Queensland, South Australia, and Victoria have movements on British lines calling for little comment. In Canada the loan companies are wholly the offspring of the co-operative building societies of pre-confederation days, the first one recorded being in Montreal in 1845. In contrast to building societies in England these loan and trust companies have shewn a tendency to amalgamation. In 1900 legislation was passed, providing for shares to be fixed, permanent and non-withdrawable, and this was effective in eliminating weakness, for, by the end of 1924 there were large increases in total resources. These companies have contributed enormously to the development of every province in the dominion.

In India the conditions are so different that these institutions hardly come within our definition.

In New Zealand there are 41 permanent and 45 terminating societies, with £3,000,000 and £1,500,000 advances respectively. In 1920 power was given to the governor-general to approve a society for the investment of trust funds, but in 1924 this privilege ceased, not because of dissatisfaction where it had applied, but because of the invidious distinction which it seemed to make in cases of approval or non-approval.

In South Africa the Natal Building Society was the first permanent society, established in 1882. Societies are not yet under government supervision or control, but in spite of this grave defect it is estimated that their combined assets are not less than £16,000,000.

**United States.**—Terminology presents some difficulties, for the State laws vary as to titles. There are "co-operative banks," "building associations," "savings and loan associations," "home-stead associations," "mutual loan associations," and many other names built upon combinations of these, and with special additions such as "people's" and "citizens'." There are 12,800 societies for thrift and home ownership. They began with the Oxford Provident Building Association in Philadelphia in 1831, and in the early days in their constitution and purpose were similar to the English societies.

In New Jersey the first step was taken in 1847, in New York in 1851, in Chicago in 1849. In the period 1850-60 the movement made some progress, but the first period of unusual growth

was from 1880-97, when the assets reached 600 million dollars. From that date to 1904 there was little progress, but from 1904-13 they doubled their resources and from 1920-26 increased by 150%. There is no distinctive American type, for each state has its own laws and regulations. The terminating society has almost disappeared, but the serial type is very common. In the serial associations stock is issued in series at stated intervals—annually, half-yearly, or quarterly. When a series has matured, each non-borrowing member receives the face value of his stock in cash, and those who have received loans apply the maturity value to the liquidation of their debt and the mortgages given are cancelled; the series being issued regularly, the associations become perpetual.

Another type is known as the "permanent association" which is much more on British lines. In the West, guaranty stock associations are popular. Certain fixed, permanent and non-withdrawable capital stock is paid in full at the time of issue, with an agreement that it is to remain as permanent guarantee capital, which shall protect and guarantee all other stockholders and creditors against any loss, besides guaranteeing the fulfilment of all contracts with saving or borrowing members. When once paid for, the stock must be kept unimpaired. These associations also issue regular running stock, and paid-up stock, or fully paid and instalment investment certificates. In all cases, the funds are invested in amortized loans on real estate security. The repayment is periodical by dues on shares in addition to interest on the loan, averaging from 6 to 8% according to the district.

The Congress has recognized the peculiar social character of the institutions by exempting them from the operation of income tax, and giving also to the individual member an exemption of 300 dollars from income from investment in the associations. H. Bellman testifies to the very important work of these institutions in the United States.

**European Conditions.**—On the Continent both British and American types are almost unknown. There are many institutions connected with house-purchase, but they are almost entirely State-aided or run by municipalities, Spain being practically the only exception.

See H. Bellman, *The Building Society Movement*, with an introduction by Sir Josiah Stamp (1927); *The Silent Revolution* (1928). (J. S.)

GREAT BRITAIN  
BUILDING SOCIETY TOTALS FOR 1926

|   | Incorporated and unincorporated societies. |        |               | Unincorporated societies only. |
|---|--|--------|---------------|--------------------------------|
|   | England.                                   | Wales. | Scotland.     | Great Britain.                 |

| Over £5,000 . . . . .                                   | 7,113                                      | 35     | 53            | 106                            |
| Properties over 12 months in possession . . . . .       | 108  | 11     | 39            | 3                              |
| Mortgages over 12 months in arrear . . . . .            | 144  | 27     | 19            | ?                              |
| Total assets . . . . .                                  | 189,044                                    | 2,568  | 2,244         | 4,127                          |

The following statement shows the first seven societies in the United Kingdom (1926):—

| Name.                        | Members. | Annual advances. | Total assets. |
|------------------------------|----------|------------------|---------------|
|                              |          | £                | £             |
| Halifax Permanent . . . .    | 154,825  | 8,452,562        | 27,663,946    |
| Halifax Equitable . . . .    | 40,752   | 4,505,928        | 11,255,039    |
| Abbey Road . . . . .         | 44,455   | 2,053,657        | 5,171,810     |
| Leeds Permanent . . . . .    | 39,403   | 1,760,589        | 7,242,898     |
| Leicester Permanent . . . .  | 32,820   | 1,336,125        | 5,038,318     |
| Bradford Third Equit . . . . | 30,425   | 1,495,231        | 8,800,300     |
| Huddersfield . . . . .       | 29,961   | 1,681,923        | 6,756,699     |

SUMMARIES 1890-1926  
(England and Wales and Scotland.)

| Year.          | Number of societies. | Number of members. | Mortgage assets. | Total assets. |
|----------------|----------------------|--------------------|------------------|---------------|
|                |                      |                    | £ (000)          | £ (000)       |
| 1890 . . . . . | 2,378                | 615,025            | 47,761           | 51,495        |
| 1900 . . . . . | 2,238                | 584,051            | 45,642           | 59,767        |
| 1910 . . . . . | 1,690                | 626,366            | 59,696           | 76,287        |
| 1915 . . . . . | 1,454                | 626,174            | 59,890           | 64,755        |
| 1916 . . . . . | 1,408                | 626,366            | 57,099           | 65,170        |
| 1917 . . . . . | 1,362                | 612,753            | 54,477           | 64,362        |
| 1918 . . . . . | 1,324                | 625,013            | 53,208           | 68,498        |
| 1919 . . . . . | 1,308                | 672,369            | 57,866           | 77,347        |
| 1920 . . . . . | 1,276                | 747,589            | 68,812           | 87,060        |
| 1921 . . . . . | 1,225                | 789,052            | 75,503           | 95,265        |
| 1922 . . . . . | 1,180                | 826,032            | 83,725           | 107,438       |
| 1923 . . . . . | 1,143                | 895,524            | 98,845           | 124,719       |
| 1924 . . . . . | 1,117                | 1,000,988          | 119,745          | 144,890       |
| 1925 . . . . . | 1,088                | 1,129,455          | 145,858          | 169,197       |
| 1926 . . . . . | 1,066                | 1,257,400          | 171,221          | 193,856       |

**BUILTH** or **BUILTH WELLS**, market town, Brecknockshire, Wales. Population urban district (1931) 1,663. The town is at the focus of the Irfon, Ithon and Wye valleys in a small plain beneath high hills, and as such the region has a marked individuality, already noticed by Nennius. Under the Normans the district became a lordship marcher annexed to that of Brecon, but it fell away on the marriage of William de Breos' daughter. At the east end of the town is a fine moat and bailey castle probably erected by Bernard de Newmarch, with traces of a later stone castle of Edwardian date. As an advanced outpost of the invaders in the upper Wye valley the castle suffered severely, notably at the hands of Llewellyn ap Gruffydd, prince of Wales, in 1260. In this neighbourhood Llewellyn himself fell in ambush in 1282 and with him collapsed much of the Welsh resistance. The lordship remained in the Marches until the Act of Union, 1536, when it was grouped with a number of others to form the shire of Brecknock. With the development of better roads in post-medieval times Builth became an important gathering centre for west Wales cattle for transport by road to England; and its fairs and marts, for sheep and ponies, are still well attended. It is a summer resort, visitors being attracted chiefly by the beautiful surroundings, mineral springs and salmon fishing. The town has a station on the old Cambrian (now G.W.R.) line from Moat Lane to Brecon and has been an urban district since 1894. In 1898 the urban district was made conterminous with the civil parish and renamed Builth Wells. It is included for parliamentary purposes in the joint counties of Brecon and Radnor. (See BRECKNOSHIRE.)

**BUISSON, FERDINAND** (1841- ), French educationist, was born at Paris on Dec. 20 1841. He became an inspector of primary education (1870), inspector-general in 1878, and in 1890 director. He left the Education Department in 1896 to take the chair of education at the Sorbonne, which he held until 1902. His most important written work is his *Dictionnaire de Pédagogie* (1882-93). At the general election of 1902 he was returned to the chamber of deputies as a radical socialist by the XIII<sup>me</sup> arrondissement of Paris. He supported the policy of M. Combes, and presided over the commission for the separation of church and state. He sat in the Chamber until 1914, and re-entered it in 1919. M. Buisson was for 13 years president of the Ligue des Droits de l'Homme and, after retiring from active work in the

Ligue, remained its honorary president. He was one of the earliest advocates of a League of Nations, and in 1916 the Ligue passed a resolution drafted by him that permanent peace could only be secured by this means. His life-work for peace was recognized in 1927 by the award to him of the Nobel peace prize.

**BUITENZORG**, a garden and experiment hill station, in the residency of the same name, Dutch East Indies, area, 37,412 sq.km., bounded on the north by Batavia, west by Bantam, south by West Preanger and east by Krawang. Buitenzorg is beautifully situated south of Batavia, 860ft. above sea-level, with a fairly cool and healthy climate, the average mean temperature for the year being 76.8. Founded by Governor General van Imhoff, in 1745, it has since been the residence of the governor general of the Dutch East Indies. Fast trains from Batavia enable one to visit Buitenzorg and return on the same day. Its botanic gardens are among the finest in the world and were laid out for the government by C. G. E. Reinwardt, formerly professor of botany at Amsterdam who was succeeded by Dr. C. L. Blume. The gardens were thoroughly reorganized in 1868.

The residency of Buitenzorg, pop. (1926) 887,137, occupies the northern slopes of a range of hills separating it from West Preanger, and has a very fertile soil. The chief crops are tea, coffee, rice, rubber and sugar-cane, and nutmegs, cloves and pepper are also grown. The town of Buitenzorg is well laid out, has good hotels, and many attractive buildings; its population of 46,691 includes 3,782 Europeans and Eurasians.

**BUKHARA** (BOKHARA). (1) Town and province in the Uzbek Socialist Soviet Republic. The town, old Bukhara, Lat. 39° 52' N., Long. 64° 30' E. Alt. 1,200ft. Pop. (1926) 71,019. It is the centre of the fertile oasis depending on irrigation from the Zerafshan river; the canal supplying Bukhara is the Shahri-Rud. Water-borne diseases, especially the "rishta" or cotton thread worm, are common, since the water stagnates in the canals. The Labihauz, or tank, in front of the chief mosque, with its shady trees, is picturesque but dirty, as the Zerafshan river is here nearing exhaustion and economy is necessary. Bukhara has a dry, sunny climate with extremes of cold and heat and cloudless skies most of the year. The approach to the city is lined with gardens of apricots, apples, cherries, vines, melons, roses, irises, sunflowers, poppies and tobacco plants. The unburnt brick, one-storied, flat-roofed houses are in striking contrast to the innumerable mosques, amongst which are the beautiful 16th century Mir-Arab, the Mejid-kalyan or Kok-humbez mosque of the emir, near which is the brick minaret 203ft. high, from whose summit state criminals were thrown until 1871. Bukhara is a commercial centre for Central Asia and its bazaar (a noted slave market until the Russian occupation) extends for 7m. with roofs of beaten clay upon undressed timber: its booths display carpets, dress fabrics, karakul (lamb's wool), copper ware, cutlery, trinkets and every variety of Asiatic ware. One section, roofed by a dome of ancient brick work, is set apart for literature. There is a separate market for raw cotton, the production of which increased with the opening of the railway. The population includes Uzbeks, Turkomans, Tadzhiks, Afghans, Arabs, Hindus and a Jewish colony said to have migrated from Baghdad.

Bukhara has always been a centre of Mohammedan learning. When the Mongol invasions of the 13th century laid waste Samarkand and other Muslim cities, it retained its independence and became the chief seat of Islamic culture. It has numerous madrasas (theological colleges) and, though many of their libraries have been scattered or destroyed, there are still literary treasures preserved in private collections, and Afghan, Persian, Armenian and Turkish bibliophiles look to Bukhara for rare texts, so that it is the principal Central Asiatic book market. The present city was begun A.D. 830 on the site of an older city, was destroyed by Jenghiz Khan 1220 and later rebuilt. The Raghistan is the chief square and has a citadel on an artificial eminence 45ft. high, surrounded by a mile of wall and containing the former Emir's palace, the larger houses, the prisons and the water cisterns. The city wall is 28ft. high, 8m. long, and has semicircular towers and 11 gates, but is of little value for defence. In any case Bukhara's fate depends on Samarkand, which can cut off its water supply.

(2) New Bukhara or Kagan, a Russian town near the railway station, 8m. from Old Bukhara, is the centre for the Bogoyetidin district of the Bukhara province, a district which has a population (1926) of 78,69r. (X.)

### HISTORY

The most important part of Bukhara belonged to the country of Sogdiana, which, after the conquest of Alexander the Great formed part of the Seleucid empire. For many centuries this country had been inhabited by the Sakas who, towards the end of the 2nd century A.D., were driven out of the Oxus country by the Yüe-chi, who, in their turn, were ejected by the Ephthalites, or White Huns, in A.D. 450. One hundred years later the Turks of Central Asia defeated the king of the Ephthalites near Bukhara and became possessed of the rich lands between the Oxus and the Jaxartes. The Ephthalites had been engaged in a continual warfare with the Sassanian rulers of Persia, and when the Turkish Khan had driven them out of Bukhara he wrote to the Persian king that "the blood of their common enemy had reddened the waters of the Oxus." Down to the time of the invasion of Transoxiana by the Muslims at the end of the 7th century Bukhara had remained under the overlordship of the Western Turks. The town of Bukhara actually fell in the year A.D. 676. It was not, however, till 30 years later that Transoxiana was finally subdued. The Arab historians gave to the country the name of *Mavera-un-nahr* or "what lies beyond the river" (i.e., the Oxus). Down to the beginning of the 9th century Transoxiana was under the jurisdiction of the governor of the Eastern Provinces of the Caliphate. Hitherto Arabs had been appointed to this governorship, but in 820 it was given to a Persian named Tahir in whose family the post became hereditary. These governors in their turn appointed sub-governors to various provinces and several members of a Persian family known as the Samanids were employed in this capacity in Transoxiana. One of the Samanids named Ismail managed in A.D. 904 to make himself a semi-independent ruler with Bukhara as his capital and founded a dynasty which lasted down to the end of the 10th century. It was under the Samanids—the first Persian dynasty to rule in Islam—that Bukhara became a centre of learning. On the fall of the Samanids Transoxiana again fell into the hands of the Turks, and it continued to be governed by various branches of this race until the Russian occupation. In 1220 Bukhara was sacked by Jenghiz Khan. It attained its greatest importance during the rule of the Shaybanids (1500–99).

Towards the middle of the 19th century Bukhara became an object of rivalry to Russia and England and envoys were sent by both nations to cultivate the favour of its Emir. Two of the English emissaries, Colonel C. Stoddart and Captain A. Conolly, were thrown into prison by the Emir Nasrullah and there put to death in 1842. In 1866 the Russians invaded the territory of Bukhara proper, and crushingly defeated the Emir's forces. In 1868 the Russians entered Samarkand, and a treaty was concluded whereby the Emir of Bukhara became, to all intents and purposes, a vassal to the conquerors and undertook to protect Russian trade. In 1882 a Russian political agent was appointed to reside in Bukhara and a Russian bank was established; thus gradually Bukhara became a part of Russian Turkistan. In 1892 the Emir made a journey to the Russian court and left his two sons to be educated in Russia. In 1920 a Soviet revolution broke out in Bukhara and the Emir took refuge in Afghanistan. In the following year an anti-Soviet Pan-Turanian movement, known as the Basmachi revolt, started in Eastern Bukhara and found a leader in the person of Enver Pasha who arrived in the country at the end of Nov. 1921, got into touch with the fugitive Emir of Bukhara and became his commander-in-chief. The main object of the Basmachi revolt was the creation of a large Pan-Turanian empire comprising Persia, Bukhara, Afghanistan and eventually Turkey. In Jan. 1922 Enver sent an ultimatum to Moscow demanding total abandonment of Turkistan by the Soviet. The Red Army was then despatched to Bukhara and in August the movement was definitely broken by the death of Enver Pasha in a rear-guard action. After the suppression of this rising the two former Russian protectorates of Khiva and Bukhara became "People's Independent Soviet Republics," linked

to the U.S.S.R. as independent contracting parties. In 1924 a new grouping of Turkistan took place according to the national principle and it now consists of three republics, namely: (1) Turkmanistan (capital, Polterask), comprising Khiva and western parts of the frontier Bukhara Khanate; (2) Uzbekistan (capital, Samarkand), comprising the lands inhabited by the Uzbeks and the rest of Bukhara; and (3) Kirghizistan (since re-named Kazakistan). Within Uzbekistan is an autonomous state called Tajikistan (capital, Dushambe), created for that section of the population who speak Iranian languages. (See PERSIA.)

R. Geogr. Soc.* (1870); Hellwald, *Die Russen in Central Asien* (1873); Skrine and Ross, *The Heart of Asia* (1890); Lipsky, *Upper Bokhara*, in Russian (1902); Lord Ronaldshay, *Outskirts of Empire in Asia* (1904); Le Strange, *The Lands of the Eastern Caliphate* (1905); J. Castagné, *Les Basmachis* (Paris, 1925); and V. Barthold, *Turkestan down to the time of the Mongol Invasion* (1927). (E. D. R.)

**BUKHĀRĪ** (Mohammed ibn Ismā'īl al-Bukhārī) (810–872), Arabic author of the most generally accepted collection of traditions (*hadith*) from Mohammed, was born at Bokhara (*Bukhārā*), of an Iranian family, in A.H. 194 (A.D. 810). Already, in his eighteenth year, he had devoted himself to the collecting, sifting, testing and arranging of traditions. He travelled over the Muslim world, from Egypt to Samarkand, and learned (as the story goes) from over a thousand men three hundred thousand traditions, true and false. His theological position was conservative and anti-rationalistic; he enjoyed the friendship and respect of Ahmad Ibn Hanbal. In law, he appears to have been a Shāfi'ite. After sixteen years' absence he returned to Bokhara, and there drew up his *Sahih*, a collection of 7,275 tested traditions, arranged in chapters so as to afford bases for a complete system of jurisprudence without the use of speculative law, the first book of its kind (see MOHAMMEDAN LAW). He died in A.H. 256, in banishment at Kartank, a suburb of Samarkand. His book has attained a quasi-canonity in Islam, being treated almost like the Koran. Pilgrimages are made to his grave.

See F. Wüstenfeld, *Schāfi'ite*, 78 ff.; McG. de Slane's trans. of Ibn Khallikan, i. 594 ff.; I. Goldziher, *Mohammedanische Studien*, ii. 157 ff.; Nawawi, *Biogr. Dict.* 86 ff.

**BUKOVINA**, a small province of Rumania situated at the junction of the Polish, Czechoslovak and Rumanian frontiers at the northernmost point of Rumania. It also adjoins Bessarabia and so is near the Russian frontier. Until 1918 it was a crown land of Austria which it had become in 1849. Originally it had been a principality of Moldavia under Turkish control. It was occupied by Russia in 1769 and by Austria in 1774 to whom it was finally ceded by Turkey in 1777.

It is inhabited mainly by Rumanians and by minorities of Germans and Poles. The capital of the province is Czernowitz (Cernauti) which lies upon the main railway-line that joins Bucharest with Lemberg (Lwów). Bukovina contains some very remarkable examples of Rumanian art and architecture in the shape of the monasteries of Sucevita and Voronetz, which, with many of the churches of the province, have the unique peculiarity of being almost wholly covered with paintings on the outside. Heavy eaves protect much of the painting from the weather. The population of Bukovina numbers 811,721 (1927) with a density larger than in any other part of Rumania. Cernauti is the third largest city of Rumania; pop. 130,000; and has a university with three faculties, founded in 1920.

**History.**—The Bukovina was most probably inhabited by Ruthenian tribes from an early date. Later, it formed part of the Principality of Moldavia, whose ancient capital, Suceava, was in this province. As such, it was long under Turkish suzerainty. It was occupied by Russia in 1769, and by Austria in 1774, to whom it was ceded by Turkey in the following year. Up to 1849 it formed part of Galicia (*q.v.*), being then created a separate crown land. Under Austrian rule many Germans were settled in the province, which made great progress, and was considered a model for the rest of Austria for the harmony which reigned among the different nationalities. On the collapse of the Austro-

Hungarian Monarchy, the last governor, Count Etdorf, handed over the province to the Ruthenes (Oct. 23, 1918). Four days later, representatives of the Rumanians met at Cernowitz and proclaimed a Constituent Assembly which voted the union of the province within its historic boundaries with Rumania. The Assembly then appealed to the Rumanian Government at Jassy for Rumanian troops, which entered Cernowitz on Nov. 11, 1918.

**BULACAN**, a municipality (with 16 barrios or districts), of the province of Bulacan, Luzon, Philippine Islands, on an arm of the Pampanga delta, 22m. N.N.W. of Manila, with which it has railway connection. Pop. (1918), 10,423, of whom 5,013 were males and two whites. Sugar, rice and tropical fruits are the principal products of the fertile region in which it lies, and it is widely known for its fishponds and fish. The chief manufactures are jusi and piña cloth, ilang perfume and sugar. In 1918 it had ten schools, of which nine were public. It was founded in 1578 by the Spaniards, and in 1898 was almost completely destroyed by fire. It has long been an important centre. The language is Tagalog.

**BULANDSHAHR**, a town and district of British India in the Meerut division of the United Provinces. The town is on a height on the right bank of the Kali-Nadi, whence its name Bulandshahr (high town). The population in 1921 was 19,509.

The District of Bulandshahr has an area of 1,904 sq.m. on a level plain, with a gradual but very slight elevation about midway between the Ganges and Jumna. The Ganges canal intersects the district, and serves both for irrigation and navigation. The Lower Ganges canal has its headworks at Narora. In 1921 the population was 1,066,519. The district is very highly cultivated and thickly populated. The chief centre of trade is Khurja, an important centre of the cotton-ginning trade.

Mahmud of Ghazni in A.D. 1018 received the submission of the Hindu raja and his followers to Islam. In 1193 the city was captured by Kutb-ud-din. In the 14th century the district was subject to invasions of Rajput and Mongol clans who made permanent settlements. Under the Mogul empire peace was restored, the most permanent effect of this period being the large proportion of Muslims among the population, due to the zeal of Aurangzeb. The decline of the Mogul empire gave free play to the turbulent spirit of the Jats and Gujars, under the nominal domination of the Mahrattas. After Koil and the fort of Aligarh had been captured by the British in 1803, Bulandshahr and the surrounding country were at first incorporated in the newly created district of Aligarh (1805).

**BULAWAYO**, chief town of Matabeleland, the western district of Southern Rhodesia; 20° 11' S., 28° 41' E.; 4,460ft. above sea-level. Distance by rail from Cape Town, 1,360m., from Durban, 1,162m., from Beira, 676m.

The climate is fairly healthy, though high temperatures are common, especially in October and November, when over 100° may be recorded. The average rainfall is about 26in., concentrated largely in the five months, November to March. The European population in 1926 was 7,650. In addition there are some 9,000 natives and 800 or 900 Indians and coloured.

Bulawayo was inaugurated in 1893 on the site formerly occupied by Lobengula's kraal. It then consisted of a collection of tents. In 1894 the settlement was moved to its present site, 3m. away, though the Government house, built by Rhodes and now the seat of the governor, still occupies the original position. The town is situated amidst undulating, pastoral country. It is laid out on a rectangular plan, centred about the market square.

Bulawayo is well provided with parks, and with grounds for horse racing, cricket, football, tennis, hockey, bowling and golf. Electric lighting and the water-supply are at present in the hands of a private company, but parliamentary powers have been obtained to enable the municipality to raise a loan for the construction of water-works and the supply of electricity. There are several primary and secondary schools, Government and private.

Among the principal buildings and memorials are the stone-built edifice occupied by posts, customs and the municipal offices, the museum, the Matabeleland war memorial, consisting of cloisters, in the garth of which is a large granite monolith, and the large bronze statue of Cecil Rhodes at the junction of two of the principal streets. Bulawayo is the headquarters of the Beira, Mashonaland and Rhodesia railways.

**BULB**, the name applied to the structure formed by many plants from a bud, the outer leaves of which are thick and fleshy by reason of the reserve food-products with which they are crowded. This enables the plant to tide over an unfavourable period, such as a cold or dry spell, safely buried in the earth, and to be ready to come into flower as soon as good conditions return. Bulbs are very characteristic of arid regions such as the South African Karroo. Many of the best known spring flowers are bulbous, e.g., the daffodil, narcissus, hyacinth, etc. The crocus is not technically a bulb, the structure often referred to as such in this plant being a corm, which is the thickened base of a stem.

**BULBUL**, the Persian nightingale (*q.v.*); the name is also used to denote birds of the passerine family *Pycnonotidae* occurring in Africa and southern Asia. The common bulbul of India (*Molpastes fuscus*) is a familiar bird in that country, feeding on fruits and seeds and often nesting on verandas. The pugnacious males, which are crested, are kept by the natives for fighting. The bird has a fine song. The South African *Pycnonotus tricolor* frequently feeds on fermenting fruit to such an extent as to become intoxicated.

**BULDANA**, a town and district of India, in Berar. Pop. of town (1921) 5,691. It was selected on account of its elevation and cooler climate to be the headquarters of the district, but is otherwise quite unimportant. The northern plain in the valley of the Purna is a very rich cotton tract. The southern part, consisting of small plateaux with rich valleys between them, is also fertile. It is bounded on the south by the Nizam's dominions. With 853 sq. miles added in 1905, the area is 3,662 sq.m. and the population (1921) 699,429. Its trading centres are on the railway (Nagpur branch of the Great Indian Peninsular line) and it has several considerable towns, Khamgaon 20,000, Malkapur 15,000, and two other towns of 10,000 each. Cotton is the great commercial crop of the district. *Juar* is the staple food but a considerable area of wheat is also grown and the district is better provided with wells than most of Berar.

**BULDUR** or **BURDUR**, chief town of a vilayet in Turkey. It is called by the Christians *Polydoron*. Its altitude is 3,150ft. and it is situated in the midst of gardens, about 2m. from the Brackish lake, Buldur Geul (anc. *Ascania Limne*). Linen-weaving and leather-tanning are the principal industries. There is a good carriage road to Dineir, by which much grain is sent from the Buldur plain, and a railway connects it with Dineir and Egerdir. Pop. (1927) 42,770.

**BULFINCH, CHARLES** (1763-1844), American architect, was born in Boston (Mass.), on Aug. 8, 1763, the son of Thomas Bulfinch, a prominent and wealthy physician. He was educated at the Boston Latin school and at Harvard, where he graduated in 1781, and after several years of travel and study in Europe settled in 1787 in Boston, where he was the first to practise as a professional architect. Among his early works were the old Federal Street theatre (1793), the first playhouse in New England, and the "new" State House (1798). He was chairman of the board of selectmen of Boston from 1797 to 1818. He provided for new systems of drainage and street-lighting, reorganizing the police and fire departments, and straightening and widening the streets. He was one of the promoters in 1787 of the voyage of the ship "Columbia," which under command of Captain Robert Gray (1755-1806) was the first to carry the American flag round the world. In 1818 Bulfinch succeeded B. H. Latrobe (1764-1820) as architect of the National Capitol at Washington. He completed the unfinished wings and central portion, constructing the rotunda from plans of his own after suggestions of his predecessor, and designed the new western approach and portico. In 1830 he returned to Boston, where he died on April 15, 1844. Bulfinch's work, marked by sincerity, simplicity, and refinement of taste,

greatly influenced American architecture in the early formative period. His son, STEPHEN GREENLEAF BULFINCH (1809-70), was a Unitarian clergyman and author.

See "The Architects of the American Capitol," by James Q. Howard, in *The International Review*, vol. i. (1874); and *The Life and Letters of Charles Bulfinch* (1896), ed. by his granddaughter.

**BULGARIA**, a Balkan kingdom of roughly rectangular shape, lying to the east of the peninsula, with a total area of about 40,000 sq. m. and a population of 5½ millions. The south and west

MAP SHOWING THE PRESENT FRONTIERS OF BULGARIA, AS ADJUSTED BY THE TREATY OF NEUILLY, 1919

frontiers run through hilly country, separating it from European Turkey and Greece on the one hand and Yugoslavia on the other. With Rumania, the frontier is mainly the line of the Danube, while there is an eastern frontage on the Black sea. The transverse Balkan mountains divide the main agricultural area of Bulgaria into two parts, the northern tableland sloping gently down to the Danube and the basins and valleys of the Upper Maritsa system to the south. The latter are cut off physically from the open waters of the Aegean by the Rhodope upland, along or near the crest of which the frontier runs, and politically by Greece, which extends to the lower Maritsa valley. The Maritsa plains have, however, an outlet to the Black sea through the port of Burgas. The Danubian tableland has in Ruschuk a port on the river Danube, and in Varna a more important outlet to the Black sea.

The existing frontiers date in part from the treaty of Berlin in 1878, and in part from later ones, including that of Neuilly (1919). Bulgaria is thus essentially a modern state, having little relation, whether territorially or socially, to the Bulgar empire of the 9th and 10th centuries. The population density of 138 per square mile, considerably above the average for the peninsula, may be associated with the relatively high percentage of arable land, 36% of the total surface being under cultivation, while forests cover nearly 28% of the remainder. Within the peninsula Bulgar, or *Bougar*, means cultivator, or ploughing peasant, with an implication of servitude as compared with the free peasants of Serbia. With this is connected the fact that both in the loess-covered Danubian tableland to the north and in the alluvial basins of the Maritsa to the south of the Balkan mountains there are fairly extensive level and fertile areas, well fitted for cereal cultivation, wheat being particularly important in the northern area.

The second fundamental fact is that the Balkan chain, owing both to the presence of passes and to the slope of the northern tableland, is not, as might be supposed, a barrier between the two agricultural areas. Two great highways may, indeed, be said to converge in the land which has become Bulgaria. One is the route which comes from Central Asia by way of the steppes and grasslands of southern Russia, and can be continued to the south over the Balkan passes. The other is that which links Asia Minor to Europe by the straits, and can be continued along the Maritsa valley, and so to the Morava and the Danube at Belgrade. The two unite in the plains of southern Bulgaria.

In consequence of these two facts—fertile lands able to form a granary for a great power and converging routes—two strands may be said to be interwoven in the history of Bulgaria. So far as the mass of the people is concerned, 80% of whom are peasant cultivators, the ruling passion has been to obtain and then to keep their plots as freeholds. But at successive periods, whenever the power enthroned at Constantinople seemed to be weakening, their leaders have dreamed of making themselves heirs of Byzantium. In the 9th century Simeon, the Bulgar chief, after an unsuccessful attempt to take Constantinople, proclaimed himself Tsar (= Caesar). In 1908, at the time of the Young Turk revolution, Prince Ferdinand of Bulgaria adopted the same title, still held by the reigning king. The participation of Bulgaria in the World War on the same side as Turkey and against her former protector, Russia, may seem at first sign an anomaly. But it has to be remembered that Greece had also Byzantine ambitions, and that Serbia desired to expand along the other great highway which leads to Salonika. Further, with the development of Bulgaria's export trade in cereals, particularly wheat, the question of easy access to the Aegean has become of great importance. The actual result of Bulgaria's participation in the War was the loss of territory, particularly of the small strip on the Aegean coast, obtained at the peace of Bucharest, with the port of Dedeagach.

Essentially, then, post-war Bulgaria is a land of peasant cultivators, producing a surplus of cereals and other agricultural commodities, but deprived of direct access to its western markets by the need of exporting these by the Black sea, with a subsequent passage of the straits.

#### NATURAL REGIONS

From what has been already said it is clear that the country falls into four regions:—the northern or Danubian tableland; the mountain belt of the Balkans; the valleys and basins of the Maritsa system; the part of the Rhodope upland falling within the country, with its north-western continuation, which converges towards the Balkan chain, and a western hill belt separated by the Struma valley.

**Danubian Tableland.**—This, often called the Balkan Foreland, is the area between the low northern scarp of the folded Balkans and the Danube. The Balkans consist largely of schists and granite, with some limestones, while the tableland is floored by undisturbed, horizontally-bedded rocks, mainly cretaceous limestones, often concealed by a deep mantle of loess. The Danube, which forms the northern frontier to a point downstream from Ruschuk, varies in width from 1/5 of a mile to well over a mile and, despite its navigable waterway, forms an excellent boundary. Its Bulgarian bank is high, loess cliffs 5-600 ft. in height rising above the valley floor, while the opposite or Rumanian bank is low. The river is liable to flooding in spring and early summer, as the snows of the plains and higher grounds melt successively, and its valley is swampy, with lagoons rich in fish, especially carp and sturgeon, reed beds and willow brakes. It is malarious in summer and bitterly cold in winter, when navigation is impeded by ice, and the river may freeze over. No bridge crosses the river in Bulgarian territory.

Downstream from Ruschuk the frontier leaves the river to pass in a south-easterly direction to the Black sea, which is reached near the port of Varna. This means that the whole of the Dobruja lies within Rumania. Till 1913 its southern portion was included in Bulgaria, and the present frontier has been drawn quite definitely on strategic grounds. It runs through a gentle swelling of the surface, formerly heavily wooded, to which it owes its Turkish name of Deli Orman, or wild forest. The trees have been largely cut down but patches of stunted oaks remain on the higher levels, where also the limestones appear on the surface, giving rise to a karstic type of country. This wooded belt forms the frontier and dominates alike the steppe areas of the Rumanian Dobruja to the north and the not very dissimilar steppe-like country of eastern Bulgaria to the south.

The tableland, as thus defined, forms a well-marked unit. The underlying tabular rocks display south-to-north faultlines, and the rivers which run north to the Danube follow these. To the

west the Isker, the second largest river in Bulgaria, the Maritsa taking first place, breaks through the whole Balkan chain, thus bringing the high basin of Sofia (1,800ft.) into communication with the Danubian tableland. The valley is traversed by a railway, and the choice of Sofia as a capital is thus justified by the fact that it is linked to both the great productive areas, to the Maritsa plains by the main Belgrade-Constantinople route and its Bulgarian branches, and to the tableland by the Isker valley. Both west and east of the Isker smaller streams rising in the Balkans flow direct to the Danube, the Yantra, to the east, being the largest and most important of these. All carry a comparatively small amount of water, and some even dry up in summer; but owing to the soft loess deposits all have cut out remarkably deep valleys. It is a general rule that the right bank of each stream is higher than the left, where plains of deposition occur.

These deeply-sunk rivers, with their fairly extensive valley plains, are of very great importance from the human standpoint. The plateau levels above, dry because of the limestones which underlie the porous loess, exposed to cruelly cold winds in winter and to desiccating blasts in summer, practically devoid of wood, so that dried dung has to be used as fuel, are remarkably productive, especially in favourable seasons, but do not attract settlement. The valleys have a better climate, owing to shelter from strong winds; spring water is available as compared with the dry plateau above; a greater variety of crops can be produced. They serve, therefore, as natural sites for towns and villages, and Trnovo, in the Yantra valley, should be noted as typical. Once a Bulgarian capital, it owes its greater size and importance as compared with its analogues to its river. This affords a line of access to the Shipka pass (4,363ft.), while one of its tributaries allows the passage of a railway to the Maritsa plains. A certain amount of market-gardening is carried on around the town, and it is characteristic generally of the valleys that, as compared with the almost uniform sweep of the wheat fields above, maize, the bread-plant, is grown, and with it plants like tomatoes and peppers, so important where tasteless maize forms a large part of the diet, as well as such crops as lucerne and sugar-beet. In the more sheltered and lower parts of the valleys the vine can also be grown. These valley settlements, where a measure of protection is obtained both from the rigours of nature and the risk of invasion by man, are a striking feature, and they involve long daily journeys from the home to the fields above.

To the east the Provadi and Kamchik rivers find their way direct to the Black sea instead of to the Danube, Varna being situated near the mouth of the former. In this eastern area the steppe-like character becomes accentuated, and the upper levels may be more suited for summer pastures than for wheat cultivation.

This whole tableland region has undergone great changes since the time of the treaty of Berlin. Before that date it was the seat of great feudal domains, the Turkish *tchiflik*, its physical features fitting it for this form of exploitation. Since that time it has been divided up into small holdings, worked by the peasants, the typical Bulgarians. Their industry, their frugality, their remarkably high level of agricultural skill, their passion for education, have been remarked by all observers. It is inevitable that in view of the conditions and of their history they should show also the defects of their qualities—a thriftiness verging on greed of gain, a “dourness” which is in marked contrast to the light-heartedness of the Serbs. Much of the wheat grown is exported from Varna, and thus forms a money crop, the peasants living chiefly on the cheaper maize. There are no minerals, and the towns, placed mainly either on the Danube or within the tributary valleys, are primarily market centres, with minor industries, usually dependent on the working up of local raw material, such as milling, wine-making, the making of caviare in the Danubian fishing towns, woollen and leather goods. The gold and silver filigree work of Vidin and Ruschuk is interesting, because artisans practising traditional crafts linger in various parts of the peninsula and recall the fact that its early Byzantine civilization did not disappear completely during the long Turkish night when the Ottoman ruled the Balkan peninsula.

**Mountain Belt of the Balkans.**—The Balkan belt is very different from the tableland, both as regards physical features and the human response. From the valley of the Timok, the lower course of which forms the frontier with Yugoslavia, the folded chains extend over a distance of some 375 miles, first in a south-easterly and then in an easterly direction to the Black sea, where they break off abruptly. The gorge of the Isker to the west and the Demir Kapu pass to the east divide them into three sections, of which the central is at once highest, rising to a maximum of nearly 7,800ft., and narrowest, being only some 18m. wide. The western section has a maximum height of a little over 5,000ft., while the eastern is lower and divided into two or three separate ridges.

A striking feature of the chain is the appearance on the south of the “shadow” range of the Anti-Balkans, divided into the Sredna Gora to the west and a narrowed eastern portion called the Karaja Dag. This range is separated from the Balkans proper by the sub-Balkan depression, a very fertile valley area. Its western part is drained by the Striema tributary of the Maritsa, which has cut back between the Sredna Gora and the Karaja Dag and separates the two, and the eastern and larger part by the Tunja, a powerful left-bank tributary of the Maritsa with numerous feeders.

Despite the presence of schists and granites, of which they are largely composed, and the heights to which they rise, the Balkans present generally the appearance of an upland rather than of a mountain chain. Their summits are rounded, forming undulating summer pastures, rocky peaks being absent, and the slopes are heavily wooded, chiefly with oak and beech. To the south, especially in the Central Balkans where there is much faulting, the hill country is separated by high and steep scarps from the fertile sub-Balkan depression; the northern scarp is much lower and less conspicuous. Though as a whole scantily peopled the Balkan region contains a certain number of basins suitable for settlement, of which those of Kotel and Gabrovo may be specially mentioned. Coal, not of very good quality, and not in large amount, occurs on the northern side near Gabrovo and on the southern near Slivno, and there are also oil-springs and some small deposits of copper, lead, and zinc.

It is clear from this description that the Balkan region, despite its elevation and the absence of the wide tracts of fertile soil found in the tableland, has certain advantages of its own. There is a greater variety of products and of possible occupations, for in addition to agriculture, based mainly on the hardier cereals, rye and barley, with buckwheat, the forests give occupation to wood-cutters and charcoal-burners, and the pastures permit of a considerable development of the pastoral industry. Since in addition to the coal beds there is a certain amount of water-power, minor manufactures can be carried on, and the mineral deposits, if insignificant in themselves, are sufficient to support small local industries. Further, in the days before railways, the traffic across the passes afforded an accessory source of wealth and increased the market for local products, particularly saddlery, blacksmith's work, and so forth. Other industries carried on are the making of woollen goods, pottery, cutlery, wooden articles, copper goods, and so on. Apart from these resources the region has gained in the past from the fact that the physical features give some opportunity of evading the control of feudal lords, while at the same time the scarcity of arable land makes such control less profitable and thus not likely to be exerted to the same extent as in more productive areas. In point of fact it is found that some trace of national feeling seems to have persisted even through the days when the Turkish yoke bore heaviest, and certain of the mountain towns and villages served as foci for the Bulgarian nationalist movement. The first Bulgarian schools and libraries were founded in Kotel and Gabrovo, and some of the leaders came from the Sredna Gora region.

**Valleys and Basins of the Maritsa System.**—The Maritsa region, taken in the larger sense to include the sub-Balkan depression, differs profoundly from the two regions already described. Forming the heart of the Eastern Rumelia of the treaty of Berlin, it displays in its climate Mediterranean influences,

while in its crops, including roses for attar, rice, cotton, tobacco, vines, peaches, walnuts, mulberry for silkworm-rearing, with wheat, the effects of the position and of the shelter given by the hills to the north are clearly seen. Towns of ancient origin, such as Philippopolis (Plovdiv), indicate its historical importance as a highway, and the traces of the earlier Turkish occupation its value to the owners of Constantinople. Till the treaty of Berlin and later the population was of a very mixed nature, with Turks, Greeks, and Slavs, in addition to Bulgarians. Since that time the Bulgarian element has increased greatly, but the gardener-cultivators here differ in some respects from the peasants of the tableland.

Of its two sections the sub-Balkan depression is of great interest from the standpoint of physical geography. There is reason to believe that it was once occupied by a continuous river, flowing from west to east and entering the Black sea near the present port of Burgas. It is believed that sections of this hypothetical river were tapped, or captured, successively by feeders of the Maritsa, cutting back into the sub-Balkan range. The result has been to give rise to a series of basins, arranged in a line from west to east, and separated from each other by comparatively low sills. The more westerly of the basins are drained by streams, the Topolnitsa and the Striema, which flow directly to the Maritsa, but the eastern members of the series are strung along the Tunja, a powerful river with a number of tributaries. Where the slopes of the Karaja Dag sink down eastwards to the plain, the Tunja swings round at a sharp angle, running southward to join the Maritsa, beyond the confines of Bulgaria, at the town of Adrianople. The result of this arrangement and of the fact that the Anti-Balkan range is highest in the west, in the Sredna Gora, is that the western basins are smaller, higher, and more definitely cut off by gorges from the main Maritsa valley than the eastern ones. The most easterly, that of Slivno, practically merges into the Maritsa basin, for to the south of it the Karaja Dag is represented only by hilly country.

Among the other basins mention may be made of that of Zlatitsa, the most westerly, containing the town of that name. It is small and noted especially for its fruit-trees, including walnuts. The next basin, that of Karlovo, is watered by the feeders of the Striema, and vines and roses grow freely. But the most important and largest of the basins is that of Kazanlik, in the Tunja section, which has always been celebrated for its beauty and fertility. Here are the most extensive rose gardens in the world, essences being distilled particularly at Stara Zagora; under modern conditions more prosaic crops, such as sugar beet and potatoes, are, however, largely displacing the rose bushes, even though attar is still an important export.

The Maritsa river rises in the Rhodope and after leaving the hills enters a great basin, the largest of the areas of depression which are characteristic of the peninsula. It lies between the Anti-Balkan range to the north and the Rhodope upland to the south and west and thus the river has two sets of tributaries. Those coming from the wooded Rhodope have a fairly even flow, and some of them are used for transporting the timber to the lower grounds. The left-bank tributaries are steep and, flowing as they do mainly over bare slopes, show great fluctuations in volume, and when in flood carry large amounts of silt. The main stream, which has low banks, is constantly changing its course and its valley is marshy. Rice is cultivated on irrigated land, particularly round the junctions of the northerly streams. Maize, wheat, and tobacco are grown somewhat farther from the river, while the slopes are planted with vines, mulberries, and various fruit-trees. Some cotton is grown, the fact being interesting even if the amount is not large. In addition to Philippopolis, Tatar Bazarjik is an important town, and there are many others.

Farther east, towards the north-to-south section of the Tunja and beyond the river, the climate becomes drier and the country more steppe-like. In this district wheat is the main crop, accompanied by stock-rearing, and the wheat-producing area extends to the hinterland of the port of Burgas. Farther south are the slopes of the Istranja hills, which extend to the shores of the Black sea. These are mostly wooded; but the scrub-like character of the

woods, made up of low, twisted and gnarled oaks, indicates the effects of the climatic conditions. This region forms a general exception to the rule that the sub-Balkan depression and the Maritsa basin are areas of great fertility. They owe this fertility to the alluvial deposits by which they are flooded, the loess of the tableland not reappearing south of the Balkans.

**The Rhodope Upland.**—If the Maritsa region repeats, with differences, the characteristics of the tableland, so too the Rhodope upland and its continuations repeat, again with marked contrasts, some of the features of the Balkan chain. Sofia—tucked away in its little upland basin but with arm-like highways stretching out to the eastern productive areas as well as to the west—of ancient origin but modern aspect, is peculiarly representative of Bulgaria. That much of its trade is in the hands of Jews is but one illustration of the difficulty of modernizing rapidly a state mainly peopled by peasants. Another is the intense pre-occupation of the townsfolk with politics of the "realistic" type. A somewhat careful study of the exact relations of the Sofia basin to the mountain massifs and basins of the upland in which it lies is essential in order to grasp the reason why the political history of Bulgaria has been so troubled, and particularly why the Macedonian question has played and is playing so important a part.

**Western Hill Belt.**—So far the name Rhodope has been used in a broad and general sense for the hill country in the south-west of Bulgaria, of which strictly speaking it forms but a part. From the western Balkans, or Stara Planina, there extends south a region of broken country along which the frontier between Bulgaria and Yugoslavia runs. The southern part of this receives the name of Osogovska Planina, and has a certain individuality of its own, due both to its height and to the fact that the Struma river makes a definite line of separation between it and the still higher mountains to the east. The Struma, which has a general north-to-south direction, rises in the Vitosha Planina, south-west of Sofia, a mountain mass rising to heights of over 6,500 feet. After leaving Bulgarian territory it flows through Greek Macedonia to the Aegean. To the east of the valley line is a long belt of mountain country extending from the Vitosha Planina to the Rila mountains, a beautifully wooded group with a maximum height of nearly 9,600ft., and continued into the Pirin Dag to the south and into the Rhodope Planina to the south-east. The Isker river, which passes through the basin of Sofia, rises in the Rila mountains and thus to the south of the source of the Struma, their headwaters overlapping, as it were. The Vitosha mountains form a certain obstacle to routes from Sofia into the Struma valley, but can be turned both to the north-west and to the south-east.

The Struma, running as it does between the complex hill country which bounds the Morava-Vardar furrow on the east and the high and alpine mountains of south-western Bulgaria, is of great importance, and that for two reasons. In the first place the main stream and some of its tributaries pass through basins of considerable fertility, which gain in importance from the surrounding mountain land. Secondly, their valleys open out routes to the heart of the peninsula as well as to the Aegean, these routes acquiring special significance from the fact that they can be reached from Sofia.

Some of the basins may be noted. The highest is that of Pernik (about 2,500ft.) where good brown coal (lignite) occurs. At a much lower level is that of Kustendil (about 1,600 feet). This is very fertile, producing vines, tobacco, and plum trees and having a bathing establishment, due to the presence of hot sulphur springs. From the plain, over the slopes of the Osogovska mountains, there passes an important route to Uskub in Yugoslavia. Of the basins watered by tributaries that of Dupnitsa, traversed by a left-bank tributary and lying in nearly the same latitude as Kustendil, is important. This also is fertile and has direct access to Sofia. Farther down the Strumitsa, a right-bank tributary flowing west to east, has a very fertile valley of which only a part, according to the 1919 treaty, falls in Bulgaria. This valley was the scene of severe fighting during the World War, and affords a good line of access into the region of the lower Vardar valley. Before 1919 the Bulgarian frontier lay farther to the west, and

the chopping of the fertile valley into two parts, if it has a strategic justification, does necessarily increase Bulgarian interest in Macedonia.

The Rhodope and Rila massifs, built as they are of hard rocks, are much more formidable mountains than the Balkan chain. The peaks are bare and rocky with old glacial cirques and moraines dating from the glacial period, and the valleys are deeply cut and steep. Woods are abundant, with beech and oak below and pine and fir above, and there are extensive summer pastures at the higher levels. Though the more elevated areas are unfit for permanent habitation, the margins and the included valleys offer opportunities and are sufficiently diverse to permit of the development of separate human strains. Thus the Rhodope region is the home of the Pomaks or Muslim Bulgarians, who adopted the religion of the Turkish conquerors and became instruments in the oppression of the Christians. They are, or were, mainly wood-cutters and charcoal-burners, while the Vlachs found in the region in summer are, as usual, herdsmen. Another point of interest is that while the monastic life does not as a rule make much appeal to the Bulgarians, the dense woods of the higher mountains here, as in so many parts of Europe, lodge monastic establishments to which great forest tracts were formerly attached. The most interesting of these is the famous Rila monastery, placed at a height of nearly 3,900ft. in the massif of the same name, and a favourite place of pilgrimage. It is of ancient origin, though the existing buildings are modern.

Neglecting the deep gap of the Struma valley and looking at this upland country as a whole, it is obvious that, even more than the easily crossed Balkans, it is fitted to serve as a refuge for fugitives, and thus as a centre for the growth of a spirit of revolt. Bulgaria, as has been seen, arose as a unified state in the period 1878-1908 by the combination of the two productive areas linked by the Balkan passes. But to the west of the great upland lie the basins and hills of Macedonia, where the cultivating peasants were also oppressed by the Turkish conquerors. The Struma and its feeders link Sofia to Macedonia by various routes, not difficult as difficulty is counted in the peninsula. Apart altogether from the much disputed question of the "racial" affinities of the Macedonians, the position of Sofia made it inevitable that Bulgarian politicians should interest themselves in the Macedonian problem, both with a view to the enlarging of the state boundaries and in the hope of connecting the state capital directly with the Aegean. The great complexity of the structure of the peninsula, and particularly the fact that the rivers tend to flow through sunken basins, capable of settlement, but separated rather than linked by gorges difficult of passage, has made the drawing of frontiers satisfactory both from the strategic and economic standpoint an almost insoluble problem. It is this geographical fact rather than the real or supposed racial differences between Serbs and Bulgarians that is the basis of many of the troubles of the peninsula.

**Population and Government.**—About 81% of the population is Bulgarian, nearly 11% of the rest being Turkish in 1920. The proportion of Slavs, Jews, and foreigners is small. Elementary education is free and obligatory and the number of illiterates remarkably small, the Bulgarians displaying much enthusiasm for education. The majority of the people belong to the Orthodox Bulgarian church, but there is a considerable number of Muslims and a fair proportion of Roman Catholics. The legislative authority is vested in a single chamber, the Sobranie, which consists of 227 members. There is universal manhood suffrage. (See BALKAN PENINSULA.)

**BIBLIOGRAPHY.**—A *Handbook of Bulgaria*, compiled by the Geographical Section of the Naval Intelligence Division, Naval Staff, Admiralty; H. Grothe, *Bulgarien. Ein Beitrag zur Landeskunde* (1921); L. Lamouche, *La Bulgarie* (1922). (M. I. N.)

#### DEFENCE

**Historical.**—From the earliest times (A.D. 678) when the Bulgarians, a Slavonian tribe, first established a kingdom, the country has at intervals been the scene of turbulence and bloodshed. After suppression by the Emperor Basil in 1014, the kingdom was re-established in 1186, but only to be again suppressed and annexed to

Turkey in 1396. In modern times a revolution against Turkish rule in 1876 was ruthlessly suppressed. From the date of the war against Serbia in 1885-86, Bulgaria was the scene of constant revolutions and of participation in wars against Balkan neighbours until, in 1915, the Bulgarians seized the opportunity to strike a deadly blow from the rear against the army of her old enemy, Serbia, then engaged against an army of the Central Powers. The Bulgarian army thenceforward held its own against an Allied army operating from Salonika until the tide had turned definitely in favour of the Allies, when Bulgaria was the first to sue for an armistice (Sept. 29, 1918) which was followed by a peace treaty in which the Allied triumph was embodied. Bulgaria still had an intact army of about 400,000 (ration strength) with reserves of about 112,000 at the close of the World War.

**Present-day Army.**—Since the conclusion of the Treaty of Neuilly-sur-Seine (Nov. 27, 1919) present-day Bulgaria has possessed land frontiers of 1,765km. and 267km. of coast on the Black sea, as shown below. Universal compulsory military service was abolished by that treaty, and only voluntary enlistment was allowed. The total number of military forces was limited to 20,000, including officers and depot troops. The maximum strength of an infantry division (the largest formation allowed) was limited to 414 officers and 10,780 other ranks, of a cavalry division to 259 officers and 5,380 other ranks, of a mixed brigade to 198 officers and 5,350 other ranks. The minimum strength of these and of all smaller units, whether comprised therein or not, was also prescribed. A maximum number of three guns, of two medium or light trench mortars and 15 machine guns or automatic rifles per 1,000 men was laid down. No piece of over 105 mm. calibre was permitted except in the armaments of fortified places. The number of *gendarmes* and similar organizations armed with rifles was limited to 10,000, and of frontier guards to 3,000. The grand total of rifles in Bulgaria is thus 33,000. Officers must serve for at least 20 years with the active army, not more than 5% retiring annually; other ranks for 12 consecutive years.

**Recruiting and Service.**—In accordance with the above, recruiting in the Bulgarian army is voluntary, with enlistment for 12 years which may be extended up to the 40th year of age. Enlistment may be at any age between 18 and 28. Enlistment in the *gendarmerie* and frontier force is for 12 years, with possible extensions up to the age of 50 years. The budget effective strength of the army in 1927-28 was 19,970, including 999 officers, and of the *gendarmerie* and frontier guard 9,798. Additional officials and employees numbered 2,527. The usual arms and auxiliaries are included. The infantry is organized in six regiments of three battalions, the cavalry in three regiments of four squadrons, the artillery in eight groups, of which five are equipped with field guns; there are five battalions of engineers, two railway battalions and one communication section.

**Higher Command.**—The Ministry of National Defence is the supreme military authority. The Ministry includes inspectors of the various arms, besides departments for dealing with finance, military law, topography, education and auxiliary services. The army staff deals with organization, recruiting, military training, supplies, Bulgarian defence and education of officers. The War Council, an advisory body embodied in the Ministry, is convened, when necessary, under the authority of the minister of war.

**Distribution.**—The frontier guard, a special body of dismounted men, is organized in eight sectors, each being responsible for three frontier posts. The frontiers with Turkey measure 208km., with Greece 459km., with Yugoslavia 498km., and with Rumania 600km., making a total land frontier of 1,765km. The sea coast measures 267km. The army units are distributed fairly evenly amongst the centres of population.

**Military Education.**—In accordance with the Treaty of Neuilly, there is only one military school for cadets. They provide the officer class from the age of 20 and upwards, up to the age of 45 for captains, 50 for majors and lieutenant-colonels, 55 for colonels and 60 for generals. There are also special courses for private soldiers to qualify for promotion to non-commissioned rank, and also for non-commissioned officers. The military academy is directly under the Ministry of War.

**Special Armament and Permanent Fortresses.**—Every battalion of infantry contains a machine-gun company, a bombing company and three rifle companies. A cavalry squadron contains a machine-gun section. Engineer battalions and communication sections each contain a machine-gun group, and railway battalions each a machine-gun section. No special training doctrine has been disclosed. The Treaty of Neuilly forbids the construction of new fortifications or fortified places in Bulgaria, and the armament of such places, as existing in Nov. 1919, may not be strengthened. Ammunition supply must be limited to 500 rounds for each piece of 10.5cm. calibre or above, and to 1,500 rounds for that and for lower calibres. Army air services are forbidden by the Treaty of Neuilly. Estimates for civil aviation appear in the civil budgets.

### ECONOMICS AND TRADE

Bulgaria consists of two mountain ranges, the Balkans and the Rhodopes, and two valleys. The Balkans run just north of her central line, almost due east and west, and the Rhodopes, breaking off from them on Bulgaria's western frontier, curve round in a south-easterly sweep until they straighten out again so as to run almost parallel with the Balkans above them. Between these two ranges is enclosed the valley of the Maritsa, which gradually widens out towards the Black sea as the Maritsa leaves it and twists southwards to its outlet at Dedeagatch. As a result largely of the mountainous character of the country the proportion of the total area (103,146sq.km.) used for agricultural purposes is only about 38%. Over a third of the area is covered by forest and over 27% is wholly unproductive. But of this forest land a large part is unproductive scrub, and many of the real forests are inaccessible. Indeed, the wood imports into Bulgaria exceed her exports. The area immediately available for the production of wealth in Bulgaria is, therefore, small, and although the soil in certain districts is extremely rich the agricultural production and the wealth of the country are both low. Over 80% of the population are engaged in agricultural pursuits, and such industries as exist (flour-milling, spinning and weaving, cigarette manufacture, etc.) are relatively unimportant.

**Agriculture.**—Until 1879 Bulgaria was under Turkish domination. Between 1911 and 1918, with but brief intervals, she was at war. The land, except the communal pastures and the forests, is owned by the peasants, and there are no large holdings. As a result of these facts the system of agriculture in Bulgaria remains extremely primitive. A large proportion of the ploughs used are made of wood; corn is usually sown by hand; artificial fertilizers are not used, and farm manure only to a very restricted extent.

Before the World War, wheat was at once the most important agricultural product and article of export. In 1910 over a million hectares were devoted to its cultivation; the crop amounted to 1,148,000 metric tons, and exports, including wheaten flour, to about 300,000 metric tons. Great changes followed the war. Between 1910 and 1923 the area under cereals dropped by 13%, while that devoted to tobacco rose from 7,800 to 60,000 hectares. Before the Treaty of Bucharest the tobacco industry in Bulgaria was of quite minor importance. The rapid increase in prices during the war, however, stimulated its cultivation, and after the Armistice, Bulgaria seized the opportunity which the continuation of hostilities between Greece and Turkey afforded her, and rapidly expanded the acreage devoted to tobacco. Her post-war economic recovery must largely be attributed to this fact. But after the final settlement at Lausanne of the war between Turkey and Greece, and the revival of these two countries as producing areas, the supply of oriental tobacco became excessive, and the acreage under this crop in Bulgaria had sunk by 1927 to 26,000 hectares. As the tobacco area shrank more land was devoted to cereals, cotton, sugar-beet and other industrial crops, more especially oleaginous plants. But the area under cereals in 1927 was still 6% lower than in 1910. Meanwhile the population grew, partly

on account of the immigration of refugees, from 4,338,000 in 1910 to 5,483,000 in 1926. As the total production of cereals in 1927 was somewhat lower than it was before the outbreak of the Balkan wars, the production per head and in consequence the exportable surplus has been seriously reduced. The extent of the change which has taken place may be judged from the following summary figures:

CEREALS: PRODUCTION, TRADE AND CONSUMPTION

|                           | Average 1909-11.       |               | Average 1924-26.       |               |
|---------------------------|------------------------|---------------|------------------------|---------------|
|                           | Total m. tons. (ooo's) | Per head. kg. | Total m. tons. (ooo's) | Per head. kg. |
| Imports . . . . .         | 8.6                    | ..            | 26.2                   | ..            |
| Production . . . . .      | 2,409.6                | 563           | 2,240.8                | 415           |
| Imports and production    | 2,418.2                | 566           | 2,267—                 | 419           |
| Exports . . . . .         | 617.6                  | 144           | 231.7                  | 42            |
| Available for consumption | 1,800.6                | 421           | 2,035.3                | 377           |

In view of this reduction in the available surplus of corn, considerable importance must be attached to the endeavour to promote the cultivation of higher value crops such as sugar-beet, cotton, sesame seed, etc. These crops are not intended so much to replace cereals as export articles, as to supply the domestic requirements and hence lessen the necessity for import.

Of still greater importance, however, are the attempts which are being made to increase the production per hectare by the introduction of modern machinery, the improvement of methods of agriculture, the establishment of model farms, and the improvement of stock by cross-breeding.

Owing to the configuration of the land, Bulgaria is well adapted for a mixed system of agriculture, the mountain slopes affording adequate pasturage for a considerable head of beasts. Her herds and flocks are in fact large, and she has more sheep in proportion to her population than any other country in Europe. Although the most recent statistics relate to 1920, there is reason to believe that the numbers of her livestock are considerably greater than they were immediately before the World War. The cattle, however, are mainly used for draught purposes, and the export of meat and live animals is smaller now than it was in 1910 or 1911.

**Industry and Mining.**—As already stated, the industries in Bulgaria are of minor importance, and with three exceptions—the preparation of tobacco leaf, the distillation of attar of roses, and flour-milling—they are confined to the domestic market. In 1926 the total capital of the so-called "large industries"—this term excludes tobacco and rose oil which are grouped with agriculture—amounted to just under £4,000,000. But the peasant himself supplies most of his own requirements, spinning and weaving his own textiles and making his own shoes.

Although the country is reported to be rich in minerals, the only mines of importance are those of soft coal, which are almost all owned by the State. Of the total output in 1926, viz., 1,114,000 metric tons, only 147,500 metric tons were extracted from private mines. The total production is adequate to meet the needs of the country and even to allow a small surplus for export when prices are favourable. In addition, small quantities of copper and lead ore are mined.

**Trade.**—The international trade of Bulgaria necessarily consists of the exchange of agricultural products for cheap manufactures. Just under one-third of her imports consists of textiles, mainly for the town population, and about one-third of machinery—largely agricultural—and other manufactures of metals. The composition of her exports has undergone considerable changes owing to the increase in the importance of tobacco and the falling-off in the available supply of cereals. In 1910 cereals accounted for nearly 60% of the total exports by value, and in 1924-26 for only about 33%. The most important drop was in wheat, from about 30% to 5% or less. On the other hand tobacco leaf, which in 1910 represented less than 2%, amounted in 1924 to 32%, in 1925 to 41% and in 1926 to 37% of total values.

The published statistics of Bulgarian trade must be read with considerable caution, as owing to the system of valuation employed the real value of her exports is understated. Moreover,

#### URBAN AND RURAL VIEWS OF BULGARIA

1. Aerial view of Alexander Nevsky place, in the centre of Sofia, capital of Bulgaria, showing new Saint Alexander Nevsky cathedral. 2. Aerial view of National Assembly place, in Sofia, showing Parliament building in centre and monument of Alexander II. 3. A street in a provincial town, Gorna Djumaya, south-west Bulgaria, centre of the Bulgarian tobacco-growing

industry. 4. A typical Bulgarian landscape. A village built on a sloping plain, next to a mountain stream. 5. Ploughing a field near Sofia. The soil in Bulgaria is excellent; over 70 per cent. of the population is engaged in farming. 6. Women, on mountain farm near Rustchuk, stringing tobacco leaves for drying. Tobacco is one of chief products of Bulgaria

### SCENES IN THE TOWNS AND MOUNTAINS OF BULGARIA

1. Gabrova, a town on the Upper Yantra river, at the north end of Shipka pass. The town occupies both banks of the river and because of its plentiful water-power has prosperous industries
2. Sofia, the capital of Bulgaria, showing the Maria Luisa boulevard and the Banya-Bashi mosque, the only Muslim temple in Sofia still used for worship. Sofia was chosen as the capital of Bulgaria because of its strategic position in the Balkans, commanding the routes to Constantinople and Belgrade
3. The Shipka pass through the Balkan mountains, between the towns of Kazanlik, on the south side, and Gabrova, on the north side. The pass is 4,363 feet high and, although very steep and winding, is a route for wheeled traffic
4. Belogradchik, a town in north-west Bulgaria, built on a hillside beneath red sandstone pinnacles. Situated on these pinnacles is a fort originally built to protect the frontier against Serbia. Infantry stationed at the fort are shown in the foreground

confusion has been caused by the inclusion in the 1926 statistics of a considerable quantity of imports on Government account which were actually paid for in earlier years. If allowances be made on these two accounts the following approximate results are obtained:

BULGARIAN COMMERCE: IN PAPER LEVA (000,000's OMITTED).

**Public Finance.**—In the following table are shown the revenue and expenditure for the financial years 1923-24 to 1926-27:

|   | Leva (000,000's omitted). |          |          |          |
|---|---------------------------|----------|----------|----------|
|   | 1923-24.                  | 1924-25. | 1925-26. | 1926-27. |
|   | Closed accounts.          |          |          |          |
| Receipts:                               |                           |          |          |          |
| Ordinary budget                         | 5,361.7*                  | 6,858.—* | 6,364.3  | 6,234.4  |
| Total receipts                          | 5,365.5                   | 7,274.6  | 6,381.3  | 6,344.5  |
| Expenditure:                            |                           |          |          |          |
| Ordinary budget                         | 4,956.—                   | 5,899.—  | 6,284.6  | 6,152.4  |
| Extraordinary budget                    | 229.3                     | 521.5    | 580.5    | 316.4    |
| Total expenditure (with<br>other items) | 5,468.3                   | 6,726.—  | 7,149.6  | 6,737.8  |
| Balance                                 | -102.8                    | +548.6   | -768.3   | -393.3   |

\*Including gross receipts from the Pernik mine. If, as in the budgets for the following financial years, only net receipts be included, the total ordinary revenue in 1924-25 would be about 6,650 million leva.

In June 1922 a law was passed limiting the advances which the State might obtain from the national bank to 4.7 milliard leva, and about the same budget equilibrium was established. In the financial year 1924-25 the ordinary revenue, after excluding the gross receipts of the Government coal-mine, amounted to as much as 6,650 million leva. But in the following year the country was affected by the fall in the prices of agricultural products and the general economic difficulties which characterized this period. Hence revenue fell off, while expenditure, in view of the favourable results of the previous year, had been increased to 7,150 million leva. There resulted a deficit of 768.3 million leva, and vigorous measures were taken in 1926 and more especially 1927 to reduce expenditure and re-establish the finances on a sound basis.

According to the settlement reached in March 1923 the reparations debt was fixed at 2,250 million gold francs divided into two blocks. Block B, which is by far the greater, amounting to 1,700 million gold francs, bears no interest and on it no payments are due until April 1953. Payments on account of block A rise from 10 million gold francs in 1927-28 to 20 million in 1932-33, 32.9 in 1933-34, and 43.4 thereafter until 1982-83. The total payments on account of all forms of foreign debt on which a settlement had been reached amounted in 1927-28 to 31.7 million gold francs. Of the total domestic debt of 4,768 million leva (176.7 million gold francs) 4,516 million leva were in Sept. 1927 due to the national bank.

In 1926 a loan was raised of £3,300,000 for the settlement of the refugees from neighbouring lands, a general scheme of settlement having been elaborated by the League of Nations. This scheme differs from the parallel undertaking in Greece inasmuch as the majority of the refugees are placed in existing villages and

not in new colonies. Their gradual return to production should do much to accelerate the economic development of the countryside.

**The Economic Mechanism.**—In a country divided by mountain ranges, with relatively sparse railway connection and bad roads, with a peasant population which has not yet enjoyed half a century of independent national life, economic progress must necessarily depend largely on the tutelary activity of its Government, and the economic mechanism is likely therefore to be State-controlled. So in Bulgaria the railways and the coal-mines belong to the State, and the two most important credit institutions, the national bank and the agricultural bank, as indeed also the co-operative bank, are State institutions. The agricultural bank supplies credit against crops, stock or personal guarantee to the peasants or the agricultural co-operative societies, having a considerable number of branches scattered throughout the country. The central co-operative bank centralizes the credit activities of the institutions dealing with the productive and wholesale co-operative societies. As a general rule the agricultural co-operatives are based on the Raiffeisen, and the others on the Schultze Delitz system. (A. Lov.)

### HISTORY

The ancient Thraco-Illyrian race which inhabited the district between the Danube and the Aegean, were expelled or absorbed by the great Slavonic immigration which lasted from the 3rd to the 7th century A.D. The many tumuli found in all parts (see Herodotus v. 8) and some stone tablets with bas-reliefs remain as monuments of the aboriginal population, and certain structural peculiarities, common to the Bulgarian and Rumanian languages, are perhaps due to the influence of the primitive Illyrian speech. The Slavs, an agricultural people, were governed, even in those remote times, by the democratic local institutions to which they are still attached; they possessed no national leaders or central organization and their only political unit was the "pleme," or tribe. They were considerably influenced by contact with Roman civilization. It was reserved for a foreign race, altogether distinct in origin, religion and customs, to give some unity and coherence to the scattered Slavonic tribes.

**The Bulgars.**—The Bulgars, a Turanian race, akin to the Huns and Avars, belonged to the wave of migrants which came westward behind the Huns. They were a horde of wild horsemen, fierce and barbarous, and governed despotically by their *khans* (chiefs) and *boyars* or *bolyars* (nobles). Their religion, about which little is known, was probably polytheistic, although some of them had certainly embraced Islam. Men and women wore baggy trousers, and the women veiled their faces, while the men wore large turbans over heads shaven clean. Their principal food was meat, and they lived by and from war. In the 4th century the Bulgars had reached the steppes between the Urals and the Volga; by in A.D. 433, their federation split into two groups—the Utiguri and the Kutriguri. The latter were at first the more powerful. For 100 years they formed a strong state on the north coast of the Black sea, whence they formed a continual menace to the eastern Roman empire. About A.D. 560 this state was annihilated by the Avars, who absorbed the survivors into their ranks, and herewith the Kutriguri disappear from history. The Utiguri, living farther eastward, were subject only a few years to the Avars, and after these had passed on, to the Turks. In A.D. 582 they recovered their independence and founded a state on the Volga, remains of which survived into the 13th century under the name of Great (or Black) Bulgary. A tribe of Utiguri, under their khan Asparuch, or Isperich, moved westward, before the pressure of the expanding Khasar state, crossed the Danube in 679 and, after subjugating the Slavonic population of Moesia, advanced to the gates of Constantinople and Salonika. The east Roman emperors

BY COURTESY OF THE NATIONAL BOARD OF THE Y.M.C.A.  
COSTUME OF BULGARIAN WOMAN

were compelled to cede to them the province of Moesia and to pay them an annual tribute. The invading horde was not numerous, and during the following centuries it became gradually merged in the Slavonic population. Like the Franks in Gaul, the Bulgars gave their name and a political organization to the more civilized race which they conquered and whose language, customs and local institutions they adopted. No trace of the original Bulgarian tongue remains in the language now spoken in Bulgaria.

**Early Dynasties.**—The early Bulgarian state lay along both banks of the Danube, although the suzerainty of their khans over the northern bank, which at the time was practically a no-man's land, was probably always shadowy. Khan Krum (802–804) and his son Omortag (814–831) succeeded to the heritage of the Avars in much of eastern Hungary and Transylvania, but with the arrival of the Magyars and Petchenegs (*q.v.*) at the end of the 9th century, all territory north of the Danube was abandoned and even the southern half of the Danube valley was depopulated by raids and filled with alien races who settled there in considerable number. The expansion of the Bulgar empire southward was more lasting. In numerous campaigns against Byzantium, the Bulgar khans gradually extended their frontiers, and Kardam (777–802) and Krum again exacted the tribute paid to Asparukh. Khan Krum waged a desperate campaign against the emperor Nicephorus, who invaded Bulgaria and burned Preslav; but Krum annihilated the army as it returned through the Balkan passes (811), slew the emperor and converted his skull into a drinking goblet. In following years he devastated Thrace “like a new Sennacherib” and besieged Constantinople itself, and the city was only saved by his sudden death. Khans Pressian (836–853) and Boris (857–888) extended the frontier of Bulgaria far to the south-west, to include Debar, Okhrida and all the upper Struma valley, as well as the Morava valley on the west. The great majority of the enlarged Bulgarian state was now almost purely Slavonic; and for 300 years, while the whole of north-eastern Bulgaria was repeatedly ravaged by Russians, Magyars, Petchenegs and Cumans, the Slavonic centre and the south-west was to become even more the centre of gravity of the Bulgarian state. This process was accelerated by the official introduction into Bulgaria of Christianity by the disciples of the “Apostles of the Slavs,” S. S. Cyril and Methodius. The adoption of the Slavonic or “Old Bulgarian” language as that of the official liturgy was the final stage in the assimilation of the original Bulgar race. Boris probably adopted Christianity from political motives, although according to legend he was frightened into it by the ghastly pictures of Hell painted on his palace walls by a Byzantine monk, and he ended his own days in a monastery. The great controversy between Rome and Byzantium regarding the Patriarch Phocas had broken out in 860. Boris long wavered between the rival churches, but when the Pope failed to fulfil the hope that he had held out of granting Bulgaria an independent and national Patriarch, Boris, in 870, decided for the Eastern Church. The decision was fraught with momentous consequences for the future of his country. The nation altered its religion in obedience to its sovereign, and some of the boyars who resisted the change paid with their lives for their fidelity to the ancient belief. The independence of the Bulgarian Church was recognized by the Patriarch, a fact much dwelt upon in recent controversies. The Bulgarian primates subsequently received the title of Patriarch; their see was transferred from Preslav to Sofia, Voden, and Prespa successively and finally to Okhrida.

**The First Empire.**—The national power was at its zenith under Simeon (893–927), a monarch distinguished in the arts of war and peace. In his reign, says Gibbon, “Bulgaria assumed a rank among the civilized powers of the earth.” It was under Simeon that the trans-Danubian possessions were finally lost, but he extended his frontiers to the Adriatic in the south-west and also brought the Serbs under his sway, which now reached as far as the Sava and the Drina. Having become the most powerful monarch in eastern Europe, Simeon assumed the title of “Emperor and Autocrat of all the Bulgars and Greeks,” a style which was recognized by Pope Formosus. He aspired, however, to a higher title still. His numerous campaigns against Byzantium were

prompted by the ambition to place on his head the Imperial crown; and his pursuit of this dream left his country nearly exhausted. While he reigned his people made great progress in civilization, literature flourished, and his capital Preslav is reputed as rivaling Constantinople in magnificence, and full of “high palaces and churches.”

**The West Bulgarian Empire.**—After Simeon's death, the Bulgar power declined owing to internal dissension. The upper classes were demoralised by the Greek manners introduced by Simeon's wife, and the peasants, whose lot was not happy, embraced in large numbers the doctrines of pacifism and equality preached by the Bogumils (*q.v.*) who acquired great prominence at this time. Serbia recovered its independence in 931 and Macedonia, under a certain Nicola, the “Comes” or prince of the Slavonic Bersites in northern Macedonia, revolted successfully in 963, Nicola soon after assuming the title of tsar. New waves of eastern invaders harassed northern Bulgaria; and in 972 the Emperor John Zimisces took advantage of the inroad of Russia to dethrone Tsar Boris II. and recover eastern Bulgaria for the Roman empire. Macedonia, however, under Nicola, retained its independence, and Nicola's son Samuel (980–1014), actually recovered Serbia and northern Bulgaria for this new “Bulgarian” empire, and extended his power southward to Thessaly; but in 1014 he was defeated at Belasitsa by the emperor Basil II., surnamed Bulgaroktonos, who put out the eyes of 15,000 prisoners taken in the fight. Samuel died of grief and a few days later his dynasty was extinguished; for more than a century and a half (1018–1186) all the former Bulgarian territories remained subject to the Byzantine emperors.

**The Second Empire.**—After a general insurrection of Vlachs and Bulgars under the brothers Ivan and Peter Asen of Trnovo, northern Bulgaria recovered its independence (1185) and Ivan Asen assumed the title of “Tsar of the Bulgars and Greeks.” The Asens asserted their descent from the old rulers of Bulgaria; but they are said, actually, to have been of Vlach origin, and are generally referred to in contemporary documents as “Tsars of the Vlachs and Bulgars.” They received great assistance from the Cumans, now settled on the north banks of the Danube, to whom they were allied by treaty and marriage. Kaloyan, or Joanitsa, the third of the Asen monarchs, extended his dominions to Belgrade, Nish, and Skopje; he acknowledged the supremacy of the Pope who, in his own words, “extolled him above all other Christian monarchs,” received the royal crown from a papal legate and was certainly the strongest party in the three-cornered warfare which was waged for many years between the Byzantine empire, the Crusaders (at that time established in Constantinople), and the Bulgars. The greatest of all Bulgarian rulers was Ivan Asen II. (1218–41) a man of humane and enlightened character. After a series of victorious campaigns he established his sway over Albania, Epirus, Macedonia and Thrace, and governed his wide dominions with justice, wisdom and moderation. In his time the nation attained a prosperity hitherto unknown; commerce, arts and literature flourished. Trnovo, the capital, was enlarged and embellished, and great numbers of churches and monasteries were founded or endowed. At this period, to judge from the chronicles of the Crusaders, Bulgarian civilization was on a level with that of Europe. The dynasty of the Asens became extinct in 1280. None of their successors were able to establish a strong central authority, and feudal anarchy prevailed. Further, northern Bulgaria was repeatedly ravaged by the invasions of Mongols, to whom it was vassal in 1202–95. Two other dynasties, both of Cuman origin, followed—the Terterovtsi, who ruled at Trnovo, and the Šišmanovtsi, who founded an independent state at Vidin, but afterwards reigned in the national capital. Eventually, on July 28, 1330, Tsar Michael Šišman was defeated and slain by the Serbians, under Stephen Uroš III., at the battle of Velbuzhd (Kustendil). Bulgaria, though still retaining its native rulers, now became subject to Serbia, and formed part of the short-lived empire of Stephen Dušan (1331–56). The Serbian hegemony vanished after the death of Dušan, and the Christian races of the Peninsula, distracted by the quarrels of their petty princes, fell an easy prey to the Muslim invader.

In 1340 the invading Turkish forces had begun to ravage the entire valley of the Maritsa; in 1362 they captured Philippopolis, and in 1382 seized Sofia. In 1366 Ivan Šišman III., the last Bulgarian tsar, was compelled to declare himself the vassal of the Sultan Murad I. In 1389 the rout of the Serbians, Bosnians and Croats at Kosovo Polje decided the fate of the Peninsula. Shortly afterward Ivan Šišman was attacked by the Turks; and Trnovo, after a siege of three months, was captured, sacked and burnt in 1393. The fate of the last Bulgarian sovereign is unknown: the national legend represents him as perishing in a battle near Samokov. Vidin, where Ivan's brother, Srazhimir, had established himself, was taken in 1396, and with its fall the last remnant of Bulgarian independence disappeared.

The five centuries of Turkish rule (1396-1878) form a dark epoch in Bulgarian history. The invaders carried fire and sword through the land; towns, villages and monasteries were sacked and destroyed, and whole districts were converted into desolate wastes. The inhabitants of the plains fled to the mountains, where they founded new settlements. Many of the nobles embraced Islam; others, together with numbers of the priests and people, took refuge across the Danube. Among the people only the Bogumils adopted Islam in large numbers: the Pomaks of the Rhodopes were converted only in the 17th century. Large colonies of true Turks were, however, settled in the plains both north and south of the Balkans, the true Bulgarian element being driven back into the less fruitful districts. All the regions formerly ruled by the Bulgarian tsars, including Macedonia and Thrace, were placed under the administration of a governor general, styled the beylerbey of Rumili, residing at Sofia; Bulgaria proper was divided into the sanjaks of Sofia, Nikopolis, Vidin, Silistria and Kiustendil. A new feudal system replaced that of the *boyars*; fiefs or *spahiliks* were conferred on the Ottoman chiefs and renegade Bulgarian nobles. The Christian population was subjected to heavy imposts, the principal being the *haratch*, or capitation-tax, paid to the imperial treasury, and the tithe on agricultural produce, which was collected by the feudal lord. Among the most cruel forms of oppression was the requisitioning of young boys between the ages of ten and twelve, who were sent to Constantinople as recruits for the corps of janissaries. Yet the conquest once completed, the condition of the peasantry during the first three centuries of Turkish government was better than it had been under the tyrannical rule of the boyars. Military service was not exacted from the Christians, no systematic effort was made to extinguish either their religion or their language, and within certain limits they were allowed to retain their ancient local administration and the jurisdiction of their clergy in regard to inheritance and family affairs. Many districts and classes enjoyed special privileges: chief of these were the merchants, miners, and the inhabitants of the "warrior villages" (*voinitchki sela*), who received self-government and exemption from taxation in return for military service. Some of these towns, such as Koprivštitsa in the Sredna Gora, attained a great prosperity, which declined after the establishment of the principality. So long as the Ottoman power was at its height, the lot of the subject-races was tolerable. Their rights and privileges were respected, the law was enforced, commerce prospered, good roads were constructed, and the great caravans of the Ragusan merchants traversed the country. Down to the end of the 17th century there was only one serious attempt at revolt, as distinguished from the guerilla warfare maintained in the mountains by the *haiduti*, or outlaws: that occasioned by the advance of Prince Sigismund Bathory into Walachia in 1595. Both this revolt, and an equally unsuccessful rising in 1688, were arranged in conjunction with Austrian forces; but after the peace of Belgrade (1739) Austria abandoned her active Balkan policy. Her heritage was taken over by Russia, who as early as 1687 had for political reasons assumed the role of protector of the Orthodox Christians of the Balkans; a claim officially put forward in the Treaty of Kuchuk Kainarji (1774). As the power of the sultans declined after the unsuccessful siege of Vienna (1683), anarchy spread through the Balkans; although Bulgaria, being nearer the capital, still suffered less from the oppressions of the feudal lords than the remoter districts. Early

in the 18th century, however, the inhabitants suffered terribly from the ravages of the Turkish armies passing through the land during the wars with Austria. Towards its close their condition became even worse owing to the horrors perpetrated by the Krdzalis, or troops of disbanded soldiers and desperadoes, who, in defiance of the Turkish authorities, roamed through the country, supporting themselves by plunder and committing every conceivable atrocity. In 1794 Pasvanoglu, one of the chiefs of the Krdzalis, established himself as an independent sovereign at Vidin, putting to flight three large Turkish armies which were despatched against him. This adventurer (d. 1807) possessed many remarkable qualities. He adorned Vidin with handsome buildings, maintained order, levied taxes and issued a separate coinage.

**The National Revival.**—At the beginning of the 19th century the existence of the Bulgarian race was almost unknown in Europe. Disheartened by ages of oppression, isolated from Christendom by their geographical position, and cowed by the proximity of Constantinople, the Bulgarians took no collective part in the insurrectionary movement which resulted in the liberation of Serbia and Greece. The Russian invasions of 1810 and 1828 only added to their sufferings, and great numbers of fugitives took refuge in Bessarabia, annexed by Russia under the Treaty of Bucharest. But the long-dormant national spirit now began to awake under the influence of a literary revival. The precursors of the movement were Paisii, a monk of Mount Athos, who wrote a history of the Bulgarian tsars and saints (1762), and Bishop Sofronii of Vratsa. After 1824 several works written in modern Bulgarian began to appear, and in 1835, the first Bulgarian school was founded at Gabrovo. Within ten years some 50 Bulgarian schools came into existence, and five Bulgarian printing-presses were at work. The literary movement led to a reaction against the influence and authority of the Greek clergy. The spiritual domination of the Greek patriarchate had tended more effectually than the temporal power of the Turks to the effacement of Bulgarian nationality. After the conquest of the Peninsula the Greek patriarch became the representative at the Sublime Porte of the *Rum-millet*, the Roman nation, in which all the Christian nationalities were comprised. The independent patriarchate of Trnovo was suppressed; that of Okhrida was subsequently Hellenized. The Phanariot clergy—unscrupulous, rapacious and corrupt—monopolized the higher ecclesiastical appointments and filled the parishes with Greek priests, whose schools, in which Greek was exclusively taught, were the only means of instruction open to the population. Greek became the language of the upper classes in all Bulgarian towns, the Bulgarian language was written in Greek characters, and the illiterate peasants, though speaking the vernacular, called themselves Greeks. The Slavonic liturgy was suppressed and in many places the old Bulgarian manuscripts, images, testaments and missals were burned. Thus although from 1828 onward sporadic military revolts had been led by Mamarčev, Rakovski, Panayot Khitov, Haji Dimitr and Stefan Karaja, these isolated Bulgarian patriots could not hope for success until the Greek ascendancy had been removed. For forty years the pioneers of Bulgarian nationality fought for the establishment of an autonomous church. At one time they even secured from the pope the appointment of an archbishop of the Uniate Bulgarian Church, causing Russia to urge the pope to grant Bulgaria's wishes; and on Feb. 28, 1870 a firman was issued establishing a Bulgarian Exarchate with jurisdiction over 15 dioceses, including Nish, Pirot and Veles. The first Exarch was elected in Feb. 1872. He and his followers were at once excommunicated by the patriarch; but Bulgaria was now free to develop her national feeling.

**The Revolt of 1876.**—Following on the rising of 1875 in Bosnia and the Hercegovina, a general revolt was organized in Bulgaria in 1876. It broke out prematurely in May in Koprivštitsa and Panagurište, and hardly spread beyond the sanjak of Philippopolis. It was repressed with fearful barbarity by Pomaks, bashi-bazouks and recently settled Circassians and Tatars. Some 15,000 Bulgarians were massacred near Philippopolis, including 5,000 men, women and children in Batak alone, and 58 villages

and five monasteries were destroyed. Isolated risings which took place on the northern side of the Balkans were crushed with similar barbarity. These atrocities were denounced by Gladstone in a celebrated pamphlet which aroused the indignation of Europe. The Great Powers remained inactive, but Serbia declared war in the following month, and her army was joined by 2,000 Bulgarian volunteers. Reforms proposed by a conference of the Powers held at Constantinople at the end of the year, were disregarded by the Porte, and in April 1877 Russia declared war (*see* RUSSO-TURKISH WARS, and PLEVNA). In the campaign which followed the Bulgarian volunteer contingent in the Russian Army accompanied Gourko's advance over the Balkans, behaved with great bravery at Stara Zagora, where it lost heavily, and rendered valuable services in the defence of Shipka.

**Independent Bulgaria. Treaties of San Stefano and Berlin.**—After advancing to Chatalja, Russia dictated the Treaty of San Stefano (Mar. 3, 1878) which realized almost all Bulgarian ambitions. An autonomous principality was created, the western frontier of which ran down from the Timok river to embrace Pirot, Vranje, Skoplie, Debar, Okhrida and Kastoria. Leaving Salonika and Chalcidice to Turkey, the frontier left the Aegean south-east of Xanthe and ran along the Rhodopes, passed north of Adrianople, curved down to include Lule-Burgas, and reached the Black sea north of Midia. The Dobruja was reserved as compensation to Rumania for Russia's annexation of Bessarabia. The area included in the new Bulgaria constituted three-fifths of the Balkan peninsula, with a population of 4,000,000 inhabitants. The Powers, however, fearing that this State would become practically a Russian dependency, intervened. The Treaty of Berlin, (*q.v.*), of July 13, 1878, reduced the principality of Bulgaria, (which was to be independent, but under the sovereignty of the Porte), to the territory between the Danube (excluding the Dobruja) and the rest of the Balkans, with Samokov and Kius-tendil. Vranje, Pirot and Nish were given to Serbia, Turkey retaining nearly all Macedonia. An autonomous province of Eastern Rumelia, subject to the sultan but with a Christian governor general, a diet and a militia, was created between the Balkans and the Rhodopes. A European commission was to draft a constitution for Rumelia; for Bulgaria, an assembly of notables was to meet at Trnovo within nine months, draw up an organic law and elect a prince; their choice was to be confirmed by the Porte with the assent of the Powers. The country was meanwhile occupied by Russian troops and administered by Russian officials.

**The Constitution of Trnovo and the Election of Prince Alexander.**—The Constituent Assembly, which met at Trnovo on Feb. 22, 1878, was overwhelmingly democratic in character. The majority of its members were peasants, and the Liberal party, under Tsankov, Karavelov and Slaveikov, easily predominated over the Conservatives. The constitution elaborated at this assembly (*see* section CONSTITUTION) was among the most democratic in Europe.

On Aug. 29, 1879 the first regular Bulgarian Assembly elected to the Bulgarian throne Prince Alexander of Battenberg, a member of the grand-ducal house of Hesse and nephew of the tsar Alexander II. of Russia. Prince Alexander arrived in Bulgaria and took the oath to the Constitution on June 26 amid general rejoicings; but from the first his position was difficult. Elected as Russia's candidate, and autocratic by nature and training, the young prince considered himself less a Bulgarian ruler than an agent for the foreign and domestic policy of his protector. Little else was, indeed, expected of him by the courts of Europe, but on both these scores he came into early conflict with the Bulgarian Liberals, now led by Stambulov, who commanded the bulk of Bulgarian public opinion and were strongly averse from any un-national policy, or any infringement of the democratic constitution. The prince first formed a Conservative ministry to take the place of the outgoing Russian officials, but was forced by the popular agitation to form a Liberal Government under Tsankov. As the Liberals, once in power, initiated a violent anti-foreign and anti-Russian agitation, the prince dismissed them, formed a new Conservative Government under the Russian general Ernroth, and charged him with arranging new elections to the Grand Sob-

ranje. The general obtained a subservient sobranje which agreed (July 13, 1881) to suspend the constitution and invest the prince with absolute powers for seven years. A period of dictatorship followed, under the Conservatives and the Russian generals Sobolev and Kaulbars, who were despatched from Russia to enhance the authority of the prince. His own adherents, however, disagreed among themselves over the question of railway concessions. The prince, whose relations with Russia had been less cordial since the death of Alexander II. in 1881, quarrelled with Sobolev, and began to favour Bulgarian aspirations. On Sept. 19, 1883 he restored the constitution by proclamation, and formed a coalition Government of Conservatives and moderate Liberals, which was succeeded on July 9, 1884 by a government of the Left-wing Liberals under Karavelov.

**Union with Eastern Rumelia and War with Serbia.**—In East Rumelia, as in Bulgaria, political life had brought forth a Conservative, or "Unionist," and a Liberal party. The differences between them were rather personal than of principle, for each was equally eager to promote the union with Bulgaria, but the Unionists, who were Russophil, had declared, in compliance with Russia's wishes, that the time was not yet ripe for the union. The Liberals, who were in opposition, seized the opportunity and on Sept. 18, 1885, having assured themselves beforehand of Prince Alexander's consent, they seized the governor-general, Krastović Pasha, and proclaimed the union. The prince arrived in Philippopolis a few days later, took over the government, and mobilized all available troops on the Turkish frontier to resist a possible attack. Turkey, however, beyond massing her troops on the frontier, made no move, but awaited developments in the international situation. The Western Powers showed Bulgaria sympathy, and Germany preserved a neutral attitude, but Russia, incensed by such independence of action, recalled her officers from the Bulgarian Army, and summoned conferences in Constantinople in September and October, where she urged that the union be cancelled and the sultan's authority restored in East Rumelia. This was opposed by Great Britain; and meanwhile King Milan of Serbia, declaring that the balance of power in the Balkans was endangered, suddenly declared war (Nov. 14, 1885). The Serbs advanced as far as Slivnitsa; but here they were met and brilliantly defeated by the untrained Bulgarian Army (Nov. 19) which pursued them over the frontier, took Pirot (Nov. 27), and was only stopped by the intervention of Austria (*see* SERBO-BULGARIAN WAR). Peace and the *status quo* were restored by the Treaty of Bucharest (March 3, 1886), and by the Convention of Top-Khané (April 5). Prince Alexander was appointed governor-general of East Rumelia, and the Rumelian administrative and military forces united with those of Bulgaria.

**The Abdication of Prince Alexander and the Regency.**—Discontent with these events impelled Russia to set afoot a conspiracy among the Russophiles in Bulgaria and certain discontented officers, who on Aug. 21, 1886 seized the prince in his palace, forced him to sign his abdication, and transported him out of the country. The country in general disapproved the plot; Stambulov, the president of the assembly, and Colonel Nutkurov, commandant of the troops at Philippopolis, initiated a counter-revolution, overthrew the conspirators and recalled the prince. The tsar, however, whom he had informed of his return, answered: "I cannot approve your return to Bulgaria." As no European Power would support him in face of Russia's ill-will, Alexander abdicated on Sept. 7, appointing as regents Stambulov, Karavelov and Nutkurov. The regency was successful, in difficult circumstances, in preserving order and securing the goodwill of Turkey. The election of a new prince was a more difficult task. Russia sent Gen. Kaulbars to Bulgaria to arrange for the election of the prince of Mingrelia; but finding fresh causes of discontent, broke off relations on Nov. 17. The Bulgarian delegates who toured the courts of Europe found the difficulty of selecting a prince who should be agreeable to Russia and to the rest of Europe alike, almost insurmountable. At last their offer was accepted by Prince Ferdinand of Saxe-Coburg-Gotha (*q.v.*).

**Prince Ferdinand.**—The new prince was elected by the Grand Sobranje on July 7, 1887, and took over the Government on July

14. His position was difficult, as Russia denounced him as a usurper and brought pressure on the Porte to declare his presence in Bulgaria illegal. Stambulov, who became minister president on Aug. 3, had to rule almost as a dictator in face of a raid led by the Russian captain Nabokov, a refusal by the bishops of the Holy Synod to pay homage to the prince, and a military conspiracy under Major Panitsa (1890). Fortunately Stambulov's foreign policy was very successful. The Powers withheld recognition; but Ferdinand was received personally in Vienna, London and Rome; and relations with Turkey became really cordial, the Porte granting the Bulgarian schools and Church valuable concessions in 1890, 1892 and 1894. While, however, Stambulov sought the friendship of the Porte, Ferdinand was anxious to recover the favour of Russia, and thus secure his own recognition. Relations between the two grew ever more strained, until Stambulov resigned in 1894. Under his successor, Dr. Stoilov, Ferdinand inaugurated a Russophil policy, which was facilitated by the death of the Tsar Alexander III. in Nov. 1894. The banished Russophiles and other victims of Stambulov's autocratic regime were amnestied; some of these murdered the great minister in the streets of Sofia on July 14, 1895. In the spring of 1893 Ferdinand had married Princess Marie Louise of Bourbon-Parma, Stambulov had persuaded the Grand Sobranje to alter the constitution and to allow the issue of the marriage to be brought up in the Roman Catholic faith. Now, however, he had his eldest son, Prince Boris, baptized into the Orthodox faith (Feb. 14, 1896), a step which, although it incurred the grave displeasure of Austria-Hungary, sealed the reconciliation with Russia. On March 14, the Powers having signified their assent, Ferdinand was nominated by the sultan prince of Bulgaria and governor-general of Eastern Rumelia. Russian influence again became predominant in Bulgaria. It was no longer conspicuous in her internal affairs, but a secret military convention was concluded in Dec. 1902.

**The Macedonian Question and the Declaration of Independence.**—The question which was now to dwarf all others in importance, and to sway all Bulgarian policy, was that of Macedonia. The narrow limits drawn by the Treaty of Berlin had left Bulgarians under foreign rule in Rumania, Serbia and Turkey. If the hope of recovering portions of the Dobruja and Western Serbia had prevented Bulgaria from initiating cordial relations with those two countries, she had recognized the impossibility of an aggressive war. With Turkey, however, matters were different. Macedonia constituted the largest Bulgaria irridenta; here the sense of Bulgarian nationality was especially strong and genuine; here, too, there was a fair possibility that the present masters would soon leave the field, and territorial acquisition prove possible. The Macedonian revolt of 1903 (*see* MACEDONIA) brought Bulgaria to the verge of war with Turkey; and despite a convention of April 8, 1904, she was obliged to keep up an army with a view to possible war, which, together with the maintenance of many destitute refugees from Macedonia, proved a heavy drain on her finances. Nor did the question end here. Other countries laid claim to Macedonia. Serbs, Greeks, Albanians, Vlachs, as well as Bulgars, carried on their rival propagandas by force of arms. Outrages committed by Greek bands in 1906 led to reprisals on the Greek population in Bulgaria, while with Serbia the situation was even more strained, especially since the return of the Karageorgević dynasty in 1903, the consequent increase in Serb propaganda in Macedonia and the increasing favour enjoyed by Serbia in Russia. It was partly, no doubt, the desire to set his country on an equality with Serbia, as well as the growing impatience of prince and people alike at the nominal vassalage to Turkey (even though the tribute imposed in 1878 was never paid) that decided Prince Ferdinand to proclaim Bulgarian independence. On visiting Vienna in Feb. 1908, Prince Ferdinand was well received; Bulgaria's aspirations towards the Dobruja and Nish made the conclusion of an alliance between her and Austria-Hungary impossible; but they were now in sympathy. After the Young Turk revolution of July 1908 an understanding was reached between Ferdinand and the Emperor Francis Joseph. Further pretexts were supplied by a diplomatic incident in Constantinople, and a strike in those sections of the

Eastern Rumelian railways which were owned by Turkey but leased to the Oriental Railways. On Oct. 5, 1908, the day after the Austrian annexation of Bosnia and the Hercegovina, Ferdinand proclaimed Bulgaria (including Eastern Rumelia) an independent kingdom. (J. D. B.; C. A. M.)

**The Balkan Alliance and the First Balkan War.**—The protests of Serbia against this action were stilled by Russia, who feared that Bulgaria might be driven definitively into the arms of Austria-Hungary. Bulgarian policy swung back into its old groove. Turkey had claimed an indemnity of £4,800,000 for the Declaration of Independence. Bulgaria had agreed to pay £1,520,000. In Feb. 1909 Russia undertook to advance the difference. A preliminary Russo-Turkish protocol was signed on March 16, and in April, after the final agreement had been signed, the independence of Bulgaria was recognized by the Powers.

In March 1911 the Malinov cabinet fell, and Guešov, head of the Nationalist party, became minister president. Negotiations for a Balkan alliance against Turkey commenced. The first, between Bulgaria and Greece, were conducted through J. D. Bourchier, Balkan correspondent of the London *Times*. A secret treaty of defensive alliance was signed between Bulgaria and Greece on May 29, 1912. The Serbo-Bulgar treaty was signed in Sofia on March 13, and supplemented by the secret military conventions of Varna, May 12 and July 12. Bulgaria had desired autonomy for Macedonia; Serbia, its division into uncontested Bulgar and Serb zones, and a third zone on which the tsar of Russia was to arbitrate. Ultimately Serbia recognized "the right of Bulgaria to the territory east of the Rhodope mountains and the river Struma"; while Bulgaria recognized "a similar right of Serbia to the territory north and west of the Sar mountains"; if autonomy for the rest of Macedonia proved impossible, an agreed line from Golem Mountain to Okhrida was to be accepted, subject to the tsar's approval. Hartwig, the Russian minister at Belgrade, had kept his government informed throughout. Early action was necessary in view of the approaching end of the Italo-Turkish War and the unrest in Macedonia. The Great Powers endeavoured to prevent war by the tardy offer of a guarantee for the autonomy of Macedonia. The Balkan Allies mobilized on Sept. 30. On Oct. 8, Montenegro, with which country no formal agreement had been made, declared war on Turkey. On Oct. 13 the Balkan Allies sent an ultimatum to the Porte; on Oct. 18 Greece declared war on Turkey.

The successes of the Balkan Allies were swift, although the casualties of Bulgaria, especially, were heavy. On Dec. 3 an armistice was signed between Turkey, Bulgaria and Serbia. A conference met in London to decide terms of peace, but negotiations broke down over the possession of Adrianople. On Feb. 3, 1913, hostilities reopened. Again the allies were everywhere successful, and after the surrender of Adrianople to the Bulgars and Serbs (March 26) the Turks sought the mediation of the Powers, and a second armistice was concluded between Bulgaria and Turkey on April 16. On May 30 1913 the delegates to the second London Conference were induced to sign a treaty, the terms of which had been drafted by the Powers. Turkey surrendered to the allies all her possessions in Europe up to a line drawn from Enos on the Aegean to Midia on the Black sea. Albania was granted independence. (*See* BALKAN WARS.)

**The Second Balkan War.**—Difficulties immediately arose as to the interpretation of the treaty. The Serbs claimed that, after the unforeseen success of the campaigns and the modification by the Powers of the arrangements on the Adriatic coast, a revision of the treaty was necessary, while the Bulgars held out for the letter of the territorial agreement. The secret annexes (March 13, 1912) stated that "all territorial gains acquired by combined action . . . shall constitute the common property (*condominium*) of the two allies" until final settlement. The Serbs and Greeks, as a result of their victories, held much territory in Macedonia that had originally been assigned to Bulgaria, and they seemed to be preparing for a permanent occupation. Early in 1913 Bulgaria began to suspect that her allies were combining against her, and the military party, with King Ferdinand at their head, prepared for action.

On June 1 Guešov and Pašić met in the hope of averting war; on the same day a treaty between Serbia and Greece was signed at Salonika. Guešov, finding no support from King Ferdinand in his efforts for peace, resigned; he was succeeded by Danev. On June 29 the Bulgarian 4th Army, acting on orders signed by Gen. Savov, made a treacherous attack on their Serbian and Greek allies. It must, however, be remembered that the attack was not unexpected, and that it probably only just forestalled a declaration of war by Serbia and Greece. Guešov states in his memoirs that the reports of the Ministerial council contain no minute ordering the attack. A judicial inquiry into the case was opened in Sofia, but never concluded. Savov asserted that Ferdinand as commander-in-chief gave the order to attack.

The Second Balkan War brought calamity on both Bulgaria and Macedonia. By the Treaty of Bucharest (Aug. 10, 1913) Rumania acquired the rich lands of the Southern Dobruja, which had belonged to Bulgaria since 1878; Serbia and Greece divided Macedonia between them; Bulgaria was accorded the mountainous region of the Pirin and Dospat down to the Aegean, with the two indifferent ports of Dedeagatch and Port Lagos.

**Rapprochement with the Central Powers.**—The Radoslavov Government which took office in July 1913, abandoned the Russophil policy which had given Macedonia to Serbia. When France, Britain and Russia refused to grant a loan to meet obligations and for constructive work, they turned to the Central Powers, and in July 1914 concluded a loan of 500,000,000 leva with the Disconto-Gesellschaft of Berlin, the group obtaining control of the Bulgarian State coal mines, the port of Lagos, and the projected railway to it. Negotiations for a treaty had been going on simultaneously, and in August were approaching completion (*see EUROPE*); and thus, when the World War broke out, although most Bulgars wished to preserve neutrality, the pro-German sympathies of the king, who also believed Germany invincible, were reinforced by a widespread feeling that the Central Powers, and they alone, might yet gain Macedonia for Bulgaria. The efforts made by the Entente through the summer of 1915 to win over Bulgaria were frustrated by the refusals of Serbia and Greece to cede territory. On Sept. 6 Bulgaria signed a military convention and treaty with the Central Powers at Pless (Pszczyna), and Turkey made the concessions demanded by Bulgaria. On Sept. 15 the Entente promised Bulgaria part of Macedonia unconditionally, if she would declare war on Turkey. The Opposition protested vehemently against the king's policy, Stambolisky being, in consequence, condemned to imprisonment for life for *lèse-majesté*, but mobilization was decreed on Sept. 22, and Bulgaria declared war on Serbia on Oct. 12. Great Britain, France and Italy declared war on Bulgaria on Oct. 15, 16 and 17 respectively.

**The World War, 1915-18, and the Treaty of Neuilly.**—The initial successes of the Bulgarian troops in Serbia, and later in the Dobruja, gave some popularity to the war; but the Opposition continued to urge retirement from the War, especially when her national objectives, Macedonia and the Dobruja were attained. Southern Dobruja passed to her, with immediate occupation, under the Treaty of Bucharest, May 7, 1918; but shortage of food and munitions, exhaustion, and the hopes raised by President Wilson's pronouncement of the Fourteen Points, intensified the desire for a separate peace. Malinov replaced Radoslavov in office on June 18, and when the Bulgarian line was broken and the country invaded (Sept. 15-27), he asked for an armistice, which was signed unconditionally on Sept. 29. Stambolisky, who had been released on Sept. 25 and sent to the front to calm the troops,

proclaimed a republic and advanced on Sofia; order was restored by loyal troops with German assistance, after some fighting. On Oct. 3 King Ferdinand abdicated in favour of his son Boris and left the country. Under the Treaty of Neuilly (*q.v.*) Bulgaria was disarmed, condemned to a heavy indemnity, and lost the Southern Dobruja to Rumania, Caribrod and Strumica to Yugoslavia, her recent gains in Macedonia to Greece, and her Aegean coastline to the Allies and Associated Powers, who assigned it to Greece at the Conference of San Remo (April 1920, *q.v.*).

**The Agrarian Government, 1920-23.**—Post war revolutionary feeling in Bulgaria took the form of a reaction against her war policy. Stambolisky, its most courageous opponent, was the hero of the hour. The elections of March 28, 1920 gave the Agrarians an absolute majority, and Stambolisky, as premier of an Agrarian cabinet, opened a campaign against the bourgeoisie which in its methods closely resembled that of the Russian Bolsheviks, with whom he later opened up direct communications; he was also the author of a plan for a "Green international" of peasants. He used the Communists of Bulgaria as allies against the bourgeoisie, but denounced and persecuted them as enemies of property. His valuable measures, which were not repealed after his fall, were an agrarian law whereby Crown and Church lands and property over a certain size (30 hectares for peasant proprietors, ten for married, four for single urban proprietors who did not themselves cultivate the soil) were expropriated in favour of landless peasants; and the institution of a year's obligatory State service.

Stambolisky's foreign policy was sensible and conciliatory. He attempted to live on peaceful terms with his neighbours and to fulfil treaty obligations. Despite grave economic difficulties, Bulgaria commenced payment of the reparations, the total of which was finally reduced from £90,000,000 to £22,000,000, payable over 60 years. Despite this, Bulgaria failed at the two conferences of Lausanne to secure an adequate fulfilment of clause 48 of the Treaty of Neuilly, which guaranteed her an issue to the Aegean (*see THRACE*), and her relations with her neighbours were left in a state of tension by the question of the Bulgarian minorities in Thrace, Dobruja and Macedonia.

**The Refugee Question.**—The Treaties of Bucharest (1913) and Neuilly had left large numbers of Bulgars under foreign rule, which was in most cases extremely harsh and unjust. While those who remained in their homes complained of oppression, large numbers took refuge in Bulgaria, while others were brought in under the exchange of population scheme with Greece. Since 1918 alone 260,000 refugees had entered Bulgaria, mostly from Macedonia and Thrace; and most of these were landless, destitute, and resentful, while the Bulgarian State, with its shattered finances, could do little to relieve their miseries. A large proportion of the population of Bulgaria, refugee or otherwise, was of Macedonian origin, and the powerful and ruthless Internal Organization of the Macedonians, under their capable and terrible leader, Todor Alexandrov (*q.v.*), gained general sympathy in its fight for Macedonian autonomy, and thus formed an underground factor of the first importance in Bulgarian politics. While the Bulgarian delegates to the League of Nations (which Bulgaria joined on Dec. 16, 1920) voiced at every opportunity the grievances of the Bulgarian minorities in Macedonia, Thrace and the Dobruja, the refugee organizations, particularly the Macedonians, raided the territory of Bulgaria's neighbours from their fastnesses in the Bulgarian mountains, and thus helped to perpetuate a state of discord between Bulgaria and her neighbours. The Bulgarian Government was not the least of the sufferers from the situation; and an agreement concluded by Stambolisky with the Yugoslav Government at Nish (March 1923) was believed to contain a clause directed against the Macedonian Committee. Upon this the Macedonians combined with the Bulgarian Nationalists and those of the officers and bourgeoisie who had suffered most from Stambolisky's arbitrary rule. A *coup-d'état* in the night of June 8/9, 1923, overthrew the Agrarian Government. Stambolisky was killed, most of his ministers imprisoned, and his Orange Guards dispersed.

BULGARIAN PEASANT BRINGING MILK TO THE MARKET

**The Tsankov Government, 1923-25.**—Professor Tsankov now took office at the head of a government subsequently strengthened by the fusion of all political parties, except the Liberals, Communists and Agrarians, into the single "Democratic Entente." For some time Bulgaria was on the verge of civil war. The Agrarian refugees migrated in large numbers to Yugoslavia, where the Government gave them shelter, and allied themselves with the Communists, who with support from Moscow, attempted to bring about a revolution. Tsankov repressed these movements with great severity. In September several thousand persons were killed, and others imprisoned for long periods without trial. Meanwhile the *Comitadj* warfare on the frontier continued. Relations with Greece, especially, became particularly difficult on account of the severe reprisals taken by that country for an attempted rising in the Maritsa valley in 1923, and an incident at Tarlis on July 26/27, 1924, where a Greek post arrested 70 Bulgars and murdered several of their prisoners. A protocol signed at Geneva between Greece and Bulgaria, on Sept. 29, 1924, which had promised a settlement, was repudiated by Greece at the instance of Yugoslavia. Meanwhile acute dissensions broke out within the Macedonian organization itself, one group of which wanted autonomy for Macedonia, the other a federative scheme. There was a further disagreement as to how far the help of Moscow ought to be accepted. On Aug. 31, 1924 Alexandrov was murdered, and the subsequent reprisals deprived the organization of most of its coherence and moral justification. The Agraro-Communist agitation, too, continued unabated. There were some 200 assassinations in 1924; on April 14, 1925 an attempt was made on the life of King Boris, and General Gheorghiev was killed the next day. At his funeral, which was held on April 16 in the cathedral of Sveta Nedelia, Sofia, a bomb was exploded killing 123 persons and wounding 323. The Government proclaimed martial law. Five persons were later hanged publicly for the crime, but a large number were either shot summarily or imprisoned. To maintain order, the Government obtained the permission of the Conference of Ambassadors for a temporary increase in its armed forces of 10,000 men; and in fact, its extreme energy prevented any general rising. The Tsankov Government also successfully survived a fresh frontier incident with Greece, which occurred on Oct. 19, when Greek troops occupied 70 square miles of Bulgarian territory near Petritsch. The matter was settled by the League of Nations (*q.v.*) on appeal from Bulgaria. The repressive measures which Tsankov had felt obliged to take had, however, been more fitted for emergencies than for ordinary times, and as the Agraro-Communist agitation seemed much sobered by the dreadful events of the spring of 1925, Tsankov resigned on Jan. 2, 1926 in favour of a more conciliatory government under Liapchev, a leader of the Democratic party. On Feb. 4 the Liapchev Government promulgated an amnesty for political offenders, which affected 6,325 persons.

**The Liapchev Government and the Refugee Loan.**—The effects of this change were most beneficial. The Agrarians were allowed to reconstitute their party in Bulgaria, and the 2,000 or so emigrés who remained in Yugoslavia soon lost credit. The Social Democrats were less fortunate, but even here hostility gradually grew less as Moscow ceased to finance the extreme Communists so liberally.

On June 11, 1926, the Council of the League of Nations decided that the state of Bulgaria warranted the grant of a loan, for which application had first been made 18 months previously, for the settlement of the destitute Bulgarian refugees. The question was of supreme importance for Bulgaria, both financially and politically, for it was from among these refugees, with whom the whole population sympathized, that the *comitadjis* were re-

cruited, whose incessant frontier raids so troubled Bulgaria's relations with her neighbours. Following the decision of the League, the Bank of England on Aug. 26 advanced £400,000 for immediate work, which was at once set on foot. An arrangement with the bond-holders of Bulgaria's pre-War debt was signed on Dec. 11 and the loan, for £2,400,000 nominal in England and \$4,500,000 in the United States of America, was floated very successfully on Dec. 26. Bulgaria's neighbours had shown an unjustifiable apprehension regarding the application of the Loan funds, and had made fresh outbursts of *comitadj* activity in the summer of 1926 the occasion of a joint note to the Bulgarian Government demanding the dissolution of the revolutionary organizations (Aug. 27). This was, indeed, more easy to demand than to fulfil; but there seemed little doubt that Liapchev's Government was sincerely anxious to restrain the Macedonian and other committees. Bulgaria had been politically almost isolated for more than a decade; a treaty of friendship signed with Turkey on Oct. 18, 1925 was no compensation for continual tension with Yugoslavia, Greece and Rumania. Yet even here there were signs of an improvement, especially after the Treaty of Tirana between Italy and Albania (*see* ALBANIA), concluded on Nov. 27, 1926, revived in Yugoslavia the old feeling of Balkan solidarity. The time for a real rapprochement was not yet come, especially as whenever relations between Bulgaria and Yugoslavia grew cordial, the Macedonians proceeded to fresh outrages; those of Sept. 1927, when a bomb was exploded in a hotel at Ghevgheli, a train blown up near the same town, and the Serb general Kovačević murdered, were particularly shocking. The exchange of populations was, however, gradually decreasing the causes of friction, and making Bulgaria's aspirations for a recovery of her lost territory more impracticable. It remained for Bulgaria's more fortunate neighbours to show a justice tempered with generosity, and Bulgaria, a cheerful resignation to her hard fate.

**BULGARIA, EASTERN**, formerly a powerful kingdom which existed from the 5th to the 15th century on the middle Volga, in the present territory of the provinces of Samara, Simbirsk, Saratov and North Astrakhan, perhaps extending also into Perm. The village Bolgari near Kanzañ, surrounded by numerous graves in which most interesting archaeological finds have been made, occupies the site of one of the cities—perhaps the capital—of that extinct kingdom. The history, *Tarikh Bulgar*, said to have been written in the 12th century by an Arabian cadi of the city

BULGARIAN PEASANT GIRL WEARING HER HAIR BRAIDED AND ORNAMENTED WITH COINS

Bolgari, has not yet been discovered; but the Arabian historians, Ibn Foslan, Ibn Haukal, Abul Hamid Andalusí, Abu Abdallah Harnati, and several others, who had visited the kingdom, beginning with the 10th century, have left descriptions of it. The Bulgars of the Volga were of Turkish origin, but may have assimilated Finnish and, later, Slavonian elements. In the 5th century they attacked the Russians in the Black sea prairies, and afterwards made raids upon the Greeks. In 922, when they were converted to Islam, Ibn Foslan found them not quite nomadic, and already having some permanent settlements and houses in wood. Stone houses were built soon after that by Arabian architects. Ibn Dasta found amongst them agriculture besides cattle breeding. Trade with Persia and India, as also with the Khazars and the Russians, and undoubtedly with Biarmia (Urals), was, however, their chief occupation, their main riches being furs, leather, wool, nuts, wax and so on. After their conversion to Islam they began building forts, several of which are mentioned in Russian annals. Their chief town, Bolgari or Velikij Gorod (Great Town) of the Russian annals, was often raided by the Russians. In the 13th century it was conquered by the Mongols, and became for a time the seat of the khans of the Golden Horde. In the 15th century Bolgari became part of the Kazañ kingdom and was annexed to Russia after the fall of Kazañ. (P. A. K.)

**BULGARIAN LANGUAGE:** see SLAVONIC LANGUAGES and OLD SLAVONIC.

**BULGARIAN LITERATURE.** Literature, in the sense of free artistic creation, dates in Bulgaria from the second half of the 19th century. During the first half of the 19th century and part of the second half, a considerable number of writers and publicists devoted their lives and their works to the ideal of national re-birth. Of these, four stand out, in virtue of the quality of their literary work, of their practical activities, and of the importance of their achievements, which far transcended the narrow bounds of their time. Both as poets and as publicists, they laid the foundations of Bulgaria's national life, and later, after the liberation of Bulgaria, they became figures of popular veneration. These four men were G. S. Rakovski, L. Karavelov, G. Botev (*q.v.*) and P. R. Slaveikov.

The influence of the social and political conditions of their day, with its absence of any personal or national liberty, combined with that of certain Russian ideological tendencies, taught these writers to believe that literature should be subordinated and adapted to the needs of social life. Thus their poems and dramas, with very few exceptions, attack a definite social problem. Their inner lives and the technique of their poetical work were, for them, of secondary importance.

Karavelov laid the foundations of Bulgarian narrative prose. His genius created types which have excited the admiration of readers from the Liberation down to the present day, and are still imitated by later writers. Botev, one of the most brilliant of Bulgarian poets, set the Bulgarian nation the example of the most sublime devotion in the name of love of liberty and of his native soil. Of all the Bulgarian poets ("bards"), it was he who produced the best and the most fiery revolutionary songs; of all the revolutionary poets he accomplished the most noble and glorious feat: at the head of an armed band he crossed the Danube, after seizing the Austrian ship "Radetzky"; then he marched to the mountains of Vratsa to die there fighting against Turkish troops.

P. R. Slaveikov enriched Bulgarian literature with the treasures of national poetry, whose wealth he first revealed. His works were based on popular tradition and folk-lore. He was the father of the Bulgarian epic.

The liberation of Bulgaria in 1878 undoubtedly altered political and social conditions, and created an atmosphere infinitely more favourable to literary production than the era of Turkish domination had afforded. Towards the end of the second half of the century, Bulgaria had achieved complete stability as a State. At this time the country contained a considerable intellectual class, fitted for special work in every branch of intellectual and political life. Writers felt themselves released from their former duty of keeping literature the handmaid of civic training; they began to devote themselves to pure poetic meditation.

**The Work of Vasov.**—Ivan Vasov is the most typical, most popular and most productive of the Bulgarian writers who by their lives and works linked together the two epochs which respectively preceded and followed the revolution. He is known far beyond the frontiers of Bulgaria. His best novel, *Under the Yoke*, has been translated into almost every European language. During 50 years of literary activity (he lived 72 years, 1850–1922), Vasov excelled in every branch of literature. His immense output reflects every aspect of his nation's life. From his first poem *The Pine*, which appeared in 1870, a few years before the Liberation, down to his last collection of verse, *My Lilac's Fragrance*, which appeared in 1920, Vasov's lyrics are made up of an infinite variety of tones; echoes of the sorrows and the joys of a people's soul. Vasov hardly lived a life of his own. He feels his personality melt in the collective griefs and life of his nation. Thus social aspiration is an essential and characteristic feature of his lyric poetry. Vasov's epic work—stories, poems, sketches, novels—is immense in quantity and embraces Bulgarian national life in all its manifestations and in every age. His most characteristic novels, which show both his literary qualities and his creative tendencies, are *Under the Yoke*, *New Land* and *The Queen of Kazalar*. The subject matter of these novels represents the three most important moments in the history of the Bulgarian people's political and spiritual life. *Under the Yoke* gives us a vivid, attractive and impressive picture of the struggle of the Bulgars against the Turk. The principal hero of the novel is an intellectual and revolutionary, who devotes his life to the supreme end of lighting the torch of insurrection in the soul of the people. *Under the Yoke* is both a work of art and a faithful picture of the political situation, of social and family life, in Bulgaria at the most decisive moment of its history. Vasov's second and third novels, which are considered his best, thus illustrate the three successive stages of modern Bulgarian history. The few details of Bulgarian life not depicted in them are represented in his numerous short stories, poems and sketches. Vasov understood, however, that the aim which he had set himself, of reproducing a picture of Bulgarian life in its entirety, could not be achieved if he confined his writings to modern times. He therefore delved into tradition and resurrected the past of Bulgaria, before the coming of the Turk, in a series of dramas. While his primary aim was to present all Bulgarian history in his dramas, he set himself at the same time to teach the present a lesson through the past. Throughout his work, Vasov pursued the practical goal of showing a moral, social and national example. In this respect he maintained the tradition of national poetry bequeathed by the age which preceded the Liberation. The best known of his dramas are *Towards the Abyss*, *Borisslav* and *Yvailo*.

S. Michailovsky, who died in 1927, was Vasov's contemporary and spiritual brother. Without equalling the other's versatile genius or his imaginative power, Michailovsky was yet distinguished by remarkable insight, depth and wealth of thought, through which he expressed the ambitions of his ardent nature. He was Vasov's spiritual brother in so far as he, too, if in a different literary manner, devoted his talents to raising Bulgaria's spiritual life. Michailovsky in his satires scourged vice to show nobility and virtue rising triumphant. Educated in France, he was master of the subtleties of French literature and philosophy. His knowledge of French 17th and 18th century rationalism may have influenced his mind, which was often troubled by doubt. Towards the end of his life, this led to a Christian mysticism. His lay sermons are the product of this latest phase. Among his most important works are *Novissima Verba*, *The Book of the Bulgarian People*, and *To-day Hammer, To-morrow Anvil*. Among the other notable contemporaries of Vasov and Michailovsky may be mentioned Aleko Constantinov, author of a well-known and most humorous work, *Bai Gagno*, depicting the typical Bulgarian peasant, and Constantine Velitchkov, who, through his translations of Dante, Petrarch, Silvio Pellico and others, opened up to the intellectual world of Bulgaria the wealth of Latin and Italian poetry.

**An Artistic Revival.**—As was said above, from the '90s of the past century, Bulgarian literature shows two tendencies. First

we have writers like Vasov, who have their roots in the literary tendencies of the pre-Liberation period; then the younger school, inspired by a burning desire to make a clean sweep of this slavery, to create work unencumbered by any moral, political or social tendencies. In the short story, Anton Strachimirov, P. U. Todorov, G. Stamatov and Eline-Peline have attained considerable success. Strachimirov studies the intimate life of certain social groups (artisans and peasants), analyses their relations to social evolution as a whole, and thus shows us persons leading a more or less individual life with their daily cares and daily joys. This writer later began to work on a broader scale, and gave us some novels which are considered, and rightly, to be among the better contemporary Bulgarian works. The national catastrophe resulting from the World War brought a certain disarray into his fiery soul, which was evidenced by the hurried novels which he produced after it. A. Strachimirov also produced several dramas which showed incontestable artistic qualities. The best known of his works are: *Autumn Days*, *A Meeting*, *Mother-in-Law*, *Beyond* and *The Vampire*. Eline-Peline has chosen to display his talents in a still narrower field: that of peasant life. He shows us characters which are at the same time true to life and softened by their creator's deep love for them. His latest work, which is of indisputable importance, is his story *The Earth*; both in subject and treatment this work is more local than universal. In his later period Eline-Peline has written chiefly children's songs and stories. He is considered to-day the most popular writer in this field. P. U. Todorov is at once the originator and the master of the Bulgarian short idyll. He borrowed his subjects from popular legends, but made them turn round psychological and human conflicts of interest to all. He also wrote numerous charming symbolical dramas, which were based on ancient, popular myths. Apart from the delicacy of his poetic touch, the chief characteristic of his work is his feeling for harmony and rhythm. He died young, before his talent had fully developed. His chief works are: *Idylls* (collected), *The Dragon's Marriage* and *The First*. Georgi Stamatov is an original psychologist and a realist with clearly marked leanings towards naturalism. In his numerous short stories he exposes vice with unusual power. The problem of sex occupies his mind particularly. His style charms us by an indefinable quality which ranges from light humour to the most biting irony. The first aim of these four writers in their artistic output was to express, above all things, truth and pure "poetry"—pure, that is, and unencumbered by any extraneous matter. This is the particular quality which distinguished them from Vasov. In lyric poetry, Pentcho Slaveikov, son of the P. R. Slaveikov mentioned above, set out to conquer the Liberation—spiritually speaking—by works of the most perfect technique. Some years before his death in 1912 foreign admirers were already considering his work with a view to the possible award of the Nobel prize. His poems are works of art sublimely woven on a canvas either profoundly national or simply human (see his *Ralitsa* and his *Boiko*), or universal moral conflicts, as *Chelli*, *Symphonies of Despair*, *Consoled*, etc. His greatest work, which achieves a degree of magic unapproached in Bulgarian literature, is his poem called *A Song of Blood*. This is the artistic expression of the most dramatic moment in Bulgarian history. Slaveikov is the first and the most powerful of the Bulgarian poets who in their poetry have truly followed a path emancipated from any influence of social tendencies. He was neither directly lyrical to an exaggerated degree nor exclusively individualist. His themes are always treated with a feeling as deep as it is fanatical for poetry and beauty, whether they are drawn from the eternal problems which perplex the human soul, or whether they spring from those born of national life. Slaveikov died in Italy in 1912. His chief works are: *Dream of Happiness*, *In the Island of the Blessed*, *Epic Songs* and *A Song of Blood*.

**Poetry of the New Age.**—P. K. Yavorov, one of the most brilliant Bulgarian lyric poets, was a younger contemporary of Slaveikov. His eyes remained fixed for ever on the life of his own soul, where the purest, but also the most violent, emotions mingled, giving birth to sublime suffering. The increasing intensity of his spiritual development can be clearly traced in his work. He began with humanitarian pity of his fellow-men to end in stormy and

proud solitude. In 1902, at the moment when his great popularity had been sealed by solemn critical appreciation, Yavorov, like Botev, to whom he shows close affinities, bore his distracted dreams to the mountains of Macedonia, to sacrifice his work, his thoughts and his emotions on the altar of the Macedonian revolutionary movement. The wealth of his lyric motifs, the depth of his feeling, the sincerity and moving force of his expression make him the lyricist of the new age, and also its best loved poet. In a mystic longing towards union beyond the grave with the soul of her who, first in life, and then in death, drew him irresistibly to her, Yavorov ended his life at the beginning of 1914. His chief works are: *Poems*, *Waking Nights*, and *In the Shadow of the Clouds*; *At the Foot of Vitos* and *When the Thunder Growls* (dramas) and *A Heyduk's Hopes* (sketches of comitadji life). Cyril Christoc, a contemporary of Slaveikov, is a lyric poet who, owing to a weak heart, has been forced to live outside Bulgaria. He is master of sentimental, light and frivolous verse. The glorification of gay and careless life sings through his rhymes. His style is technically admirable for its suppleness, its vivacity and its lightness. His works include *Shadows of the Evening*, *Vibrations*, *Songs and Sighs*, etc. In more recent times a great number of writers and poets have been working with enthusiasm in the fields of lyric poetry, the short story and the novel, and revealing not only a new sense of literature, but also new forms. To-day the doors have been thrown wide open to the influence of the literatures of Western Europe. This influence is particularly apparent in the work of some of the younger lyric poets of Bulgaria. Under it a special school of the lyric has been developed with success by Nicolai Liliev, Todor Trainavov, Dimtcho Debelianov and Ludmil Stoyanov. Since about 1915 or 1920 these four poets, each with his particular qualities and potentialities, have represented the advance-guard of Bulgarian poetry. The work of this group of lyricists is marked by a purely individual sensibility, which sometimes gives rise to awkward and bizarre forms, new colours, new assonances and new groupings of words in the verse, new rhyme-schemes, and in general, new motifs, in opposition to the tradition.

In the work of two young Bulgarian women, Dora Gabe and Elisabeth Beltcheva, we find simplicity in the artistic sense of the word; that is to say, an absence of any searching or straining after artificial importance in choice of subject; originality in form; limpidity and sincerity pushed to the point of candour. A whole group of young poets, among whom we may mention Stoubel, Pantaleyev, Raztvetnicov and others, are following in the footsteps of the writers whom we have already mentioned. Among the most talented writers of fiction, we should mention Jordan Yovcov, Dobre Nemirov, Georgi Ratchev, Nicolai Rainov and C. Constantinov. Rainov is a visionary by nature, and his work shows leanings toward mystic fantasy, and Ratchev sketches for choice the rare mental situations, which give his tales a naturalistic and sardonic character; the other three pursue a path of artistic realism. They portray scenes drawn from simple everyday life. Of the very young prose writers whose talent is undeniable, we should mention A. Karailyatchev and V. Polianov. (J. Br.)

**BULGARUS**, an Italian jurist of the 12th century, born at Bologna. He was sometimes erroneously called Bulgarinus, which was properly the name of a jurist of the 15th century. He was the most celebrated of the famous "Four Doctors" of the law school of the University of Bologna, and was regarded as the Chrysostom of the gloss-writers, being frequently designated by the title of the "Golden Mouth." He died in A.D. 1166, at a very advanced age. Martinus Gosia and Bulgarus were the chiefs of two opposite schools at Bologna, corresponding in many respects to the Proculians and Sabinians of imperial Rome, Martinus being at the head of a school which accommodated the law to what his opponents styled the equity of "the purse" (*aequitas bursalis*), while Bulgarus adhered more closely to the letter of the law. The school of Bulgarus ultimately prevailed, and it numbered among its adherents Joannes Bassianus, Azo and Accursius, each of whom in his turn exercised a commanding influence over the course of legal studies at Bologna. Bulgarus took the leading part among the Four Doctors at the Diet of Roncaglia in 1158 and was one of the most trusted advisers of the Emperor Fred-

erick I. His most celebrated work is his commentary *De Regulis Iuris*, which was at one time printed among the writings of Placentius, but has been properly reassigned to its true author by Cujacius, upon the internal evidence contained in the additions annexed to it, which are undoubtedly from the pen of Placentius.

**BULL, GEORGE** (1634–1710), English divine, was born at Wells and educated at Tiverton school and Exeter college, Oxford. He had to leave Oxford in 1649 as he refused to take the oath of allegiance to the Commonwealth. He was ordained privately by Bishop Skinner in 1655, and, after holding various preferments, became in 1705 bishop of St. David's. During the time of the Commonwealth he adhered to the forms of the Church of England, and under James II. preached strenuously against Roman Catholicism. His *Defensio Fidei Nicenae* (1685) tries to show that the doctrine of the Trinity was held by the ante-Nicene fathers of the church, and retains its value as a thorough-going examination of all the pertinent passages in early church literature. His other works include: *Harmonia Apostolica* (1670), *Judicium Ecclesiae Catholicae* (1694), and *Primitiva et Apostolica Traditio* (1710).

The best edition of Bull's works is that in 7 vols. published at Oxford by the Clarendon Press, under the superintendence of E. Burton, in 1827. This contains the *Life* by Robert Nelson. The *Harmonia*, *Defensio* and *Judicium* are translated in the Library of Anglo-Catholic Theology (1842–55).

**BULL, JOHN** (c. 1562–1628), English composer and organist, was born of a Somersetshire family about 1562. After being organist in Hereford cathedral, he joined the Chapel Royal in 1585 and in the next year became a Mus. Bac. of Oxford. In 1591 he was appointed organist in Queen Elizabeth's chapel in succession to Blitheman, from whom he had received his musical education. In 1592 he received the degree of doctor of music at Cambridge university; and in 1596 he was made music professor at Gresham college, London. As he was unable to lecture in Latin according to the foundation-rules of that college, the executors of Sir Thomas Gresham made a dispensation in his favour by permitting him to lecture in English. In 1601 Bull went abroad. He visited France and Germany, and was everywhere received with the respect due to his talents. Anthony Wood tells an impossible story of how at St. Omer Bull performed the feat of adding, within a few hours, forty parts to a composition already written in forty parts. Honourable employments were offered to him by various continental princes; but he declined them, and returned to England, where he was given the freedom of the Merchant Taylors' Company in 1606. He played upon a small pair of organs before King James I. on July 16, 1607, in the hall of the company, and he seems to have been appointed one of the king's organists in that year. In the same year he resigned his Gresham professorship, and married Elizabeth Walter. In 1613 he again went to the continent on account of his health, obtaining a post as one of the organists in the archduke's chapel at Brussels. In 1617 he was appointed organist to the cathedral of Notre Dame at Antwerp, and he died in that city on March 12, 1628. Little of his music has been published, and the opinions of critics differ much as to its merits (see Dr. Willibald Nagel's *Geschichte der Musik in England*, ii. (1897), p. 155, etc., and Dr. Seiffert's *Geschichte der Klaviermusik* (1899), p. 54 etc.). Contemporary writers speak in the highest terms of Bull's skill as a performer on the organ and the virginals, and there is no doubt that he contributed much to the development of harpsichord music. Jan Sweelinck (1562–1621), the great organist of Amsterdam, did not regard his work on composition as complete without placing in it a canon by John Bull. For the ascription to Bull of the British national anthem, see NATIONAL ANTHEMS.

Most of John Bull's work which has been preserved is still in ms., but some of his compositions appear in Leighton's *Tears or Lamentations* (1614), and in the *Fitzwilliam Virginal Book* (Breitkopf and Härtel, Leipzig, 1899).

**BULL, JOHN:** see JOHN BULL.

**BULL, OLE BORNEMANN** (1810–1880), Norwegian violinist, was born in Bergen, Norway, on Feb. 5, 1810. He was sent to Christiania (now Oslo) to study theology, but his time was given instead to music and to political agitation. In 1829 he

went to Cassel, on a visit to Spohr, who, however, gave him no encouragement. After a brief period of study at Göttingen and a visit to Norway during which he played at many concerts, he went to Paris. There he heard Paganini play and began a course of hard work in the hope of rivalling his virtuosity. Although he had been largely self-taught he acquired a wonderful technique and speedily achieved world-wide fame by his brilliant playing of his own pieces and arrangements. His first visit to the United States lasted from 1843 to 1845, and on his return to Norway he formed a scheme for the establishment of a Norse theatre in Bergen. This became an accomplished fact in 1850; but in consequence of harassing business complications he went again to America. During this visit (1852–57) he bought 125,000 acres in Potter county (Penn.), for a Norwegian colony, which was to have been called Oleana after his name, but his title turned out to be faulty and the troubles which resulted seriously affected his health. He died at Lysø, near Bergen, on August 17, 1880. Ole Bull never sought to play serious music, but he delighted all hearers by his brilliant rendering of the virtuoso works in which he excelled and also by his expressive playing of national airs.

See Sarah E. Bull, *Ole Bull, a Memoir* (1886).

**BULL.** (1) The male of animals belonging to the section *Bovina* of the family *Bovidae* (q.v.), particularly the uncastrated male of the domestic ox. (See CATTLE.) The word is also used of the males of other large animals such as the elephant, whale, etc. The O.E. diminutive form *bulluc*, a young bull, survives in bullock, now confined to a young castrated male ox kept for slaughter.

The term "bull's eye" is applied to many circular objects and particularly to the boss or protuberance left in the centre of a sheet of blown glass, which was formerly used for windows in small leaded panes (cf. French *œil de bœuf*, a circular window). Other circular objects to which the word is applied are the centre of a target, a plano-convex lens in a microscope, a lantern with a convex glass, a thick circular glass let into the deck or side of a ship for lighting, a ring-shaped block grooved round the outer edge, with a hole through which a rope can be passed, and a small lurid cloud which in certain latitudes presages a hurricane.

(2) The use of the word "bull," for a verbal blunder, involving a contradiction in terms, is of doubtful origin. It is used with a possible punning reference to papal bulls in Milton's *True Religion*, "and whereas the Papist boasts himself to be a Roman Catholick, it is a mere contradiction, one of the Pope's Bulls, as if he should say a universal particular, a Catholick schismatick." Although modern associations connect this type of blunder with the Irish, the early quotations show that in the 17th century, no special country was credited with them.

(3) *Bulla* (Lat. for "bubble") was the term used by the Romans for any boss or stud, such as those on doors, sword-belts, shields, and boxes. It was applied, more particularly, to a round or heart-shaped box, generally of gold, containing an amulet, worn suspended from the neck by children of noble birth until they assumed the *toga virilis*, when it was hung up and dedicated to the household gods (see COSTUME: Etruscan). The custom of wearing the bulla as a charm against sickness and the evil eye was of Etruscan origin. After the Second Punic War all children of free birth were permitted to wear it. Its use was only permitted to grown-up men in the case of generals who celebrated a triumph. Young girls and even favourite animals also wore it. (See Ficoroni, *La Bolla d'Oro*, 1732; Yates *Archaeological Journal*, vi., 1849; viii., 1851.) In ecclesiastical and mediaeval Latin, *bull*a denotes the seal of oval or circular form, bearing the name and generally the image of its owner, which was attached to official documents. The best-known instances are the papal *bullae*, which have given their name to the documents (bulls) to which they are attached. (See DIPLOMATIC; SEALS: CURIA ROMANA; GOLDEN BULL.)

(4) "Bull" is also a term used in speculative markets, such as the Stock Exchange, to describe a speculator who buys in the hope of a rise in prices. The term is usually applied, not to those who buy and pay for stock but to those who buy "for the account" in the hope that a rise will take place before the settle-

ment, so that they can sell out at a profit without actually paying for their purchase. Thus, on the London Stock Exchange, where the settlements are fortnightly, this involves speculating for a rise within the fortnight, and when settling day comes the "bull" has either to sell, taking his marginal profit or meeting his marginal loss, or pay a rate for continuation into another fortnightly account. (See STOCK EXCHANGE; SETTLEMENT; CONTANGO.)

**BULLA REGIA**, ancient city of Numidia, near modern Souk-el-Arba, on the railway between Tunis and the Algerian frontier. It was formerly the residence of the kings of Numidia. Under the Roman empire it was on the road from Carthage to Hippo Regius, and received benefits from various emperors, notably Hadrian. A theatre, a temple of Apollo facing on to a large courtyard, and some well-preserved houses have been found.

See A. Merlin, *Le Temple d'Apollon à Bulla Regia* (1908).

**BULLARD, ROBERT LEE** (1861– ), American soldier, was born at Youngsboro, Ala., on Jan. 15, 1861. He graduated from West Point military academy in 1885 and was appointed first lieutenant in 1892. He served in various capacities in the Spanish-American War, and in the Philippines from 1902 to 1904. He was made lieutenant-colonel in 1906. In 1907 he was special investigator for the U.S. Provisional Government in Cuba, and the following year was superintendent of public instruction there. In 1911 he was promoted colonel, and in 1917 brigadier-general. He commanded the 2nd Brigade of the 1st Division of the American Expeditionary Force in France in 1917, and was made major-general, National Army. From the middle of Dec. 1917 to the middle of July 1918 he commanded the 1st Division; and from Oct. 1918 to the following July the II. Army. In Nov. 1918 he was appointed major-general in the regular army. At the opening of the second battle of the Marne, July 1918, which marked the turning-point of the war, Bullard wrote the message concluding with the words, "we are going to counter-attack." In 1925 he retired from active service. Besides numerous articles in magazines and military journals he wrote *Personalities and Reminiscences of the War* (1925).

**BULLEN, ARTHUR HENRY** (1857–1920), British man of letters, was born in London on Feb. 9, 1857 and educated at the City of London school and Balliol college, Oxford. He was the son of George Bullen, sometime keeper of the printed books at the British Museum. He was an authority on 16th and 17th century literature, and discovered many lost poems of the period in the Bodleian and Christ Church libraries at Oxford; his greatest achievement was the rediscovery of Thomas Campion (*q.v.*) in 1889 after nearly 300 years of neglect (see CAMPION, THOMAS). For several years he was a partner in the publishing house of Lawrence and Bullen, and after its dissolution founded the Shakespeare Head Press at Stratford-on-Avon in 1904, which was sold to B. H. Blackwell of Oxford after his death. He died at Stratford-on-Avon on Feb. 29, 1920.

**BULLER, CHARLES** (1806–1848), English politician, born in Calcutta on Aug. 6, 1806; was educated at Harrow, then privately in Edinburgh by Thomas Carlyle, and afterwards at Trinity college, Cambridge. He sat in parliament from 1830 until his death in London on Nov. 29, 1848. An eager reformer and a friend of John Stuart Mill, Buller went to Canada with Lord Durham in 1838 as private secretary, and was for a long time supposed to have written Lord Durham's famous *Report on the Affairs of British North America*. It certainly shows signs of his influence. Buller was made judge-advocate-general in 1846 and became chief commissioner of the Poor Law about a year before his death. Buller was witty, popular, and generous, and is described by Carlyle as "the genialest radical I have ever met."

See T. Carlyle, *Reminiscences* (1881); S. J. Reid, *Life and Letters of the 1st earl of Durham* (1906).

**BULLER, SIR REDVERS HENRY** (1839–1908), British general, was born on Dec. 7, 1839, at Downes, Crediton, Devon, of a family settled in Cornwall for three centuries. He was educated at Eton, entered the army in 1858, and served with the 60th (King's Royal Rifles) in the China campaign of 1860. In

1870 he became captain, and went on the Red River expedition, where he was first associated with Colonel (afterwards Lord) Wolseley. In 1873–74 he accompanied the latter in the Ashantee campaign as head of the intelligence department. He served in the Kafir War of 1878–79 and the Zulu War of 1879, and in the retreat at Inhlobane (March 28, 1879) he earned the V.C. In the Boer War of 1881 he served as Sir Evelyn Wood's chief of staff. In 1882 he was head of the field intelligence department in Egypt. In 1884 he commanded an infantry brigade in the Sudan under Sir Gerald Graham, and was at the battles of El Teb and Tamai, being promoted major-general for distinguished service. In the Sudan campaign of 1884–85 he was Lord Wolseley's chief of staff, and commanded the desert column when Sir Herbert Stewart was wounded. He distinguished himself by his conduct of the retreat from Gubat to Gakdul, and by his victory at Abu Klea (Feb. 16–17) and he was created K.C.B. In 1886 he was sent to Ireland to inquire into the "moonlighting" outrages, and for a short time he acted as under-secretary for Ireland; but he was too much in sympathy with the Irish peasants to find the position tolerable, and on Oct. 15, 1887 he was appointed quarter-master-general at the war office. In 1896 he was made a full general. From 1890 to 1897 he held the office of adjutant-general, being made lieutenant-general in 1891.

In 1898 he took command of the troops at Aldershot, and when the Boer War broke out in 1899 he was selected to command the South African field force (see TRANSVAAL), and landed at Cape Town on Oct. 31. Owing to the Boer investment of Ladysmith and the consequent gravity of the military situation in Natal, he left Methuen to relieve Kimberley, French and Gatacre to cover Cape Colony, and went to Natal himself. On Dec. 15 his first attempt to cross the Tugela at Colenso was repulsed. The Government, alarmed at the situation and the pessimistic tone of Buller's messages, sent out Lord Roberts to supersede him in the chief command, Sir Redvers being left in subordinate command of the Natal force. His second attempt to relieve Ladysmith (Jan. 10–27) proved another failure, the result of the operations at Spion Kop (Jan. 24), where Sir Charles Warren was in command, causing consternation in England. Responsibility was divided, and there was some argument. Buller's despatch was censored, and only appeared in full in 1902. A third attempt (Vaalkrantz, Feb. 5–7) was unsuccessful, but the Natal army finally accomplished its task in the series of actions which culminated in the victory of Pieter's Hill and the relief of Ladysmith on Feb. 27. Sir Redvers Buller remained in command of the Natal army till Oct. 1900, when he returned to England (being created G.C.M.G.), having in the meanwhile done a great deal of hard work in driving the Boers from the Biggarsberg (May 15), forcing Lang's Nek (June 12), and occupying Lydenburg (Sept. 6). But though these latter operations had done much to re-establish his reputation for dogged determination, and he had never lost the confidence of his own men, his capacity for an important command in delicate and difficult operations was now seriously questioned. The continuance, therefore, in 1901 of his appointment to the important Aldershot command met with a vigorous Press criticism, in which the detailed objections taken to his conduct of the operations before Ladysmith (and particularly to a message to Sir George White in which he provided for the contingency of surrender) were given new prominence. On Oct. 10, 1901, at a luncheon in London, Sir Redvers Buller made a speech in answer to these criticisms in terms which were held to be a breach of discipline, and he was placed on half-pay a few days later. A motion (July 17, 1902) by Sir Edward Grey in the House of Commons censuring government action in this case was defeated. For the remaining years of his life Buller lived as a country gentleman, accepting in dignified silence the prolonged attacks on his failures in South Africa; among the public generally, and particularly in his own county, he never lost his popularity. He died on June 2, 1908. He had married in 1882 Lady Audrey, daughter of the 4th Marquess Townshend, who survived him with one daughter.

See *South African Despatches* (1901), and Royal Comm. on the war in South Africa, *Evidence* ii., 169–223 and appendix J (1904); also a brief *Memoir*, by Captain Lewis Butler of Buller's own regiment (1909).

**BULLET** (Fr. *boulet*, diminutive of *boule*, ball). The original meaning (a "small ball") has, since the end of the 16th century, been narrowed down to the special case of the projectile used with small arms of all kinds, irrespective of its size or shape. (For details see **AMMUNITION**; **SMALL ARMS**, **DEVELOPMENT OF**.)

**BULL-FIGHTING**, the national Spanish sport. The Spanish name is *tauromaquia* (Gr. *ταῦρος*, bull, and *μαχή*, combat). Combats with bulls were common in ancient Thessaly as well as in the amphitheatres of imperial Rome, but probably partook more of the nature of worrying than fighting, like the bull-baiting formerly common in England. The Moors of Africa also possessed a sport of this kind, and it is probable that they introduced it into Andalusia when they conquered that province. It is certain that they held bull-fights in the half-ruined Roman amphitheatres of Merida, Cordova, Tarragona, Toledo and other places, and that these constituted the favourite sport of the Moorish chieftains. Although patriotic tradition names the great Cid himself as the original Spanish bull-fighter, it is probable that the first Spaniard to kill a bull in the arena was Don Rodrigo Diaz de Vivar, who about 1040, employing the lance, which remained for centuries the chief weapon used in the sport, proved himself superior to the flower of the Moorish knights. A spirited rivalry in the art between the Christian and Moorish warriors resulted, in which even the kings of Castile and other Spanish princes took an ardent interest. After the Moors were driven from Spain by Ferdinand II., bull-fighting continued to be the favourite sport of the aristocracy, the method of fighting being on horseback with the lance. At the time of the accession of the house of Austria it had become an indispensable accessory of every court function, and Charles V. ensured his popularity with the people by killing a bull with his own lance on the birthday of his son, Philip II. Philip IV. is also known to have taken a personal part in bull-fights. During this period the lance was discarded in favour of the short spear (*rejoncillo*), and the leg armour still worn by the *picadores* was introduced. The accession of the house of Bourbon witnessed a radical transformation in the character of the bull-fight, which the aristocracy began gradually to neglect, admitting to the combats professional subordinates who, by the end of the 17th century, had become the only active participants in the bull-ring. The first great professional *espada* (i.e., swordsman, the chief bull-fighter, who actually kills the bull) was Francisco Romero, of Ronda in Andalusia (about 1700), who introduced the *estoque*, the sword still used to kill the bull, and the *muleta*, the red flag carried by the *espada* (see below), the spear falling into complete disuse.

The cruelty of the sport has prevented its taking root in France and Italy. In Portugal a kind of bull-baiting is practised, in which neither man nor beast is much hurt, the bulls having their horns truncated and padded and never being killed. Before the introduction of railways there were few bull-rings (*plazas de toros*) in Spain, but these have largely multiplied in recent years in both Spain and Spanish America. At the present day nearly every larger town and city in Spain has its *plaza de toros* (about 225 altogether), built in the form of the Roman circuses. The *plazas de toros* are of all sizes, from that of Madrid, which holds 12,000 spectators, down to those seating only two thousand.

The bulls used for fighting are invariably of well-known lineage and are reared in special establishments (*vacádas*), the most celebrated of which is now that of the duke of Veragua in Andalusia. When quite young they are branded with the emblems of their owners, and later are put to a test of their courage, only those that show a fighting spirit being trained further. When full grown, the health, colour, weight, character of horns, and action in attack are all objects of the keenest observation and study. The best bulls are worth from £40 to £60. About 1,300 bulls are killed annually in Spain. Bull-fighters proper, most of whom are Andalusians, consist of *espadas* (or *matadores*), *banderilleros* and *picadores*, in addition to whom there are numbers of assistants (*chulos*), drivers and other servants. For each bull-fight two or three *espadas* are engaged, each providing his own cuadrilla (*cuadrilla*), composed of several *banderilleros* and *picadores*. Six bulls are usually killed during one *corrida* (bull-fight),

the *espadas* engaged taking them in turn. The *espada* must have passed through a trying novitiate in the art at the royal school of bull-fighting, after which he is given his *alternativa*, or licence.

The bull-fight begins with a grand entry of all the bull-fighters with *alguaciles*, municipal officers in ancient costume, at the head, followed, in three rows, by the *espadas*, *banderilleros*, *picadores*, *chulos*, and the richly caparisoned triple mule-team used to drag from the arena the carcasses of the slain bulls and horses. The greatest possible brilliance of costume and accoutrements is aimed at, and the picture presented is one of dazzling colour. The *espadas* and *banderilleros* wear short jackets and small-clothes of satin richly embroidered in gold and silver, with light silk stockings and heelless shoes; the *picadores* (pikemen on horseback) usually wear yellow, and their legs are enclosed in steel armour covered with leather as a protection against the horns of the bull.

The fight is divided into three divisions (*suertes*). When the opening procession has passed round the arena the president of the *corrida*, usually some person of rank, throws down to one of the *alguaciles*, the key to the *toril*, or bull-cells. As soon as the supernumeraries have left the ring, and the *picadores*, mounted upon blindfolded horses in wretched condition, have taken their places against the barrier, the door of the *toril* is opened, and the bull, which has been goaded into fury by the affixing to his shoulder of an iron pin with streamers of the colours of his breeder attached, enters the ring. Then begins the *suerte de picar*, or division of lancing. The bull at once attacks the mounted *picadores*, ripping up and wounding the horses, often to the point of complete disembowelment. As the bull attacks the horse, the *picador*, who is armed with a short-pointed, stout pike (*garrocha*), thrusts this into the bull's back with all his force, with the usual result that the bull turns its attention to another *picador*. Not infrequently, however, the rush of the bull and the blow dealt to the horse is of such force as to overthrow both animal and rider, but the latter is usually rescued from danger by the *chulos* and *banderilleros*, who, by means of their red cloaks (*capas*), divert the bull from the fallen *picador*, who either escapes from the ring or mounts a fresh horse. The number of horses killed in this manner is one of the chief features of the fight, a bull's prowess being reckoned accordingly. About 6,000 horses are killed every year in Spain. At the sound of a trumpet the *picadores* retire from the ring, the dead horses are dragged out, and the second division of the fight, the *suerte de banderillar*, or planting the darts, begins. The *banderillas* are barbed darts about 18 in. long, ornamented with coloured paper, one being held in each hand of the bull-fighter, who, standing 20 or 30 yds. from the bull, draws its attention to him by means of violent gestures. As the bull charges, the *banderillero* steps towards him, dexterously plants both darts in the beast's neck, and draws aside in the nick of time to avoid its horns. Four pairs of *banderillas* are planted in this way, rendering the bull mad with rage and pain. Should the animal prove of a cowardly nature and refuse to attack repeatedly, *banderillas de fuego* (fire) are used. These are furnished with fulminating crackers, which explode with terrific noise as the bull careers about the ring. During this division numerous manoeuvres are sometimes indulged in for the purpose of tiring the bull out, such as leaping between his horns, vaulting over his back with the *garrocha* as he charges, and inviting his rushes by means of elaborate flourishes of the cloak (*floréos*, flourishes).

Another trumpet-call gives the signal for the final division of the fight, the *suerte de matar* (killing). This is carried out by the *espada* alone, his assistants being present only in the case of emergency or to get the bull back to the proper part of the ring, should he bolt to a distance. The *espada*, taking his stand before the box of the president, holds aloft in his left hand sword and *muleta* and in his right his hat, and in set phrases formally dedicates (*brinde*) the death of the bull to the president or some other personage of rank, finishing by tossing his hat behind his back and proceeding bareheaded to the work of killing the bull. This is a process accompanied by much formality. The *espada*, armed with the *estoque*, a sword with a

heavy flat blade, brings the bull into the proper position by means of passes with the *muleta*, a small red silk flag mounted on a short staff, and then essays to kill him with a single thrust, delivered through the back of the neck close to the head and downward into the heart. This stroke is a most difficult one, requiring long practice as well as great natural dexterity, and very frequently fails of its object, the killing of the bull often requiring repeated thrusts. The stroke (*estocada*) is usually given *à volapié* (half running), the *espada* delivering the thrust while stepping forward, the bull usually standing still. Another method is *recibiendo* (receiving), the *espada* receiving the onset of the bull upon the point of his sword. Should the bull need a *coup de grâce*, it is given by a *chulo*, called *puntillero*, with a dagger which pierces the spinal marrow. The dead beast is then dragged out of the ring by the triple mule-team, while the *espada* makes a tour of honour, being acclaimed, in the case of a favourite, with the most extravagant enthusiasm. The ring is then raked over, a second bull is introduced, and the spectacle begins anew. Upon great occasions, such as a coronation, a *corrida* in the ancient style is given by amateurs, who are clad in gala costumes without armour of any kind, and mounted upon steeds of good breed and condition. They are armed with sharp lances, with which they essay to kill the bull while protecting themselves and their steeds from his horns. As the bulls in these encounters have not been weakened by many wounds and tired out by much running, the performances of the amateur fighters are remarkable for dexterity. In 1927 there was a strong movement in Spain for protecting the horses used in the bullring, and several kinds of armour have been invented for this purpose.

Buck, *Wild Spain* (1893); Ella Bourne, "Ancient Bull-Fights," *Art and Archaeology*, vol. v., pp. 142-153 (1917); Nicholas Rangel, *Historia del toro en Mexico, epoca colonial, 1529-1821* (1924); and Hermann Handke, *Spanische Stierkämpfe* (Braunschweig, 1928).

**BULLFINCH**, a finch of the genus *Pyrrhula*, especially the common European (*Pyrrhula pyrrhula*), bluish-grey and black above, and generally of a bright tile-red beneath, the female having its underparts chocolate-brown. It is a shy bird and frequents well-wooded districts. In May it builds a shallow nest of twigs lined with fibrous roots on low trees or thick underwood, and lays four or five bluish-white eggs speckled and streaked with purple. The young remain with their parents during autumn and winter, and pair in spring. In spring and summer they feed on the buds of trees and bushes, thus doing considerable injury to orchards and gardens. In autumn and winter they feed on wild fruits and on seeds. The note of the bullfinch, in the wild state, is soft and pleasant, but low; it possesses great powers of imitation, and can be taught to whistle tunes. The bullfinch breeds in northern Europe, occurring in southern parts only as a winter visitor. It rarely breeds in captivity. Black plumage can be induced by feeding solely with hemp-seed. Other species are found in eastern Europe and Asia, and one which is native to southern and eastern Siberia (*P. cassini*) sometimes migrates to Alaska.

**BULLFROG** (*Rana catesbiana*), the largest frog (*q.v.*) of North America, where it ranges from Mexico to Canada, being absent, however, from the west of the continent. In full grown specimens the body, which is green or greenish-brown above and white beneath, attains a length of 8 in., and the spotted or barred hind legs, a length of 10 inches. It feeds on any living animal matter which it can swallow, and is in its turn devoured by snakes, fishes, herons, alligators, etc., besides being caught in large numbers for the table. The name is also applied to other large frogs.

**BULLHEAD**: see MILLER'S THUMB.

**BULLI**, one of a number of small coal-mining towns of the Illawarra district, New South Wales, Australia. It is situated some 40 m. S. of Sidney on a narrow coastal platform at the base of the abrupt scarp of the Illawarra coast "range" (plateau) across which a road leads through fine scenery via Bulli pass (c. 1,000 ft. high, Sublime point 1,330 ft.). Permo-Carboniferous rocks (Upper or Newcastle-Bulli Coal Measures and Upper Marine

series) outcrop along this coast between Wollongong and Clifton (Coal cliff), being c. 1,000 ft. thick at Bulli; they represent the southern outcrop of the rim of the Sydney coal basin. Reserves of c. 500,000,000 tons of workable coal exist in the area (120 sq.m.) but of the seven existing seams only the top (Bulli) seam has been worked to any extent. The coal crops out on the scarp behind Bulli at c. 300 ft. It can be worked by horizontal adits; the coal trucks run down by gravity to the coast directly on to the wharves. The Bulli seam is 6 ft. thick and is good steam coal, nearly smokeless, and useful for naval, as well as for metallurgical purposes. The output of the southern field as a whole is normally about 2,000,000 tons per annum. The harbour is exposed to gales but, since 1901, Port Kembla (near Wollongong, 11 m. farther south) has been used as an exporting centre. The coal is conveyed by colliers to Sydney and to Queensland ports but is partly converted into coke on the fields and will doubtless be increasingly consumed in the growing industries of Port Kembla. Bulli lies on the coastal railway which runs from Sydney (59 m. by rail) south as far as Nowra.

**BULLINGER, HEINRICH** (1504-1575), Swiss reformer, son of Dean Heinrich Bullinger by his wife Anna, was born at Bremgarten, Aargau, July 18, 1504. He studied at Emmerich and Cologne, where the teaching of Peter Lombard led him, through Augustine and Chrysostom, to first-hand study of the Bible; he then began to read the writings of Luther and Melancthon. Appointed teacher (1522) in the cloister school of Cappel, he lectured on Melancthon's *Loci Communes* (1521). He heard Zwingli at Zürich in 1527 and in 1528 accompanied him to the disputation at Berne. He was made pastor of Bremgarten in 1529, and married Anna Adlischweiler, a nun, by whom he had 11 children. After the battle of Cappel (Oct. 11, 1531), in which Zwingli fell, he left Bremgarten, and on Dec. 9 he was chosen to succeed Zwingli as chief pastor of Zürich. A strong writer and thinker, his spirit was essentially unifying and sympathetic, in an age when these qualities won little sympathy. His controversies on the Lord's Supper with Luther, and his correspondence with Lelio Sozini (see SOCNUS), exhibit, in different connections, his admirable mixture of dignity and tenderness. With Calvin he concluded (1549) the *Consensus Tigurinus* on the Lord's Supper. The (second) Helvetic Confession (1566), adopted in Switzerland, Hungary, Bohemia, and elsewhere, was his work. The volumes of the *Zürich Letters*, published by the Parker Society, testify to his influence on the English reformation in later stages. Many of his sermons were translated into English (reprinted, 1849). His works, mainly expository and polemical, have not been collected.

See Carl Pestalozzi, *Leben* (1858); Raget Christoffel, *H. Bullinger* (1875); Justus Heer, in Herzog-Hauck's *Realencyklopädie* (1897). (A. Go.)

**BULLION**, the name given to gold and silver considered solely as merchandise. When coin and specie are treated as bullion it is their weight and fineness which are reckoned, not their face value. Bullion thus means the gold and silver of the mines brought to a standard of purity. The word appears in an English act of 1336 in the French form "puissent sauvement porter à les échanges ou bullion . . . argent en plate, vessel d'argent, etc."; and apparently it is connected with *bouillon*, the sense of "boiling" being transferred in English to the melting of metal, so that *bullion* in the passage quoted meant "melting-house" or "mint." The first recorded instance of the use of the word for precious metal as such in the mass is in an act of 1451.

From the use of gold and silver as a medium of exchange, it followed that they should approximate in all nations to a common degree of fineness; and though this is not uniform even in coins, yet the proportion of alloy in silver, and of carats alloy to carats fine in gold, has been reduced to infinitesimal differences in the bullion of commerce, and is a prime element of value even in gold and silver plate, jewellery, and other articles of manufacture. Bullion, whether in the form of coins, or of bars and ingots stamped, is subject, as a general rule of the London market, not only to weight but to assay, and receives a corresponding value. The work of weighing and assaying bullion is undertaken by the bullion brokers, who have to deal with parcels of very variable

shape, for bullion may be bar-gold, or gold-dust, or coins of many different degrees of fineness.

**BULL MOOSE**, the symbol of the Progressive Party in the American presidential election of 1912. The bull moose is the male of the large, ungainly branch of the deer family inhabiting forested parts of Canada and north-eastern United States. It is closely allied to the European elk, standing over seven feet high, and often weighing over 1,000 pounds. The origin of the term as a symbol probably lies in the remark of ex-president Roosevelt: "I feel as fit as a bull moose." The cartoonists seized the remark, and the animal quickly became the emblem of the Roosevelt forces, and then of the Progressive Party, popularly known as the "Bull Moose Party." When the Progressive Republicans declared themselves opposed to the renomination of President Taft and brought about a three-cornered election, the bull moose became a very useful symbol as opposed to the elephant of the regular Republicans and the donkey of the Democrats.

**BULLOCK, WILLIAM** (c. 1657-c. 1740), English actor, "of great glee and much comic vivacity," was the original Clincher in Farquhar's *Constant Couple* (1699), Boniface in *The Beaux' Stratagem* (1707), and Sir Francis Courtall in Paveners' *Artful Wife* (1717). He played at all the London theatres of his time, and in the summer at a booth at Bartholomew Fair. He had three sons, all actors. Christopher created a few original parts in comedies and farces of which he was the author or adapter:—*A Woman's Revenge* (1715); *Slip; Adventures of Half an Hour* (1716); *The Cobbler of Preston*; *Woman's a Riddle*; *The Perjurer* (1717), and *The Traitor* (1718).

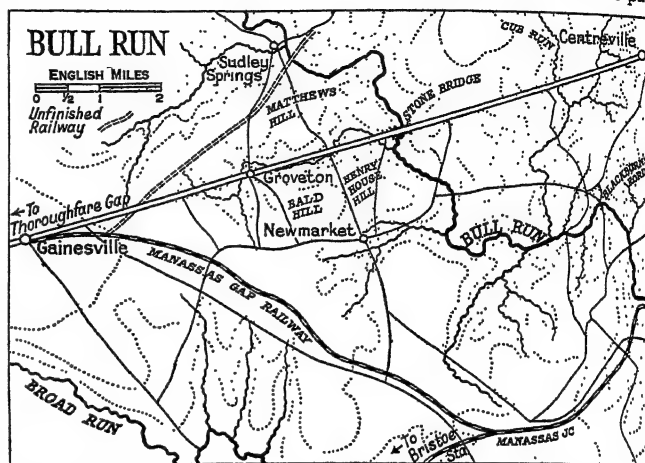

**BULLROARER**, the English name for an instrument made of a small flat slip of wood, through a hole in one end of which a string is passed; swung round rapidly it makes a booming, humming noise. Though treated as a toy by Europeans, the bullroarer has the highest mystic significance and sanctity among primitive people. In Australia it figures in the initiation ceremonies and is regarded with the utmost awe by the "blackfellows." Their bullroarers, or sacred "tunduns," are of two types, the "grandfather" or "man tundun," distinguished by its deep tone, and the "woman tundun," which, being smaller, gives forth a weaker, shriller note. Women or girls, and boys before initiation, are never allowed to see the tundun. At the Bora, or initiation ceremonies, the bullroarer's hum is believed to be the voice of the "Great Spirit," and on hearing it the women hide in terror. A Maori bullroarer is preserved in the British Museum, and in Africa it is known and held sacred. Thus among the Yoruba the principal sign of the Oro secret society is a bullroarer. The sanctity of the bullroarer was very widespread. The rhombus (Gr. *ῥόμβος*) which was whirled at the Greek mysteries was one. Among North American Indians it was common. At certain Moqui ceremonies the procession of dancers was led by a priest who whirled a bullroarer. The instrument has been traced among the Tusayan, Apache and Navaho Indians (J. G. Bourke, *Ninth Annual Report of Bureau of Amer. Ethnol.* 1892), among the Koskimo of British Columbia (Fr. Boas, "Social Organization, etc., of the Kwakiutl Indians," *Report of the U.S. National Museum for 1895*), and in Central Brazil. In New Guinea, in some of the islands of the Torres Straits it is swung as a fishing charm. In Ceylon it is used as a toy and figures as a sacred instrument at Buddhist festivals. In Sumatra it is used to induce the demons to carry off the soul of a woman, and so drive her mad. Sometimes, as among the Minangkabos of Sumatra, it is made of the frontal bone of a man renowned for his bravery. With the Ao Nagas, it is apt to bring sickness, while elsewhere in Assam it drives or keeps sickness away.

**BULL RUN**, a small river in Virginia, U.S.A., which gave the name to two famous battles in the American Civil War.

(1) The first battle of Bull Run (called by the Confederates Manassas) was fought on July 21, 1861, between the Union

forces under McDowell and the Confederates under Gens. *Joseph E. Johnston*<sup>1</sup> and *Beauregard*. Both armies were newly raised and almost untrained. After a slight action on the 18th at Blackburn's ford, the two armies prepared for a battle. The Confederates were posted along Bull Run, guarding all the passages from the stone bridge down to the railway bridge. McDowell's forces concentrated around Centreville, and both commanders, sensible of the temper of their troops, planned a battle for the 21st. On his part

**BULL RUN.** SCENE OF TWO BATTLES DURING THE AMERICAN CIVIL WAR. The first battle was fought on July 21, 1861, the second on the last days of August, 1862.

McDowell ordered one of his four divisions to attack the stone bridge, two to make a turning movement via Sudley ford, 2m. distant; the remaining division (which had a stiffening of regular troops) was to be in reserve and to watch the lower fords. The local Confederate commander, *Beauregard*, had also planned a turning movement by the lower fords against the Federal left, but *Johnston*, who arrived by rail on the evening of the 20th with reinforcements, now assumed command of the whole force. The change in control caused delay, orders miscarried, and the Federal attack opened before the movement had begun. *Johnston* and *Beauregard* then decided to fight a defensive battle, and hurried up troops to support the single demi-brigade of *Evans* which held the stone bridge. Thus there was no serious fighting at the lower fords of Bull Run throughout the day.

The Federal staff was equally inexperienced, and the divisions engaged in the turning movement were two hours late at Sudley ford. At 6 A.M., when the troops, told off for the frontal attack, appeared before the stone bridge, the turning movement was by no means well advanced. *Evans* had time to move 11 of his 15 companies to Matthews hill, covering Sudley springs, leaving the rest to hold the stone bridge, and he was promptly supported by the brigades of *Bee*, *Bartow* and *T. J. Jackson*. About 9:30 the leading Federal brigade from Sudley springs came into action; two hours later a flank threat by two other brigades, which had crossed at an intermediate ford, drove *Evans*, *Bee* and *Bartow* from Matthews hill in considerable confusion. But on the Henry House hill *Jackson's* brigade stood, as Gen. *Bee* said to his men, "like a stone wall," and the defenders rallied, though the Federals were continually reinforced. The fighting on the Henry House hill was very severe, but McDowell, who dared not halt to re-form his enthusiastic volunteers, continued to throw in piecemeal attacks. About 1:30 P.M. he brought up two regular batteries to the fighting line; but a Confederate regiment, being mistaken for friendly troops and allowed to approach, silenced the guns by close rifle fire, and the Federal attack, despite repeated efforts, made no further headway. By 4 P.M. some more of *Beauregard's* troops came up; *Jackson's* brigade charged with the bayonet, and at the same time the Federals were assailed in flank by the last brigade of *Johnston's* army, which arrived at the critical moment from the railway. They gave way at once, melting away slowly to the rear, the handful of regulars alone keeping their order. But when,

<sup>1</sup>In this and other American Civil War articles the names of Confederate generals, statesmen, and ships are given in italics.

at the bridge over the Cub Run, they came under shell fire the retreat became a panic flight to the Potomac. The victors were too exhausted to pursue, and the U.S. regulars of the reserve division formed a strong and steady rearguard. The losses were: Federals, 2,896 men out of about 18,500 engaged; Confederates, 1,982 men out of 18,000. (X.)

The second battle was fought (Aug. 29–30, 1862) between the Army of Northern Virginia under *R. E. Lee* and a Federal force commanded by Pope, who had been recently appointed to command a new army consisting of three corps, which had been conducting independent and unsuccessful operations against *Jackson* in the Shenandoah Valley. When Halleck, the newly appointed General-in-Chief, decided to withdraw McClellan's army from the Peninsula, it became Pope's duty to cover Washington until a junction of the two armies could be effected for a fresh campaign against Richmond. Pope retired from the Rapidan behind the Rappahannock (Aug. 19), followed by *Lee* from Gordonsville. As Halleck had directed that McClellan's troops should disembark at Aquia Creek, Pope was instructed to hold on to the line of the Rappahannock and prevent *Lee* from crossing. Pope had only 45,000 against *Lee*'s 55,000, but aided by a sudden freshet in the river he was able to hold *Lee* in check till the 25th, when, screened by *Stuart's* cavalry, *Jackson* started his famous flank march round Pope's right flank. Passing through Thoroughfare Gap he marched 50m. in two days, reaching the railway at Bristoe before sunset (Aug. 26) and capturing Manassas Junction, Pope's supply depot, by midnight. Having rested and refreshed his troops (Aug. 27) he set fire to the depot in the night and withdrew his force north of the Warrenton turnpike, where by noon (Aug. 28) his three divisions were hidden in the woods, his right within 12m. of Thoroughfare Gap, and an alternative line of retreat open behind him to Aldie Gap. Federal signallers had early detected *Jackson's* march, but at first Pope believed that he was most probably bound for the Valley. When next day *Jackson* was reported coming through Thoroughfare Gap, Pope in the evening ordered a general concentration about Warrenton (Aug. 26). He had just been reinforced by two corps from the Army of the Potomac and had now fully 70,000 men under his command. But on hearing that his railway communications had been interrupted, later in the night he ordered a concentration of his right wing at Gainesville with three divisions in support at Greenwich, and sent Hooker's division up the railway to reopen communications with Alexandria. When Hooker's encounter with *Ewell* on Broad Run in the afternoon (Aug. 27) showed that *Jackson's* whole force was at Manassas, he ordered a general concentration on that place, expecting next morning to find *Jackson* holding the entrenchments. At noon (Aug. 28) he reached Manassas and found that *Jackson* had disappeared, but at 4:15 P.M. hearing that *A. P. Hill's* division had been seen at Centreville (*Hill* had marched there from Manassas and then recrossed Bull Run at the Stone Bridge) he ordered his whole army to march on Centreville. McDowell on his own initiative sent Rickett's division to hold Thoroughfare Gap, but Pope had entirely left *Longstreet* out of his calculations. *Lee* with *Longstreet's* wing (less *Anderson's* division left at Waterloo Bridge) followed *Jackson* (Aug. 26) but at nightfall (Aug. 27) was still west of the mountains. The next afternoon his advanced guard encountered Ricketts in the Gap. The Federals held their ground, but after dark retired to Gainesville. About 5:30 P.M. (Aug. 28) King's division of McDowell's corps was marching along the turnpike towards Centreville, when it was attacked by two of *Jackson's* divisions near Groveton. A fierce but indecisive engagement ensued. *Jackson* had deliberately revealed his position in order to lure Pope back into *Lee's* clutches. He supposed that Pope was in full retreat, and sought to prevent him getting behind Bull Run, where he could take a strong defensive position and await reinforcements. Pope fell into the trap. Believing that *Jackson* was retreating but had been intercepted by McDowell's corps, he ordered his forces to assemble on the Warrenton pike and attack *Jackson* next morning. But he had now lost touch with several of his units. During the night King and Ricketts withdrew to Manassas and Bristoe respectively. Only Sigel's corps and

Reynolds' division were available to attack *Jackson* before noon (Aug. 29). Sigel made two ineffectual attacks in the morning. Then Pope arrived from Centreville with four divisions. These made three more attacks on *Jackson's* left, but from lack of co-ordination they all failed. *Jackson* held a strong position; his front line occupied the embankment of an unfinished railway; his artillery was posted on a ridge 500yd. in the rear; as his line was only 3,000yd. long, he could hold half of his 18,000 infantry in reserve and, when *Longstreet* came upon the field, draw troops from his own right to aid his hard-pressed left. All five Federal attacks had been directed against *Hill's* division, because on its front a belt of wood extended south of the railway cutting and afforded cover for the assailants. Reynolds' division on the left, which would have had to attack over open ground, was held in check by artillery fire. Pope had expected that while he was attacking *Jackson's* left Porter's and McDowell's corps would fall upon the enemy's right flank and rear. But these troops encountered *Longstreet*. The latter had marched through the Gap at sunrise (Aug. 29) and by noon had drawn up his line of battle across the turnpike. *Jones's* division he placed across the Manassas Gap R.R. to hold off any force advancing from Manassas. Thrice *Lee* urged him to attack down the pike. But *Longstreet* in *Anderson's* absence would only send late in the evening *Hood's* division to make a reconnaissance in force. Porter and McDowell were marching from Manassas to Gainesville, when they encountered *Jones's* division. It was plain that Pope when writing his "Joint-Order" at Centreville had entirely misread the situation. McDowell withdrew his corps and marched to join Pope on the turnpike, where King's division encountered *Hood* and was driven back some distance. Porter remained on *Longstreet's* front until dark, when he retired to Manassas. *Lee* did not intend to assume the offensive next day. Three divisions from Richmond had crossed the Rappahannock and till their arrival he would leave Pope the initiative. Pope believing that the enemy was retreating, at noon (Aug. 30) ordered a general pursuit under McDowell's charge. McDowell soon realized his commander's mistake and, whilst organizing an attack against *Jackson*, endeavoured to secure his exposed flank by occupying in force the Bald and Henry House Hills. Porter's corps and King's division attacked with such determination that *Jackson* signalled to *Lee* for help. *Longstreet* brought up more batteries on his left, and their fire enfilading the Federal lines quickly stopped the attack. At 4 P.M. *Lee* launched his counterstroke. *Longstreet* with all his five divisions bore down upon the Federal left, which he already overlapped. But the attack was made too late for *Lee* to achieve a complete victory. Bald Hill, only held by one brigade, because Pope had withdrawn Reynolds's division to take position in Porter's rear, was captured and all attempts to recapture it failed, and *Jackson* pressed the Federal right back towards the turnpike. But Sykes's two brigades of regulars and other troops held the Henry House Hill against all assaults, and in the gathering darkness Pope withdrew his beaten army across Bull Run and retreated to Centreville, where Franklin's corps from Alexandria had just arrived. *Lee* resorted to another outflanking movement and *Jackson* had a sharp but indecisive encounter at Chantilly (Sept. 1) with two Federal divisions sent by Pope to protect his retreat against a flank attack. Though reinforced at Centreville by Sumner's corps and still considerably outnumbering *Lee* in spite of the latter's reinforcements, Pope had lost heart and sought safety in the fortifications of Washington (Sept. 2). His losses from Aug. 28 to Sept. 1 amounted to over 14,000 men and 30 guns; *Lee's* were between 9,000 and 10,000. (W. B. Wo.)

**BULLY**, originally a fine, swaggering fellow, as in "Bully Bottom" in *A Midsummer Night's Dream*; later an overbearing ruffian, especially a coward who abuses his strength by ill-treating the weak; more technically a *souteneur*, a man who lives on the earnings of a prostitute. The term in its early use of "fine" or "splendid" survives in American slang.

**BULOM**, a people similar to the Timne, whose language is more nearly related to that of the Krim and the Kissi, living in the district between Freetown and Sherbro in Sierra Leone.

See N. W. Thomas, *Anthropological Report on Sierra Leone* (1916).

**BÜLOW, BERNHARD**, PRINCE VON (1849-1929), was born at Flottbek on the lower Elbe on May 3, 1849, of a distinguished family. His father, Bernhard Ernst von Bülow, had begun his career in the service of Denmark, of which State Holstein at that time still formed part. He represented the king of Denmark in his capacity of duke of Holstein in the Federal Diet at Frankfurt. Here he came into close contact with Bismarck, at that time Prussian representative, who formed a high opinion of his colleague's abilities. Later, he became minister president of Mecklenburg-Strelitz, and afterwards plenipotentiary for Mecklenburg in the Federal Diet; finally he was invited by Bismarck to enter the service of the German empire, and appointed secretary of State for foreign affairs in 1873. He died on Oct. 20, 1879. The prince's mother came of a Hamburg merchant family of the name of Rücker.

**Early Years and Upbringing.**—Bülow passed his early youth at Flottbek and Frankfurt-am-Main, attended the gymnasium there and in Neustrelitz, and completed his school years at Halle, where he passed his final examinations. He then studied law in Leipzig, Berlin and Lausanne. He fought as a volunteer in the Franco-German War of 1870. On his return he graduated at the bar and was then employed for a short time in Metz, at first in the Landgericht and afterwards in an administrative capacity.

In 1874 Bülow determined to enter diplomacy. His first appointment was as attaché to the Embassy in Rome, under Herr von Keudell. After gaining first experience for his future career here and in St. Petersburg, he was transferred in 1877 to Vienna as second secretary. During the great eastern crisis of that year he acted for a time as Charge d'Affaires in Athens and took part in the negotiations at the Congress of Berlin in 1878. In the following year he became second secretary to the Embassy in Paris. Here he remained six years, being transferred to St. Petersburg in 1885 as councillor of Embassy. Here he married a lady of a noble Italian family, a Princess Camporeale by birth, whose mother had contracted a second marriage with the Italian minister, Minghetti. Three years later Bülow received his first independent diplomatic post as minister in Bucharest. In 1894 he was transferred from this modest sphere to the Embassy in Rome, one of the most important posts of German diplomacy. His connections with Italy through his wife seemed to fit him particularly well to represent Germany there. He remained, however, only three years in this post, being appointed in July 1897 acting head of the Foreign Office in Berlin.

Since Bismarck's dismissal, Freiherr von Marschall had been in charge of the Foreign Office. He was not a professional diplomat, and was hardly equal to the difficult situation which confronted him after Bismarck's departure. In 1897 he exchanged his post for that of German Ambassador in Constantinople. A substitute for him had to be found, and Baron von Holstein, at that time the most influential figure in the Foreign Office, drew the attention of the chancellor, Prince Hohenlohe, to Bülow. He had been acquainted with him personally for some time and believed him to be the man best fitted by his polished manners, his tact, and his brain to cope with the difficult task of handling the emperor. Besides this, he certainly hoped that his own personal relations with Bülow would keep his influence predominant during the latter's tenure of office.

**Bülow's Personality.**—In the autumn of 1897, Bülow was definitely appointed secretary of state for foreign affairs. Three years later, in 1900, he also became imperial chancellor, and thus assumed the position previously held by Bismarck. He always looked on that great statesman, whom he had known personally and revered from his youth upwards, as his model, and often said so in his speeches and writings. He found the essence of his political theory in the doctrine that a state should be guided only by its own interests, and at times went so far as to deny altogether the applicability of any ethical standard in politics, e.g., in his judgment of the Boer War. But, however truly he remained Bismarck's pupil in his general ideas, between him and his great predecessor lay a profound difference, which was inherent in the innermost depths of his personality. Bülow was undoubtedly an

acute and dispassionate observer and a man of extraordinary diplomatic skill in the conduct of negotiations, both with the representatives of foreign Powers and with the party leaders in Germany itself; he was a brilliant parliamentary speaker, not so powerful and enthralling as Bismarck, but always subtle, cultivated, and witty. What he lacked, however, was the deep political passion which animated Bismarck. He was always, primarily, the cool, imperturbable man of the world, rather sceptical, rather ironical, an artist in treating of the most difficult matters in a light, conversational tone; but he lacked the strength to stake his whole personality at the critical moment for the course which he saw to be right. If his amiable character and the charm of his cultivated and adaptable nature enabled him to maintain his influence over the emperor for a decade, his confidence in the ultimate effect of these qualities also led him to avoid a definite decision when he feared that it would go against him, in the hope that by appearing to yield he would be able to get his way after all, gradually and almost imperceptibly. He was an excellent diplomat, but too essentially a diplomat to be a really great statesman. In questions of domestic politics, particularly, he always relied on his skill in temporizing and compromising without holding a definite and individual attitude towards the great questions of statecraft.

**Situations and Problems on Assumption of Office.**—The situation as Bülow found it on assuming office was as follows: After Bismarck's successor, Caprivi, had refused to renew the "reinsurance treaty" with Russia, the Russo-French treaty had been concluded; this threatened Germany with the potential danger of a simultaneous war on two fronts, the east and the west. Caprivi and Marschall had believed the best safeguard against this danger to lie in the expansion and the maintenance at all costs of the Triple Alliance. They had, however, endeavoured at the same time to cultivate good relations between the Triple Alliance and England. In this they had been unsuccessful, since the British Government of that time was averse to making any treaty commitments in their foreign policy. Relations with England had actually grown worse, partly owing to colonial disputes, and at the time of the Jameson raid in the Transvaal and the Krüger telegram there had even been danger of a breach of diplomatic relations. At this period the emperor had become finally convinced that Germany needed a strong battle fleet if she was to keep her colonial empire and defend her coasts and her commerce in an emergency against England. Admiral von Tirpitz had been appointed head of the imperial naval ministry for this purpose about the same time as Bülow took over the Foreign Office. Tirpitz proposed to create so strong a battle fleet as to make war with Germany a very risky matter, even for England, the leading sea power. The emperor embraced this idea with enthusiasm. It became one of the few absolutely unalterable principles of his foreign policy. The great question was whether it would be possible to attain this end without forcing England into the camp of Germany's opponents. If this happened, if England adhered in any form to the Russo-French alliance, then the danger of the international situation must increase enormously for Germany. Bülow himself was never convinced of Germany's need for a strong navy; he would have preferred to concentrate on improved coast defence and on submarines. But he could not ignore the fact that the emperor thought otherwise, and that he would be unable to prevent the execution of this programme. Under the circumstances, he felt it his duty to carry on the policy of maintaining and strengthening the Triple Alliance and to see that Germany's naval programme did not injure relations with England. He was always convinced that Germany needed peace, in the interests of her economic development, and had nothing to gain from a war. It was the more important to preserve the good relations with England on which the maintenance of peace depended.

**Bülow and the Negotiations for a Treaty with England.**

—In the spring of 1898 an attempt was made by England to reach a closer understanding with Germany. It was prompted by the situation of the British Empire at that time; its principal author was Joseph Chamberlain, the colonial secretary in Lord Salis-

bury's cabinet. Chamberlain became more and more convinced that England could not remain in her present isolation; that in view of the increased tension with Russia in the Far East and the absorption for a considerable period of all her own forces by the Boer War, she must seek the support of other Powers. He wished to begin by attempting an understanding with Germany, but from the first envisaged the possibility of a rapprochement with France and Russia even at the cost of some sacrifices should the German alliance prove impracticable. The first tentative suggestions in Berlin crystallized later into a proposal that a defensive alliance should be concluded which should come into force if either Germany or Great Britain were attacked by two great Powers. Bülow was now confronted with a decision of extraordinary difficulty. The whole tendency of his policy would have favoured acceptance of this suggestion, and an attempt, at least, to see whether peace could not be permanently ensured by this method without sacrifice of Germany's interest. The emperor was also at first very much inclined to agree to the English rapprochement. The last decision in this important question was taken by Baron von Holstein, for whose judgment Bülow had the greatest possible respect.

Holstein entertained the strongest mistrust of England's intentions. He believed that England was only interested in involving Germany in a struggle with Russia, thus to be quit of this dangerous opponent without risk to herself. He also thought that the advantages would be too unequal because Germany would have to help in defending the whole British Empire in all quarters of the globe, while England would only have to cover the much smaller and less threatened area of German possessions. Finally, he thought that England would not feel herself bound to support Germany in virtue of such an alliance if Germany found herself compelled, in virtue of her alliance with Austria-Hungary, to declare war on Russia in the event of a Russian attack against the Danube monarchy. For these reasons he found the proposal unacceptable in its existing form and thought it necessary to demand that Austria be included in the alliance and that its permanent validity should be ensured by ratification through the British Parliament. It is impossible to say whether Bülow entertained similar doubts from the first, or whether they were only evoked in him by Holstein's representations. It is only certain that he ended by adopting this chain of reasoning completely and basing his policy accordingly. It was probably due again to Holstein's advice that he conceived the plan of taking advantage of England's desire for a rapprochement to extract certain colonial concessions for Germany. He did not, therefore, reject the English offer unconditionally, but temporized, letting England hope that the plan might come to something after all. The negotiations dragged on for over two years. When, however, the British Government saw that Germany would not renounce her conditions, in particular the inclusion of Austria, they gave up the plan as hopeless and began to attempt to reach an understanding with Russia and France. The course of these negotiations was of decisive importance, not only for relations between England and Germany, but for the whole development of international relationships during the next decades. For the consequence of the rapprochement of England with France and Russia which now began was the conclusion of the entente between those three States and therewith the genesis of the situation which ended in the World War. Bülow and Holstein did not indeed foresee that their attitude would have such results. They believed that an English understanding with France and Russia would be wholly impossible, on account of the profoundly different views on international politics entertained by these States; they hoped that when England had seen the impossibility of such an enterprise she would approach Germany afresh and then be ready to accept her conditions. This misapprehension of the actual situation shows that they lacked that eye for the true relative relations of the different Powers which is so absolutely essential for any successful policy.

**Bülow and the Morocco Question (1905).**—Even after the failure of the negotiations for an Anglo-German alliance and the conclusion of the treaty between England and France in the spring of 1904, defining their respective spheres of influence in

Africa, the situation for Germany was not so unfavourable as it was ten years later. Relations between England and France were still far from close, and acute differences still existed between England and Russia. It was only Germany's attitude during the first Morocco crisis of 1905 that altered the situation to her disadvantage. Under the above-mentioned Franco-British agreement, Morocco had been assigned to the French sphere of influence and the French began immediately to pave the way for the gradual subjection of Morocco to their suzerainty. As this grew more and more apparent during the first months of 1905 Bülow determined to intervene. The decisive advice again came from Baron von Holstein. In his opinion, Germany, in the interests of her international prestige, should not permit the partition of hitherto independent territories between the other colonial Powers without receiving compensation. Bülow, who but a short time before had declared that Germany had no political interests of her own in Morocco, let himself be persuaded by Holstein to oppose France's action. The moment seemed propitious; the outbreak of the Russo-Japanese War in the Far East had wholly engaged the forces of France's ally, Russia, for a considerable time, and the domestic situation in France at the moment was extremely difficult. Bülow persuaded the emperor to land in Tangier in April 1905 in the course of his Mediterranean cruise and there to declare in an address to the representatives of the Sultan of Morocco that he looked on Morocco as an entirely independent country, in which no European power enjoyed special rights of any sort. The emperor only took this step with great reluctance, and afterwards repeatedly declared that he had done so only at Bülow's urgent desire.

The first result of this step was that France approached Germany with a request to formulate her counter-demands in return for leaving Morocco to France. It is doubtful whether an agreement could have been reached on this basis. Germany, however, was not so much interested in herself acquiring a part of Morocco or compensation in the French colonial area, as in preventing France from effecting this increase of her African possessions. Bülow therefore refused to negotiate on this basis and demanded the dismissal of Delcassé, the French foreign minister, who was supposed to be particularly anti-German, and also the convocation of an international conference to regulate the Moroccan question on the basis of political independence for Morocco and complete equality of footing in economic matters for all European Powers. France agreed to these demands with the greatest reluctance and felt herself deeply humiliated. These incidents also further damaged Germany's relations with England. England felt bound, having expressly recognized Morocco as within the French sphere of influence, to support France should she become involved in a conflict with Germany over this question. Although no definite offer of military assistance was made by England at that time, it can hardly be doubted that England would have taken France's side had war broken out then. And as it was probable that similar conflicts would again arise over the Moroccan question, it was agreed, on the initiative of the French Government, that representatives of the British and French military and naval general staffs should meet and discuss methods of co-operation between the two Powers in the event of a possible conflict with Germany. The result was that, although no treaty change was made, the ties between the two western Powers were drawn much closer than previously.

The conference met in Algieras at the beginning of 1906 but took quite a different course from that expected by Bülow. With the help of England and Russia, France secured the grant to herself of extensive privileges both in the organization of the Moroccan police and in financial and economic respects in the territory in question, although the nominal independence of Morocco was upheld. Germany was obliged to accept these resolutions, unless she were willing to accept the sole blame in the eyes of Europe for a breakdown of the conference, with all the disastrous consequences to which this might have given rise. The grave failure of the German policy led to the dismissal of Baron Holstein; he remained, however, in close relations with Bülow, who often consulted him.

**Bülow and the Treaty of Björkö (1905).**—While the Morocco negotiations were still in progress, the great war in the Far East had come to an end. Russia had been completely defeated. When the Tsar met Emperor William II. in Finland in July 1905, he was so broken down by this failure that he agreed to a proposal of the German emperor which he had rejected, on the advice of his ministers, in the previous autumn. The German emperor felt that the victory of the Japanese, who were England's allies, had increased the power of Great Britain to such an extent as to necessitate a coalition of all great Powers on the continent of Europe against her. The idea of such a continental league had been broached by him before and, strangely enough, had been approved by Bülow. It is hard to see how it could have been effected, in view of the existing tension between Germany and France. Starting with this idea, the emperor laid a draft treaty before the Tsar in Björkö which provided as a first step for a close offensive and defensive alliance between Germany and Russia, the Tsar undertaking further to attempt to persuade France to adhere to this alliance. Bülow agreed with this move of the emperor's and had even transmitted to him by wire the text of the first proposed draft. After the Tsar had signed the treaty, however, Bülow utilized the pretext that the emperor had changed a few words in the text transmitted to him to declare that he could no longer assume responsibility for the conduct of German policy if the emperor took decisions in important questions without previously consulting him. The emperor, who looked on the fact that he had persuaded the Tsar to sign the treaty of Björkö as a great success and a great personal achievement of his own, was absolutely disconcerted by Bülow's totally unexpected threat of resignation. He begged him to remain in office and not to desert him. Bülow remained, after exacting from the emperor a promise to take no important political decision in the future without consulting him.

The treaty of Björkö itself remained without serious consequences, because the Tsar, when enlightened by his ministers on his return to St. Petersburg as to the extent of the obligations he had undertaken, refused to acknowledge it as binding. Yet this incident had its importance as casting a vivid light on Bülow's relations with the emperor. In the first years of his chancellorship, Bülow had often had to temporize; but now he obviously felt that the time was come when he would be able to restrict the emperor's influence in politics within much narrower limits. He took advantage of an incident, unimportant in itself, to raise the question of confidence and demand an assurance from the emperor. The success which he had scored by this action was, however, only temporary. In reality, his position after this incident was less safe than before. The emperor, who had hitherto felt a personal attachment to this always pleasant-mannered and (on the surface) very accommodating diplomat, now began to look on him as a secret enemy of his imperial authority and to turn away from him in his heart.

After the failure of the continental league, it was no longer possible to prevent Russia from becoming a party to the Anglo-French entente. Defeated in Asia, Russia was in any case obliged to give up her hopes of extending her power in North China and Central Asia; this left the way clear for an understanding with England and a delimitation of the rival spheres of influence in Asia. This was effected by the treaty of Aug. 31, 1907. From this time on the combination of France, England and Russia in a closely-allied group of Powers was complete, while through the Anglo-Japanese alliance the group enjoyed further special support outside Europe.

Bülow followed this development with the gravest concern. He saw that this division of Europe into two groups of Powers, the Entente on the one hand, the Triple Alliance on the other, involved a grave danger for the peace of the world, since any conflict between two members of the group must draw in their allies, and might easily develop into a trial of strength between the rival coalitions. He had already discussed the danger of an encirclement of Germany in his speech before the Reichstag on Nov. 5, 1906. Events were soon to occur which cast a vivid light on the difficulties of the new situation.

**Bülow and Russia; Balkan Questions.**—After abandoning her policy of expansion in the Far East, Russia again devoted more interest than had been the case for some decades to Balkan problems. In particular, she encouraged Serbia's efforts to found a great southern Slav State to embrace Bosnia and the Herzegovina. As these ambitions could not be realized without a conflict with Austria, new and grave complications were to be foreseen here. The outbreak of the conflict was accelerated by the Young Turk revolution in the summer of 1908, which threatened to shatter the whole frame-work of the Ottoman empire. The prince of Bulgaria took advantage of this opportunity to repudiate the suzerainty of Turkey and declare himself independent, and at the same time Austria formally incorporated Bosnia and the Herzegovina into her dominions, these two provinces having previously been legally part of the Ottoman empire, occupied by Austria in virtue of the decisions of the Congress of Berlin. These two events aroused the most violent excitement in Serbia, and for a time it looked as though it would come to war between Austria and Serbia. As Russia felt that her prestige among the Balkan peoples obliged her to support the cause of Serbia, the crisis might easily have led to a conflict between Austria and Russia, which would most probably have resulted in war between the Triple Entente and the Triple Alliance. If this was averted, it was due solely to the fact that Russia, after her severe defeat in the Far East, combined with the internal unrest which had followed it, was not ready for war at that moment. Bülow gave the Russian Government clearly to understand that Germany would throw her whole forces on the side of Austria if such a war broke out, and summoned Russia to recognize without reservation Austria's annexation of Bosnia. Russia was forced to give the required declaration, but felt the humiliation deeply, and was much offended by the interference of the German Government. It would indeed have been wiser to leave Russia to find out for herself an acceptable form of withdrawal, since in any case she would have had to withdraw. As it was, the Russian Government was able to advance the pretext to the world at large that they had to submit to the German group. Thus, although this crisis ended with an apparent victory for Germany and Austria, it made the general situation still more acute and brought grist to the mills of the growing anti-German party in Russia. During this Balkan crisis, when there seemed a danger of a European war, the emperor insisted that at least the points of friction with France should be reduced to a minimum. Largely at his wish, Bülow consented to conclude a new Morocco agreement with France on Feb. 9, 1909, expressly recognizing France's political rights in Morocco. One may, indeed, doubt whether this concession would have kept France from intervention if war had broken out at the time.

**Bülow and England.**—Bülow was quite aware that the situation would become extremely dangerous as soon as Russia had recovered from the consequences of her defeat and had regained sufficient strength to participate in a war. He therefore considered his most important task to be the re-establishment of better relations with England. Meanwhile, however, the expansion of the German navy according to Admiral Tirpitz's programme had begun, and had awakened much concern in England. As England had, in 1906, introduced a new type of battleship far superior in fighting force to any earlier models, all old ships seemed to have lost their value, and the fighting force of a fleet now depended, apparently, solely on its strength in these new great battleships. The superiority of Great Britain's fighting fleet, hitherto unquestioned, thus became doubtful; her lead over the other Powers in the construction of these new battleships being comparatively small. She feared that if Germany expanded her fleet according to Tirpitz's programme she would in a few years have a fleet almost as large as the British, unless Britain made enormous efforts to expand her own fleet much more quickly than had been intended. These considerations were responsible for several suggestions from British quarters that Britain and Germany might possibly be able to reach an understanding on the number of battleships to be built by each State during the course of the next few years.

A great difference of opinion soon arose on this question between the emperor and Tirpitz on the one hand and Bülow on the other. The emperor and Tirpitz held that Germany's naval armaments must be determined exclusively by her own needs and interests, and that any interference by foreign Powers in these questions should be categorically repudiated. Bülow, on the other hand, was inclined to accept an arrangement such as that suggested and in certain circumstances to modify the German navy law, conditional on a political rapprochement between Great Britain and Germany, to be expressed in a treaty guaranteeing to Germany Britain's neutrality in case of a war with France. A very violent dispute took place between Bülow and the emperor, who sent word to the chancellor that he must resign office unless he declared openly for the principle that no modification of the German naval programme was admissible in any circumstances. Bülow hesitated to insist on his opinion, in view of the possible consequences, preferring to make a declaration satisfactory to the emperor, but indubitably not in full accordance with his own views. Hereby he put himself in a false position. The desire to extricate himself was perhaps not without its effect in the event which followed immediately afterwards and caused the greatest sensation throughout the world.

#### Bülow and the "Daily Telegraph" Interview (1908).—

On Oct. 27, 1908, the *Daily Telegraph* printed an interview by Col. Stuart Worseley with the emperor, secured during the latter's recent visit to England. According to the paper, the emperor had laid especial stress on his friendly feelings towards England; and among the various proofs which he adduced, he included the advice which he had given during the Boer War. It might appear as though he wished to arouse the impression that it was only by following this advice that Great Britain had carried the war to a successful close. The manuscript of this article was submitted by its author before publication to the emperor, and by him to the German foreign office for approval. The chancellor was away at Norderney, and it was forwarded on to him, but by an oversight (as he afterwards declared) he failed to read it; consequently no objections were raised, and it was allowed to appear. As its appearance evoked great indignation in England, the question as to the responsibility for allowing the interview to be published was raised in Germany. A question was asked in the Reichstag, and in the ensuing debate violent attacks were made on the emperor for his personal interference in politics. Bülow excused his conduct as stated above, but at the same time tendered his resignation, which he withdrew only after the emperor had repeated his promise not to take any step of political importance without the chancellor's advice. The emperor always believed that Bülow had actually read the article and allowed it to be published with the deliberate intention of exploiting the public excitement, which he foresaw, to put pressure on his master, whom he had attempted by this means to force into submission.

At all events, after this incident Bülow felt his position secure enough to join issue with Tirpitz on the naval programme and relations with England. On Nov. 30, 1908, he asked Tirpitz officially whether he considered Germany's defensive preparations against possible attack from Great Britain to be sufficient. Tirpitz replied that they were not, and that was his very reason for considering the construction of as strong a navy as possible to be indispensable. He added that he could not take the responsibility for retarding the programme, and must offer his resignation were this attempted. Bülow again abandoned the execution of his idea, partly perhaps because the reports from the German ambassador in London had not given him sufficient assurance that Britain would accord the desired political rapprochement in return for a modification of the German naval programme. Nevertheless, he never abandoned the idea of bringing about such a rapprochement so long as he remained chancellor; it is impossible to say whether he would have come nearer than his successor to its practical realization had he remained longer in office.

**Domestic Politics.**—In domestic politics Bülow was deficient in exact knowledge on economic questions and of the individual branches of the administration. He was mainly interested in foreign policy; domestic questions he generally left to his colleagues.

In this field there was only one broad principle which he attempted to establish. His latter years of office were notable for his effort to bring about a new and permanent grouping of the parties. The steadily increasing hostility between the social democrats on the one hand and the parties of the right (conservatives and national liberals) on the other, had in recent years resulted in giving increasing influence to the catholic party of the centre. The centre took advantage of this position to sell its consent to the Government's various measures in return for concessions in ecclesiastical or educational questions, or personal advantages. Bülow had long chafed under this situation. When the centre defeated the Government's budget for colonial development in the winter of 1906-7, because in its opinion catholic interests were not sufficiently considered in colonial policy, Bülow dissolved the Reichstag. The composition of the new Reichstag after the elections enabled him to unite all elements outside the centre and the social democrats in a coalition. This "Bülow bloc," as it was commonly called, included not only the old cartel parties of Bismarck's day (the conservatives and national liberals) but also the left-wing liberals and democrats united in the progressive people's party. Bülow hoped to find in this coalition a firm support for his whole policy. This hope proved, however, delusive. The incompatibility of views between the right and left wings of the bloc was much too great; this was apparent for example, in the different attitude of the conservatives and the progressives towards the question of the extension of the Prussian franchise. As Bülow himself had no definite programme in domestic policy on which to unite the parties of his bloc this loose coalition was in danger of breaking up every moment, and incessant wearisome negotiations were necessary to keep it together after a fashion. It finally broke up over the question of fiscal reform.

**Resignation.**—The Budget brought in by the Government in 1909 included, besides a number of indirect taxes, an imperial succession duty. The conservatives declared against the latter, while the liberals objected to some of the indirect taxes. Bülow informed the conservatives that he would resign if they threw out the budget, and broke up the bloc by rejecting the succession duty. They rejected it none the less, and Bülow handed in his resignation, which was accepted by the emperor on July 14, 1909. William II.'s confidence in Bülow had long been shaken, and he was not sorry to see him leave office. Bülow himself felt it impossible to remain chancellor if he could reckon neither on the monarch's confidence nor on a secure majority in the Reichstag. Bülow's public career seemed at an end. He retired altogether into private life, and never expressed an opinion in public regarding current political questions. He departed from this rule only once when the publishers of *Deutschland unter Kaiser Wilhelm II.*, a compilation by various hands, to be published in commemoration of the 25th year of William II.'s reign, asked him to write the account of foreign policy for this book. This he did, afterwards reprinting his contribution in book form under the title *Deutsche Politik*. In it he concerned himself chiefly with justifying his own conduct of foreign policy, but was of course obliged to speak with great reserve, as all diplomatic details of the period under review were still kept strictly secret. His account therefore contributes but little to our real knowledge of events.

**The War.**—Quite unexpectedly, Prince Bülow was brought into public life once more on the outbreak of the World War. Italy preserved neutrality in the summer of 1914. Although not recognizing any obligation under the terms of the Triple Alliance to join Germany and Austria, neither did she immediately make common cause with the Entente. As the German Government was always obliged to reckon with the possibility that she would yet do so, it determined to beg Prince Bülow to take over the post of German ambassador in Rome, which he had already held once, and attempt to bring over Italy after all to the side of the Central Powers. Bülow went to Rome in Dec. 1914. He hoped to persuade Austria to agree to cede the Trentino to Italy, and thus prevent Italy from joining the enemy camp. It took long, however, to persuade the Austrian statesmen to consent to this concession: and when they did so, at last, it was too late.

The impression was prevalent in Rome that Austria, under pressure from Germany, would in her hour of need give the promise but would make difficulties about fulfilling it after the Central Powers had proved victorious. In spite of all his efforts, Prince Bülow was unable to dispel Italy's mistrust of the sincerity of Austrian policy, or to prevent her entering the ranks of Austria's and Germany's enemies in May 1915. He probably doubted from the first whether anything could be achieved in Rome, but thought it his duty not to refuse his services for the last attempt.

**After the War.**—After the summer of 1915 Prince Bülow lived in quiet retirement, mostly in Klein-Flottbek; his public utterances were very few indeed. The most interesting of them was his letter to the editor of the *Hamburger Fremdenblatt*, printed in that journal on Aug. 4, 1919. Here Bülow expressed his views on the policy of his successor, Bethmann-Hollweg, and on the events which led up to the World War. He was concerned particularly to defend himself against the statement made by Bethmann-Hollweg in his recollections that the international situation in the summer of 1909, when he succeeded Bülow, was already so involved that no issue could be found, and that the World War had thus really been already inevitable. Bülow protested, and certainly rightly, against this "theory of fatality," as he called it. It is, however, undeniable that Prince Bülow's policy was largely responsible for bringing about the difficult situation in which Germany found herself in the decade preceding the World War. He died at Rome on Oct. 28, 1929.

**BÜLOW, BERNHARD ERNST VON** (1815-1879), Danish and German statesman, was the son of Adolf von Bülow, a Danish official, and was born at Cismar, Holstein, on Aug. 2, 1815. He studied law at Berlin, Göttingen and Kiel, and began his political career in the service of Denmark, in the chancery of Schleswig-Holstein-Lauenburg at Copenhagen, and afterwards in the foreign office. In 1842 he became councillor of legation, and in 1847 Danish *chargé d'affaires* in the Hanse towns. In 1850 he was sent to represent the duchies of Schleswig and Holstein at the restored federal diet of Frankfurt. Here he came into intimate touch with Bismarck, who admired his statesmanlike handling of the growing complications of the Schleswig-Holstein Question. With the radical "Eider-Dane" party he was utterly out of sympathy; and when, in 1862, this party gained the upper hand, he was recalled from Frankfurt. He now entered the service of the grand duke of Mecklenburg-Strelitz, and remained at the head of the grand-ducal government until 1867, when he became plenipotentiary for the two Mecklenburg duchies in the council of the German Confederation (Bundesrat), where he defended the mediaeval constitution of the duchies against Liberal attacks. In 1873 Bismarck persuaded him to enter the service of Prussia as secretary of state for foreign affairs. In 1875 he was appointed Prussian plenipotentiary in the Bundesrat; in 1877 he became Bismarck's lieutenant in the secretaryship for foreign affairs of the Empire; and in 1878 he was, with Bismarck and Hohenlohe, Prussian plenipotentiary at the congress of Berlin. He died at Frankfurt on Oct. 20, 1879. Of his six sons the eldest, Bernhard Heinrich Karl (*see above*), became chancellor of the Empire.

**BÜLOW, DIETRICH HEINRICH, FREIHERR VON** (1757-1807), Prussian soldier and military writer, and brother of General Count F. W. Bülow; entered the Prussian army in 1773 and remained in the service for 16 years. He wrote *Geist des Neueren Kriegssystems* (Hamburg, 1799; revised ed., 1805) and *Der Feldzug 1800* (1801), *Lehrsätze des Neueren Kriegs* (1805), *Geschichte des Prinzen Heinrich von Preussen* (1805), *Neue Taktik der Neuern wie sie sein sollte* (1805), and *Der Feldzug 1805*

(1806). He also edited, with G. H. von Behrenhorst (1733-1814) and others, *Annalen des Krieges* (1806). These brilliant but unorthodox works, distinguished by an open contempt of the Prussian system, cosmopolitanism hardly to be distinguished from high treason, and the mordant sarcasm of a disappointed man, brought upon Bülow the enmity of the official classes and of the Government. He was arrested as insane, but medical examination proved him sane and he was then lodged as a prisoner in Colberg, where he was harshly treated, though Gneisenau obtained some mitigation of his condition. Thence he passed into Russian hands and died in prison at Riga in 1807, probably as a result of ill-treatment.

Bülow has often been styled the "father of Modern tactics." His early training had shown him merely the pedantic *minutiae* of Frederick's methods, and, in the absence of any troops capable of illustrating the real linear tactics, he became an enthusiastic supporter of the methods, which (more of necessity than from judgment) the French revolutionary generals had adopted, of fighting in small columns covered by skirmishers. Battles, he maintained, were won by skirmishers. "We must organize disorder," he said; indeed, every argument of writers of the modern "extended order" school is to be found *mutatis mutandis* in Bülow, whose system acquired great prominence in view of the mechanical improvements in armament. But his tactics, like his strategy, were vitiated by his absence of "friction," and their dependence on the realization of an unattainable standard of bravery.

Bülow*, also *Vermischte Schriften aus dem Nachlass von Behrenhorst* (1845); Ed. von Bülow and von Rüstow, *Militärische und vermischte Schriften von Heinrich Dietrich v. Bulow* (1853).

**BÜLOW, FRIEDRICH WILHELM, FREIHERR VON**, count of Dennewitz (1755-1816), Prussian general, was born on Feb. 16, 1755, at Falkenberg in the Altmark; he was the elder brother of D. H. Bülow (*q.v.*). He entered the Prussian army in 1768. In 1792 he was made military instructor to the young prince Louis Ferdinand, and accompanied the prince in the campaigns of 1792-93-94 on the Rhine. The disasters of the campaign against Napoleon in 1806 aroused his energies. He did excellent service under Lestocq's command in the latter part of the war, was wounded in action, and finally designated for a brigade command in Blücher's force. He was governor-general of East and West Prussia in 1812, and defended the marches in 1813, fought at Möckern, took Halle, and defended Berlin against Oudinot by his victory at Lückau. In the summer of 1813 he was placed under the command of Bernadotte, crown prince of Sweden. Bülow commanded a corps in the battle of Grossbeeren, defeated Ney at Dennewitz, played a part in the overthrow of Napoleon at Leipzig, and was then entrusted with the task of evicting the French from Holland and Belgium. He won a signal victory at Hoogstraaten, and in the campaign of 1814 he invaded France from the north-west, joined Blücher, and took part in the brilliant victory of Laon in March. He was next made general of infantry and received the title of Count Bülow von Dennewitz. In the short peace of 1814-15 he was at Königsberg as commander-in-chief in Prussia proper. He was soon called to the field again, and in the Waterloo campaign commanded the IV. corps of Blücher's army. He was not present at Ligny, but his corps headed the flank attack upon Napoleon at Waterloo, and bore the heaviest part in the fighting of the Prussian troops. He took part in the invasion of France, but died suddenly on Feb. 25, 1816, a month after his return to the Königsberg command.

(Leipzig, 1876), and "Behrenhorst und Bülow" (*Historische Zeitschrift*, 1861, vi.); Max Jahns, *Geschichte der Kriegswissenschaften*, vol. iii., pp. 2133-2145 (Munich, 1891); General von Kämmerer (transl. Donat), *Development of Strategic Science* (1905).

**BÜLOW, HANS VON** (1830-1894), German pianist and conductor, was born at Dresden on Jan. 8, 1830, the son of Eduard von Bülow (1803-1858), a well-known author. He received his first lessons in pianoforte-playing from Friederich Wieck, the father of Clara Schumann, but there was no intention of his adopting music as a profession, and in due course he became a

law student at Leipzig, though he continued his musical studies, working at counterpoint under Moritz Hauptmann. In 1848 he was already an enthusiast for Wagner's work, and in 1849 was contributing to the *Abendpost* in Berlin (where he was continuing his legal studies) articles in support of his music and that of Liszt. In the years 1850-51 he studied in Zürich the art of conducting under Wagner himself. He then returned to Weimar to work at the pianoforte under Liszt, of whose style and school of playing he became in due course one of the leading exponents. In 1857 he married Liszt's brilliant daughter, Cosima. In the meantime, after two years at Weimar, he began to play in the chief musical centres in Central Europe. He then spent nine years (1855-64) in Berlin as professor of pianoforte playing at the Stern conservatorium, working also as a conductor and writing on musical subjects. In 1864, Wagner helped him to secure the positions of *Hofkapellmeister* to Louis II. of Bavaria and director of the royal school of music at Munich. There he conducted the historic first performances of *Tristan* and the *Meistersinger*. His intimacy with Wagner was now broken by the desertion of his wife Cosima, who left him to marry the composer, but his admiration and enthusiasm for Wagner's work remained unchanged in spite of the severance of their personal relations. After a long concert tour, Bülow settled as conductor at Hanover (1877-80), and then at Meiningen (1880-85). At Meiningen, where he made the orchestra one of the first in Europe, he married, in 1882, Marie Schanzer. From 1885 onwards he conducted in many centres in Russia, in Germany, and in England, and gave classes in pianoforte-playing at the Raff conservatorium in Frankfurt and the Klindworth school in Berlin. He went to live in Hamburg in 1888, though he still conducted the Philharmonic concerts in Berlin, and that year he made his last appearance in England. He died in Cairo on Feb. 13, 1894.

Bülow was a great artist, with complete intellectual mastery of the music he played or conducted. As a conductor he was perhaps greatest in Beethoven, but he was also a great exponent of contemporary music, of Wagner, Liszt, Tchaikovsky and Brahms. He had a remarkable musical memory, and had by heart practically all the pianoforte works of the great composers. His mastery of the content of the works of the masters made his editions, especially of the pianoforte works of Beethoven, of great value to students, though they have been criticized by some in respect of their arbitrariness and even inaccuracy. His own music has not lived, but among his more ambitious productions may be mentioned an orchestral work *Nirwana*, incidental music to *Julius Caesar*, and *Vier Charakterstücke für Orchester*.

**BIBLIOGRAPHY.**—*Briefe Bülows und ausgewählte Schriften* (vols. i. and ii. were translated into English by Constance Bache); see monographs by A. Steiner (1906), H. Riemann (1908), and R. du Moulin-Eckart (1921).

**BÜLOW, KARL VON** (1846-1921), German soldier, was born in Berlin March 24, 1846. Commissioned to the 2nd Guards regiment in 1864, he served in the campaign of 1866 and the Franco-Prussian War of 1870. After a distinguished career, he was placed in charge of the II. Army on the outbreak of the World War, and was at the head of the invasion of Belgium. During the subsequent advance into France, von Kluck's I. Army was also placed under his direction, a faulty arrangement soon abandoned, but not replaced by effective control from German headquarters. From this time the two armies were repeatedly taking divergent action, a confusion which ended in the retreat from the Marne. The responsibility for this strategic disaster was the subject of acute controversy, and public opinion in Germany was induced to fix the blame on von Bülow. But the view of the Supreme Army Command was shown by their placing von Kluck on the retired list and promoting von Bülow to field-marshal in Jan. 1915, and post-war knowledge has confirmed this verdict. In June 1916 von Bülow was, at his own request, placed on the retired list. He died in Berlin Aug. 31 1921.

**BULRUSH**, a name given in England to *Typha latifolia*, the reed-mace or club-rush, a plant growing in lakes, by edges of rivers and similar localities, with a creeping underground stem, narrow, nearly flat leaves, 3 to 6 ft. long, arranged in opposite

rows, and a tall stem ending in a cylindrical spike, half to one foot long, of closely packed male (above) and female (below) flowers. The familiar brown spike is a dense mass of minute one-seeded fruits, each on a long hair-like stalk and covered with long downy hairs, which render the fruits very light and readily carried by the wind. The name bulrush is more correctly applied to *Scirpus lacustris*, a member of a different family (Cyperaceae), a common plant in wet places, with tall spongy, usually leafless stems, bearing a tuft of many-flowered spikelets. The stems are used for matting, etc. In the United States the name bulrush is commonly given to species of *Scirpus*, especially *S. validus*, while species of *Typha* are usually called cat-tail. The bulrush of Scripture, associated with the hiding of Moses, was *Cyperus Papyrus*, which was abundant in the Nile.

**BULSTRODE, SIR RICHARD** (1610-1711), English author and soldier, is chiefly known by his *Memoirs and Reflections upon the Reign and Government of King Charles I. and King Charles II.*, published in 1721 after his death. He also wrote *Life of James II.* and *Original Letters written to the Earl of Arlington* (1712).

His second son, WHITELOCKE BULSTRODE (1650-1724), published *A Discourse of Natural Philosophy*, and was a prominent Protestant controversialist.

**BULWARK**, a barricade of beams, earth, etc. (possibly from *bole*, a tree-trunk, and *werk*, work; Ger. *Bollwerk*), a work in 15th and 16th century fortifications designed to mount artillery (see BOULEVARD). The term is used of the woodwork running round the ship above the level of the deck. Figuratively it means anything serving as a defence.

**BUMBLEBEE** or **HUMBLEBEE**, the common name for bees (*q.v.*), of the genus *Bombus*, which have a thick hairy body, often banded with bright colours. There are numerous species, found generally throughout the world except the Australian region, where, however, they have been introduced as their presence is necessary to fertilize some of the cultivated species of clover (see SOCIAL INSECTS, HYMENOPTERA).

**BUMBOAT**, a small boat which carries vegetables, provisions, etc., to ships lying in port or off the shore. The word is probably connected with the Dutch *bumboot* or *boomboot*, a broad Dutch fishing-boat, the derivation of which is either from *boom*, *cf.* Ger. *Baum*, a tree, or from *bon*, a place in which fish is kept alive, and *boot*, a boat. It appears first in English in the Trinity House by-laws of 1685 regulating the scavenging boats attending ships lying in the Thames.

**BUMBULUM, BOMBULUM** or **BUNIBULUM**, a musical instrument described in an apocryphal letter of St. Jerome to Dardanus. There is no evidence at all of such an instrument—described as consisting of an angular frame from which metal plates and small bells depended—having ever existed.

**BUMPERS:** see BUFFERS.

**BUN**, a small cake, usually sweet and round. In Scotland the word is used for a very rich spiced type of cake and in the north of Ireland for a round loaf of ordinary bread. The derivation of the word has been much disputed.

Like the Greeks, the Romans ate bread marked with a cross (possibly in allusion to the four quarters of the moon) at public sacrifices, such bread being usually purchased at the doors of the temple and taken in with them—a custom alluded to by St. Paul in I. Cor. x. 28. The cross-bread was eaten by the pagan Saxons in honour of Eoster, their goddess of light. The Mexicans and Peruvians are shown to have had a similar custom. The custom, in fact, was practically universal, and the early Church adroitly adopted the pagan practice, grafting it on to the Eucharist and so giving us the "hot-cross bun."

**BUNBURY, HENRY WILLIAM** (1750-1811), English caricaturist, second son of Sir William Bunbury, 5th baronet, of Mildenhall, Suffolk, was educated at Westminster School and St. Catharine's Hall, Cambridge, and soon showed a talent for drawing, and especially for humorous subjects. His caricatures are as famous as those of his contemporaries Rowlandson and Gillray, good examples being his "Country Club" (1788), "Barber's Shop" (1811) and "A Long Story" (1782). He was colonel of the West

Suffolk Militia, and was appointed equerry to the duke of York in 1787.

His son SIR HENRY EDWARD BUNBURY, Bart. (1778-1860), was a distinguished soldier, and rose to be a lieutenant-general; he was an active member of parliament, a pioneer of the volunteer movement and the author of several historical works of value, notably *Narrative of certain Passages in the late war with France* (1852), valuable for the light thrown on internal history just before the Peninsular War. His second son, SIR EDWARD HERBERT BUNBURY (1811-95), also a member of parliament, was well known as a geographer and archaeologist, and author of a *History of Ancient Geography* (1879) and a *Memoir* (1868) of his father.

**BUNBURY**, seaport and municipal town (Pop. about 5,000) situated on the south-west coast of Western Australia 90 m. S. of Fremantle and 115 m. (by rail) from Perth. The climate is equable and bracing (mean ann. temp.: 68°-54° F; av. ann. rainfall: about 38 in., mainly in winter). The bay (Koombana) on which it stands is open to the sea and the harbour is liable to silting. A granite mole and a timber jetty afford 5,000 ft. berthing space with railway facilities and depths of 15-27 ft. The hinterland of Bunbury is noted for its timber (mainly jarrah). The supplies of this are diminishing, but wheat, wool and fruit (mainly apples) are grown. Bunbury is also an outlet for a good deal of coal from the Collie field (40 m. by rail). It is the second port of Western Australia and has a considerable, but fluctuating, export trade in timber (about 150,000 tons per ann.), wheat, coal, wool and fruit amounting to about 280,000-290,000 tons (£1,000,000-£1,500,000) carried in about 320,000 tons of shipping.

**BUNCOMBE** or **BUNKUM** (from Buncombe county, N.C., U.S.A.), a term used for insincere political action or speaking to gain support or the favour of a constituency, and so any humbug or clap-trap. The phrase "to talk for (or to) Buncombe" arose in 1820, during the debate on the Missouri compromise in the U.S. Congress; the member for the district containing Buncombe county confessed that his long and much interrupted speech was only made because his electors expected it, and that he was "speaking for Buncombe."

**BUNCRANA**, market town and urban district of Co. Donegal, Ireland, on the Londonderry and Lough Swilly railway. Pop. (1926), 2,309. There is a trade in agricultural produce, a salmon fishery, sea fisheries and a manufacture of linen. The town is flanked on the east and south by hills exceeding 1,000 ft. The square keep of an ancient castle remains, but the present Bunrana Castle is a residence erected in 1717.

**BUNDABERG**, a municipal town and river port of Cook county, Queensland, Australia, 10 m. from the mouth of the river Burnett. Pop. (1926), 10,000. It lies on both sides of the river, and connection between the two ports is maintained by road and railway bridges. There are saw-mills, breweries, brickfields and distilleries in the town, and numerous sugar factories in the vicinity. The staple exports are sugar, golden-syrup and timber.

**BUNDELKHAND**, a tract of country in Central India, lying between the United and the Central Provinces. Historically it includes the British districts of Hamirpur, Jalaun, Jhansi and Banda, which now compose the Jhansi division of the United Provinces, but politically it is restricted to a collection of Indian States, under the Bundelkhand agency. There are nine States, the most important of which are Orchha, Panna, Samthar, Charkhari, Chhatarpur, Datia, Bijawar and Ajaigarh: there are also 13 small estates in the agency, and a *pargana* (Alampur) belonging to Indore. A garrison of all arms is stationed at Nowgong.

The surface of the country is uneven and hilly, except in the north-east part, which forms an irregular plain cut up by ravines. There are three ranges of hills, the Bindhachal, Panna and Bander chains, the highest elevation not exceeding 2,000 feet. The country is further diversified by isolated hills rising abruptly from a common level, and presenting from their steep and nearly inaccessible scarps eligible sites for castles and strongholds, whence the mountaineers of Bundelkhand have frequently set at defiance the most powerful of the Indian States. The general slope of the country is towards the north-east, as indicated by the course of the rivers which traverse or bound the territory, and finally dis-

charge themselves into the Jumna. The chief streams, enumerating them from the western boundary, are the Sind, Betwa, Ken, Baighin, Paisuni, Tons, Pahuj and Dhasan. They flow in deep ravine-fringed channels and are of little use for irrigation; though the waters of the Betwa have been impounded for an important canal. The main sources of irrigation are numerous artificial lakes, formed centuries ago by throwing massive embankments across drainage lines. Many of them, like Barwa Sagar near Jhansi, which is 2½ m. in diameter, are set in surroundings of singular natural beauty, and enhance the picturesque variety of the Bundelkhand landscape.

The people are almost as picturesque as their country. The true Bundela—the race which gives its name to the land—is generally impoverished and in debt; but he has an inextinguishable pride in his descent and a great aversion to hard work. In his raiment he displays an attractive sense of colour; and a touch of the swashbuckler is added to his mien by the velvet-sheathed *talwar* or other mediaeval weapon which he generally carries about with him. He is a keen sportsman, and the low jungle with which the country is covered abounds in game, tiger, leopard, hyena, wild boar, nilgai and antelope.

Diamonds are found over a considerable area of country, but particularly near Panna. The output in Akbar's time is said to have been worth £100,000 a year: and some fine specimens were obtained: a magnificent jewel from the Gadasia mine was among the treasures in Kalinjar fort. Though the quality is good, the size of the finds is now small. The diamonds lodge in a conglomerate, not unlike the diamondiferous rock of South Africa, but close to the surface, and they are worked in shallow irregular pits.

The earliest dynasty recorded to have ruled in Bundelkhand were the Gaharwars, who were succeeded by the Parihars. About A.D. 800 the Parihars are said to have been ousted by the Chandels, whose chief, Dangha Varma, appears to have established the earliest paramount power in Bundelkhand towards the close of the 10th century A.D. Under his dynasty the country attained its greatest splendour in the early part of the 11th century, when its rajah, whose dominions extended from the Jumna to the Nerbudda, marched at the head of 36,000 horse and 54,000 foot, with 640 elephants, to oppose the invasion of Mahmud of Ghazni. In 1182 the Chandel dynasty was overthrown by Prithwi Raj, the ruler of Ajmer and Delhi, after which the country remained in ruinous anarchy until the close of the 14th century, when the Bundelas, who are supposed to be a left-handed branch of either the Gaharwars or the Chandels, established themselves on the right bank of the Jumna. One of these took possession of Orchha by treacherously poisoning its chief; and his successor it was who assassinated the celebrated Abul Fazl, the prime minister and historian of Akbar. The struggles of the Bundelas for independence resulted in the withdrawal of the royal troops, and the admission of several petty States as feudatories of the empire on condition of military service. On the occasion of a Mohammedan invasion in 1732, Chhatar Sal asked and obtained the assistance of the Mahratta peshwa, whom he adopted as his son, giving him a third of his dominions. The Mahrattas gradually extended their influence over Bundelkhand, and in 1792 the peshwa was acknowledged as the lord paramount of the country. The Mahratta power was, however, on the decline; and by the treaty concluded between the peshwa and the British Government, the districts of Banda and Hamirpur were transferred to the latter. In 1809 Ajaigarh was besieged by a British force, and again three years later Kalinjar was besieged and taken after a heavy loss. In 1817, by the Treaty of Poona, the British Government acquired from the peshwa all his rights, interests and pretensions, feudal, territorial or pecuniary, in Bundelkhand. In carrying out the provisions of the treaty, an assurance was given by the British Government that the rights of those interested in the transfer should be scrupulously respected, and the host of petty principalities in the province is the best proof of the sincerity and good faith with which this clause has been carried out.

**BUNDI**, an Indian State in the Rajputana agency, lying on the north-east of the river Chambal, in a hilly tract historically known as Haraoti. It has an area of 2,220 sq. miles. Many parts

of the State are wild and hilly, inhabited by a large Mina population, formerly notorious as a race of robbers. Two rivers, the Chambal and the Mej, water the State. In 1921 the population was 187,068. The town of Bundi had a population in 1921 of 19,313. A school for boys of high rank was opened in 1897.

The State of Bundi was founded about A.D. 1342 by the Chohan rajput chief, Rao Dewa or Deoraj, who captured the town from the Minas. Its importance, however, dates from the time of Rao Surjan, who succeeded to the chieftainship in 1554 and by throwing in his lot with the Mohammedan emperors of Delhi (1569) received a considerable accession of territory. In the 17th century their power was curtailed by the division of Haraoti into the two States of Kotah and Bundi; but the title of maharao raja was conferred on Budh Singh for the part played by him in securing the imperial throne for Bahadur Shah I. after the death of Aurangzeb in 1707. In 1804 the maharao raja, Bishan Singh, gave valuable assistance to Col. Monson in his disastrous retreat before Holkar, and in 1818, by a treaty concluded with Bishan Singh, Bundi was taken under British protection. In 1821 Bishan Singh was succeeded by his son, Ram Singh, who ruled till 1889, and was known as "the most conservative prince in conservative Rajputana." His rule was popular and beneficent; and his son, the present maharao raja, continues the same traditions. He enjoys a salute of 17 guns.

**BUNER**, a valley on the Peshawar border of the North-west frontier province of India. It is a small mountain valley, dotted with villages and divided into seven sub-divisions. The Mora hills and the Ilam range divide it from Swat, the Sinawar range from Yusufzai, the Guru mountains from the Chamla valley, and the Duma range from the Puran valley. It is inhabited by the Niaszai and Malizai divisions of the Pathan tribe of Yusufzais, who are called after their country the Bunerwals. They are a powerful and warlike tribe, numbering 27,000 fighting men. The Umbeyla expedition of 1863, under Sir Neville Chamberlain, was occasioned by the Bunerwals siding with the Hindustani fanatics, who had settled down at Malka in their territory. In the end the Bunerwals were subdued by a force of 9,000 British troops, and Malka was destroyed, but they made so fierce a resistance, in particular in their attack upon the "Crag" picket, that the Indian medal with a clasp for "Umbeyla" was granted in 1869 to the troops taking part. The government of India refrained from interfering with the tribe again until the Buner campaign of 1897 under Sir Bindon Blood. Many Bunerwals took part in the attack of the Swatis on the Malakand fort, and a force of 3,000 British troops was sent to punish them; but the tribe speedily handed in the arms demanded of them and made complete submission.

**BUNGALOW**, the Anglo-Indian form of the vernacular name of the typical one-storied house lived in by Europeans in India. It is now generally used for houses of one story, or of low design giving this effect. A *dak* bungalow is a rest house provided in India by the public authorities for the use of travellers.

**BUNGAY**, urban district of East Suffolk, England; 113m. N.E. of London on a branch of the L.N.E.R. from Beccles. Pop. (1931) 3,098. It is placed in a deep bend of the river Waveney, the boundary with Norfolk. The parish church of St. Mary has a fine Perpendicular tower, and that of Holy Trinity a round tower of which the lower part is Norman. St. Mary's was attached to a Benedictine nunnery found in 1160. The castle, of which massive ruins remain, was a stronghold of the powerful family of Bigod, being granted to Roger Bigod, a Norman follower of the Conqueror, in 1075. A grammar school was founded in 1592. There are large printing-works, and a considerable carrying trade on the Waveney, in corn, flour and lime.

**BUNIN, IVAN ALEKSEYEVICH** (1870– ), Russian poet and novelist, was born Oct. 10, 1870, of noble family in Voronezh. His first poems were published in 1889. His poems were awarded the Pushkin prize, the highest academic distinction in Russia, and the same distinction was awarded to his translation of Longfellow's "Hiawatha." His other masterly translations from English poets include those of Byron's "Manfred" and "Cain," and of Tennyson's "Lady Godiva." In 1909 he was elected a member of the Russian Academy.

Bunin's poetry is mainly descriptive—not lyric—impassive, of classic simplicity and harmony, of jewelled perfection, minute observation and vivid perception of colour. He ranks highest, however, as a prose writer. The best known among his novels, tales and short stories are *The Village*, *A Gentleman from San Francisco*, *Suchodol*, *An Evening in the Spring*. The first two have been translated into English, as also *Dreams of Chang and other Stories*. There is much affinity in his novels with Turgeniev and Chekhov—but he might be best described as the Russian Flaubert. He is a great master of classic prose.

See Prince D. Svyatopolk-Mirsky, *Modern Russian Literature*, p. 96. (1925).

**BUNION**, an inflamed swelling of the sac containing synovial fluid on the metatarsal joint of the big toe, or, more rarely, of the little toe. This may be accompanied by corns or suppuration. The cause is prolonged compression of the toes in a narrow and pointed boot so that the great toe is deflected outwards instead of pointing directly forwards. Use of sufficiently wide footwear and palliative treatment by dressings, etc., are usually effective, but in obstinate cases a surgical operation may be considered.

**BUNKER HILL**, the name of a small hill in Charlestown, Boston (Mass.), U.S.A., famous as the scene of the first considerable engagement June 17, 1775, in the American Revolution (*q.v.*). Bunker Hill (110ft.) was connected by a ridge with Breed's Hill (75ft.), both being on a narrow peninsula a short distance to the north of Boston, joined by a causeway with the mainland. Since the affair of Lexington (April 19, 1775) General Gage, who commanded the British forces, had remained inactive at Boston awaiting reinforcements from England. The headquarters of the Americans were at Cambridge, with advanced posts occupying much of the 4m. separating Cambridge from Bunker Hill. When Gage received his reinforcements at the end of May, he determined to repair his strange neglect by which the hills on the peninsula had been allowed to remain unoccupied and unfortified. As soon as the Americans became aware of Gage's intention they determined to frustrate it, and accordingly, on the night of June 16, a force of about 1,200 men, under Colonel William Prescott and Maj.-General Israel Putnam, with some engineers and a few field-guns, occupied Breed's Hill (to which the name Bunker Hill is itself now popularly applied). When daylight disclosed their presence to the British they had already strongly entrenched their position. Gage lost no time in sending troops across from Boston with orders to assault. The British force, between 2,000 and 3,000 strong, under (Sir) William Howe, supported by artillery and by the guns of men-of-war and floating batteries stationed in the anchorage on either side of the peninsula, were fresh and well disciplined. The American force consisted for the most part of inexperienced volunteers, numbering about 1,500 men. The village of Charlestown, from which a galling musketry fire was directed against the British, was by General Howe's orders almost totally destroyed by hot shot during the attack. Instead of attempting to cut off the Americans by occupying the neck to the rear of their position, Gage ordered the advance to be made up the steep and difficult ascent facing the works on the hill. Whether or not in obedience (as tradition asserts) to an order to reserve fire until they could see the whites of their assailants' eyes, the American volunteers with admirable steadiness waited till the attack was on the point of being driven home, when they delivered a fire so sustained and deadly that the British line broke in disorder. A second assault, made like the first, with the precision and discipline of the parade-ground met the same fate, but Gage's troops had still spirit enough for a third assault, and this time they carried the position with the bayonet, capturing five pieces of ordnance and putting the enemy to flight. The loss of the British was 1,054 men killed and wounded, among whom were 89 commissioned officers; while the American casualties amounted to 420 killed and wounded, including General Joseph Warren, and 30 prisoners.

The significance of the battle of Bunker Hill is not, however, to be gauged by the losses on either side, heavy as they were in proportion to the numbers engaged, nor by its purely military results, but by its moral effect. "It roused at once the fierce

instinct of combat in America . . . and dispelled . . . the almost superstitious belief in the impossibility of encountering regular troops with hastily levied volunteers. . . . No one questioned the conspicuous gallantry with which the provincial troops had supported a long fire from the ships and awaited the charge of the enemy, and British soldiers had been twice driven back in disorder before their fire.<sup>1</sup> The pride which Americans naturally felt in such an achievement, and the self-confidence which it inspired, were increased when they learnt that the small force on Bunker Hill had not been properly reinforced, and that their ammunition was running short before they were dislodged from their position.<sup>2</sup> Had the character of the fighting on that day been other than it was; had the American volunteers been easily, and at the first assault, driven from their fortified position by the troops of George III., it is not impossible that the resistance to the British Government would have died out in the North American colonies through lack of confidence in their own power on the part of the colonists. Bunker Hill, whatever it may have to teach the student of war, taught the American colonists in 1775 that the odds against them in the enterprise in which they had embarked were not so overwhelming as to deny them all prospect of ultimate success.

Aniv. of Battle of Bunker Hill* (Boston, 1875); G. E. Ellis, *Hist. of Battle of Bunker's (Breed's) Hill* (Boston, 1875); S. Sweet, *Who was the Commander at Bunker Hill?* (Boston, 1850); W. E. H. Lecky, *History of England in the Eighteenth Century*, vol. iii. (1883); Sir George O. Trevelyan, *The American Revolution* (1899); Fortescue, *Hist. of the Brit. Army*, vol. iii. (1902). (C.)

**BUNKERING OF SHIPS.** Coal bunkering has naturally been in use ever since steamships came into existence. In the early days it was performed by hand, which was an extremely slow process. It is no uncommon sight to see, even to-day, gangs of from 50 to 150 men and women, carrying baskets of coal and handing them up the ship's side, see fig. 1; the output is 3 to 4 tons per carrier per day. Apart from the economic aspect, hand bunkering was not so bad when the loading and unloading of vessels was slow, but with modern devices for handling cargo, coal bunkering becomes a more important proposition.

Before discussing the different methods and devices in use, it must be mentioned that there are fundamental differences,

FIG. 1.—NATIVE MEN AND WOMEN COALING A SHIP AT ST. LUCIA, B.W.I. The coal is carried in baskets and tallied at the foot of the gangway by the coaling agent and a ship's officer

depending upon the particular port concerned, its traffic, and the nature of the fuel employed.

At the Welsh ports, at Liverpool and at ports on the Tyne and Humber, the coal loaded is almost exclusively cargo; it is all rail-borne, and is transferred from the sidings by huge steel structures on the quayside, known as coal hoists. By raising the trucks individually and tipping them, the coal is loaded by means of a telescopic chute. These coal hoists are also occasionally used at these ports for bunkering vessels. On the other hand, at ports

<sup>1</sup>W. E. H. Lecky, *History of England in the Eighteenth Century*, iii. 428.

<sup>2</sup>General Gage's despatch. *American Remembrancer* 1776, part II., p. 132.

where general cargo is principally handled, water-borne coal is almost exclusively used for bunkering purposes, because the quay space is too valuable for the provision of coal hoists. The coal is unloaded into barges, and then transferred by manual labour or mechanical devices into the bunkers of the steamers.

At the Victoria and Albert docks—which may be taken as a typical example—about 30% of the coal is still loaded by manual

FIG. 2.—DIAGRAM SHOWING THE "DE MAYO" SYSTEM OF BUNKERING. This device discharges coal from barges through the intake port hole either direct or, as shown, by conveyor to the bunkers

labour, while about 70% is mechanically bunkered. The former process is performed by winch barges by the "whip and skip" method. An average of 100 tons per day of 8 hours can thus be transferred by a gang of 9 men.

**Mechanical Bunkering Plants** may be divided under two heads:—

A.—Portable loading devices, self-contained, but with no supporting structure. They are attached temporarily to the ship to be coaled; and

B.—Floating loading devices mounted on pontoons.

A. The "De Mayo" bunkering device, which is more particularly used in America, is a completely enclosed bucket elevator, suspended singly, or in series, from ships' tackle or from the boom of a coaling barge; it discharges coal from barges alongside, both in and off shore, and at the intake port-hole. With this system, portable conveyors are sometimes employed for trimming the coal in the bunkers, or for loading through deck hatches in connection with an adjustable portable elevator. Such a combination is shown in fig. 2. This device is used in the Panama Canal for bunkering vessels which do not touch at the piers.

The "Michener" coaling elevator (see fig. 3) consists of a special type of bucket elevator, suspended from the side of the vessel, with the feeding end in the coal barge and the delivery end reaching right into the bunker port of the vessel. By an ingenious device the elevator can be dipped farther into the barge as the coal is unloaded, without altering the position of the delivery end. The receiving terminal revolves in the opposite direction to that usual in elevators; it is, therefore, termed under-fed. After a vertical run, beginning at the lower terminal, the chain forms a bight, negotiates the guide idler G, and assumes an essentially horizontal position towards the power-driven sprocket E. During this short run the coal leaves the buckets, dropping into a slightly hopped, bifurcated receptacle, from which it is led, by means of telescopic chutes, into the bunkers. The average capacity of one unit is 125 tons per hour, with an expenditure of 10 h.p.

B. The "Temperley" transporter is used either slung from the ship's tackle or from special coaling barges. It is self-contained and consists essentially of an I-shaped boom having a traveller running on the lower flange. The boom is triced up to the movable framework or shear legs and the traveller is worked by two ropes engaging with the two drums of a double-barreled winch. The boom is so arranged as to reach athwart the coaling barge and the vessel to be bunkered, in which coal can be dumped at any number of predetermined points.

The "Suisted" bunkering elevator (see fig. 4) consists essentially of a bucket elevator and band conveyor, mounted on two pontoons with room between for the coal barges; one of the pontoons contains the generating plant for power and light, while in the other is provided accommodation for the crew. It is so built that the upper structure straddles the barges to be unloaded, devouring their contents, and disgoring them into the bunkers of a vessel. The important feature is the way in which the bucket elevator is mounted between the two pontoons, so that it can be raised and lowered, as well as racked mechanically from side to side, in order to pick up the coal with the minimum amount of trimming. The 58ft. elevator is driven by a 60h.p. electric motor. Each bucket holds 4 cwt. of coal. The 48ft. band conveyor is 3ft. wide and runs at 400ft. per minute. The plant has a capacity of 300 tons per hour and requires nine men to work it. Since the racking of the elevator is limited by the hatch coamings, some trimming of the coal is necessary and this is performed by four of the nine men.

In some instances devices of this type have been built with a single large trimming pontoon to carry the coal and thus dispense with the barges, but since the economy of such expensive bunkering devices depends largely upon their being fully employed, it is short-sighted policy to use them for carriers also, unless they are of very large capacity. The best known of such devices are built in Holland by the firms of Schmulder, and Werft Conrad (see fig. 5); others are built by William Doxford & Sons, Ltd., Sunderland.

At Rotterdam, where the harbour is exceptionally spacious, the mechanical devices used are floating hoists on high steel structures which are fitted with grabs, but a great deal of dust is created during operation.

Harrisons (London) Ltd.'s bunkering pontoon (see fig. 6), is a device, unlike the "Suisted," mounted on one large pontoon, which, for the sake of stability, also carries the generating plant, including the motors and winches for the various movements. It consists of a 2-ton grab and bogie, which travel on a horizontal boom; a 30-ton bunker on board the pontoon, into which the grab discharges; a measuring device which doles out

the coal from the bunker alternatively into the twin vertical skip hoists with bottom door discharge; these raise the loads to a smaller receiving chamber which can be elevated sufficiently high for bunkering the biggest ships. Each of the two skip hoist units has a capacity of one ton, and they discharge alternatively into the receiving chamber, whence the coal is led, by means of a gravity chute, to any of the bunkering hatches, side or amid-ship. The measuring chamber and the skip hoists when in their lowest position are so enclosed as to exclude dust production; the coal-receiving chamber, high up in the structure, is also similarly enclosed.

When the bunkering device has been placed close up against the vessel to be coaled and a coal barge brought into position on the other side, the boom, on which the grab runs, is brought from its upright housed position to its horizontal working position; the grab is run out over the barge, lowered into the coal, and a charge lifted and deposited into the receiving bunker. The gravity chute is telescoped at the delivery end and can be slewed in either direction from the receiving chamber to the bunkers of a vessel. The upper terminal of the hoist is practically a compensating dumping frame which may be adjusted to any desired position by a separate motor and winding gear without stopping the working of the plant. In that position each skip is arrested for a few seconds, the bottom door automatically opened and the coal delivered into the receiving chamber. The door is then automatically closed as the skip returns to be refilled. The plant is worked by four men only. Perhaps the greatest advantage of this type of plant is the exclusion of dust during the bunkering process.

#### BUNKERING ON THE OPEN SEA

This was formerly much practised by the navies of different nations, but has now been almost entirely superseded by oil-fuel bunkering in port. The method is very complex, and it is not necessary to describe it in detail here: it is similar to that employed in rope and cableways. One terminal trestle is on the collier and the other on the ship to be bunkered. One vessel tows the other, keeping taut the connecting cable, which is well above the water; the coal in sacks is transferred along the cable by an endless hauling rope.

For oil-fuel bunkering at sea while under way, cable communication is similarly established between the vessels, but on a lower level. A hose-pipe is festooned on the cable so that the oil fuel can be pumped from one vessel direct to the bunkers of the other.

**Trimming the Bunkers.**—Since the capacity of these mechanical bunkering devices has frequently to be curtailed because the rate of trimming to the bunkers cannot keep pace with the rate of delivery, mechanical trimming devices are often employed. One method has already been alluded to in the description of the "De Mayo" plant, but a more efficient system, used particularly for loading coal on to big liners, is the "Lane-Galloway" trimming machine. This was originally installed at Curtis Bay (Md.), U.S.A., where large quantities of coal are loaded into vessels. The principle embodied is that of an endless band conveyor, sometimes fitted with cross cleats, on to which the coal is delivered. The speed of this band—2,700ft. per minute—is such as to impart to the coal when leaving the belt a velocity sufficient to throw it right across the bunker. The length of the belt is 3ft. to 4ft. from centre to centre and the width 48in. A machine on a similar principle is used in Scotland, the action of which is shown in fig. 7.

#### OIL FUEL BUNKERING

Owing to the many advantages of oil fuel, oil bunkering has become a most important factor. Compared with coal it takes but a tithe of the time to bunker; dust and smoke are avoided; trimming is no longer necessary; no ashes have to be disposed of; moreover, for equal fuel value, oil takes less bunkering space. The loss of heat which, in the case of coal, is occasioned by the cleaning of the fires, is avoided, since oil fuel can be supplied continuously and a constant pressure of steam maintained all the time.

FIG. 3.—"MICHENER" MACHINE  
This elevator, suspended from the side of the vessel, delivers coal directly into the bunkers. Buckets shown in thick lines are visible, while those in thin lines are enclosed. Letters A to K indicate the location of the idlers and sprockets determining the path of the chain of buckets

FIG. 4.—END VIEW OF THE "SUISTED" BUNKERING MACHINE. DESIGNED BY THE SUISTED ELEVATOR COMPANY. THIS DEVICE IS MADE UP OF A BUCKET ELEVATOR AND A BAND CONVEYOR, MOUNTED ON PONTOONS, BETWEEN WHICH THE COAL BARGES (NOT SHOWN) ARE ACCOMMODATED. THE ELEVATOR DELIVERS ON TO THE BAND CONVEYOR WHICH TAKES THE COAL TO THE PORT HOLES

Oil-fuel bunkering is an extremely simple process and may be performed either on the quay or, more frequently, from the waterside, from floating tanks or "hulks." There are three possible means of dealing with the problem: The oil may be pumped into the vessel; or, if the storage receptacles are overhead, it may be delivered by gravity; or air pressure can be applied to closed

tanks and the oil thus forced through pipe-lines to the bunkers of the vessel to be served. Owing to the inflammable nature of the oil it is preferable not to supply it from the quay of a general dock, but this is, none the less, frequently the practice. In some cases, the oil mains from the depôts are floating, but submerged under water, as in the method employed by the Anglo-Mexican

BY COURTESY OF MESSRS. WERF CONRAD, LIMITED

FIG. 5.—GENERAL DESIGN OF A MOTOR-DRIVEN BUNKERING BOAT, CARRYING 900 TONS OF COAL WHICH IT TRANSSHIPS AT THE RATE OF 200 TONS PER HOUR. IT IS FITTED WITH FORE AND AFT DRAUGHT INDICATORS WHICH DETERMINE THE QUANTITY OF COAL DISCHARGED

Oil Company. Conveyance through measuring pumps is the practice commonly in vogue, through mains ranging from 8 in. to 10 in. and even 12 in. diameter. Pumps of the Worthington-Simpson and Hall types, etc., have been used for this purpose, having capacities up to 250 tons per hour, employing a 10 in. pipe-line. As a rule the pumps are located at the depôt, but many of the

some gift for writing, and most of the libretti of these operas were translated by himself.

See his *The Stage Before and Behind the Curtain* (3 vols., 1840).

**BUNNER, HENRY CUYLER** (1855–1896), American writer, was born in Oswego, N.Y., Aug. 3, 1855, and died in Nutley, N.J., May 11, 1896. Educated in New York city, Bunner, after a brief experience as clerk in an importing house, turned to journalism, serving on the staff of the *Arcadian*, at twenty-two becoming assistant editor and later editor of *Puck*. Since the staff of the comic weekly was very small and the funds were limited, there

FIG 6.—"VULCAN" BUNKERING MACHINE AT VICTORIA AND ALBERT DOCKS, LONDON. IN THIS PLANT THE COAL IS UNLOADED FROM THE BARGES BY GRAB—SEE LEFT—AND TRANSFERRED TO THE VESSEL BY A SKIP HOIST THROUGH A TELESCOPIC SHOOT—SEE RIGHT

oil-bunkering steamers carry their own pumps for taking in fuel from floating depôts.

At the Immingham Dock, where the largest ships are bunkered and where the largest tankers can unload, the oil storage tanks, of a total capacity of 2,280,000 gal., have connecting pipe-lines running from the tank into the dock and also to the eastern and western jetties, which afford excellent advantages for bunkering from the main store. These pipe-lines are of 10 in. and 12 in. diameter and are equipped with a number of oil delivery connections.

Such vessels as the "Aquitania" take in the whole of their oil fuel—about 2,000 tons—from a tanker in six hours, through two pipe-lines; one such vessel has been bunkered in the Armstrong yard in four hours. (G. F. Z.)

**BUNN, ALFRED** (1796–1860), English theatrical manager, was stage-manager of Drury Lane theatre, London (1823), of the Theatre Royal, Birmingham (1826), and joint manager of Drury Lane and Covent Garden, London (1833). He had difficulties first with his company, then with the lord chamberlain, and had a long-standing quarrel with Macready, which resulted in the tragedian assaulting the manager. In 1840 Bunn was declared a bankrupt, but he continued to manage Drury Lane till 1848. Artistically his control of the two chief English theatres was highly successful. He made a courageous attempt to establish English opera, producing the principal works of Balfe. He had

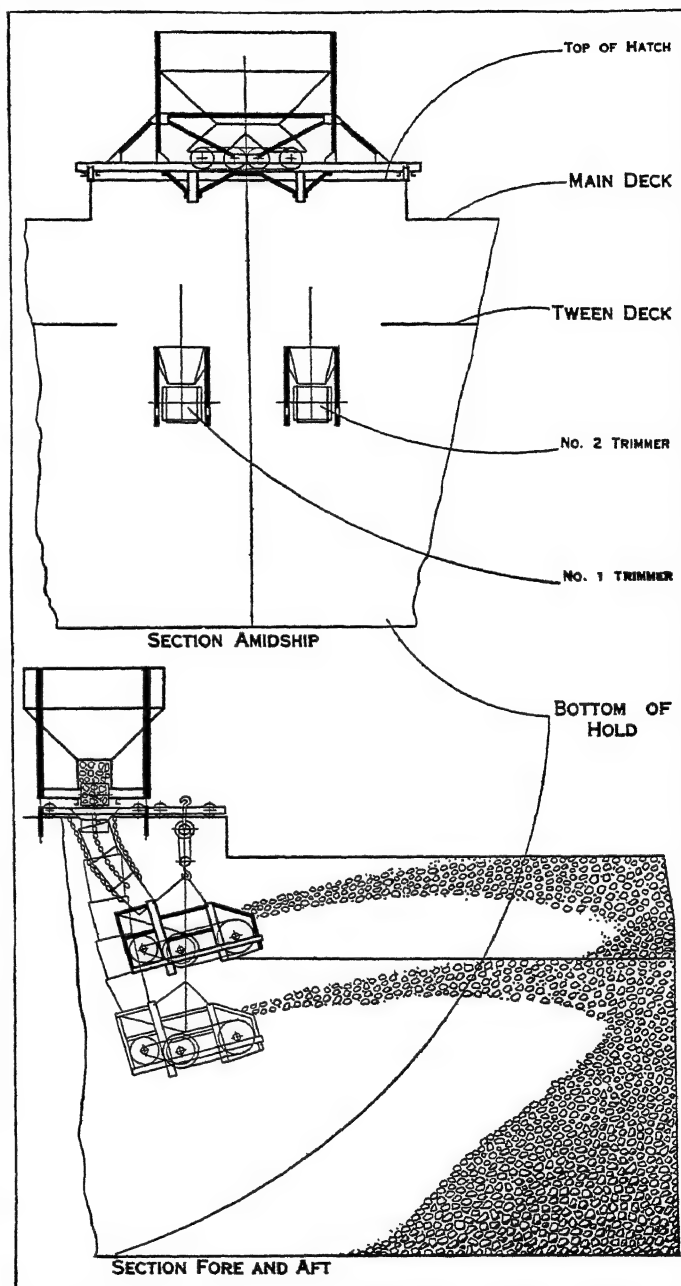

FIG. 7.—METHOD OF MECHANICAL TRIMMING IN WHICH THE COAL IS SPOUTED ON TO A FAST-RUNNING BAND CONVEYOR, WHICH THROWS IT TO THE REMOTEST ENDS OF THE BUNKERS

were many weeks when he wrote nearly half the issue. He refused, however, to republish this work, and is judged as a man of letters by his fiction and his charming *vers de société*. In both these lines French influence is dominant. Like his friend Brander Matthews and like Austin Dobson, he was inspired by the intricate and graceful verse forms of the 15th century. "*Made in France, French Tales Retold with a United States Twist* (1893), and to a

lesser extent his other stories reveal his indebtedness to Maupassant and other French masters. Technical dexterity, playfulness, and smoothness of finish mark his prose as well as his verse—*Airs from Arcady and Elsewhere* (1884), *Rowen* (1892), and *Poems* (1896).

Bunner published several novels, including *The Midge* (1886) and *The Story of a New York House* (1887), but these are surpassed by his stories and sketches, "*Short Sizes*" (1891), *More "Short Sixes"* (1894), *In Partnership* (with Brander Matthews, 1884), *Zadoc Pine* (1891), *Love in Old Cloathes* (1896), and *Jersey Street and Jersey Lane* (1896). A collected edition of his *Poems*, with an introductory note by Brander Matthews, appeared in 1896. The best of his *Stories* were re-published in 1916. An edition of his stories in 1917 included "*Short Sixes*" and *The Suburban Sage*, the latter originally published in 1896. Of several plays (chiefly written in collaboration) the best was *The Tower of Babel* (1883).

**BUNSEN, CHRISTIAN CHARLES JOSIAS, BARON VON** (1791–1860), Prussian diplomatist and scholar, was born on Aug. 25, 1791, at Korbach, Waldeck, and studied at Göttingen. In 1813 he travelled with W. B. Astor in Germany, and then turned to the study of the religion, laws, language and literature of the Teutonic races. He had read Hebrew when a boy, and now worked at Arabic, Persian and Norse. In 1815 he went to Berlin, to lay before Niebuhr the plan of research which he had mapped out. Niebuhr was so impressed with Bunsen's ability that, two years later, when he became Prussian envoy to the papal court, he made the young scholar his secretary. The intervening years Bunsen spent in assiduous labour among the libraries and collections of Paris and Florence. In July 1817 he married Frances Waddington, eldest daughter of B. Waddington of Llanover, Monmouthshire.

As secretary to Niebuhr, Bunsen was brought into contact with the Vatican movement for the establishment of the papal church in the Prussian dominions to provide for the largely increased Catholic population, and was among the first to realize the importance of this new vitality on the part of the Vatican. He pursued a conciliatory policy on the mixed marriages question, when he was put in charge of the legation on Niebuhr's resignation. But the brief (1830) in which the papal concessions were made was ambiguous. Count Spiegel, archbishop of Cologne, accepted a compromise at Berlin, but in 1835 he died, and was succeeded by the ultramontane Baron von Droste-Vischering, who adopted the extreme Catholic position and was removed from his diocese by the government. Bunsen, who was said to have recommended this coup, was then refused audience by the pope. The Prussian government, in this *impasse*, took the safest course, refused to support Bunsen, and accepted his resignation in April 1838.

After leaving Rome Bunsen spent two years as ambassador in Berne, and was transferred in 1842 to the London Embassy where he spent the rest of his official life. The accession to the throne of Prussia of Frederick William IV. (June 7, 1840) made a great change in Bunsen's career. Ever since their first meeting in 1828 the two men had exchanged ideas in an intimate correspondence. Enthusiasm for evangelical religion and admiration for the Anglican Church they held in common, and Bunsen was selected for realizing the king's fantastic scheme of setting up at Jerusalem a Prusso-Anglican bishopric as a sign of the unity and aggressive force of Protestantism. The bishopric was established, endowed with Prussian and English money, and was for some forty years an isolated symbol of Protestant unity and a rock of stumbling to Anglican Catholics. His tenure of the London embassy coincided with the critical period in Prussian and European affairs which culminated in the revolutions of 1848. Bunsen realized the significance of the signs that heralded the coming storm, and tried in vain to move the king to a policy which would have placed him at the head of a Germany united and free. He felt bitterly the humiliation of Prussia by Austria after the victory of the reaction, and in 1852 he set his signature reluctantly to the treaty which, in his view, surrendered the "constitutional rights of Schleswig and Holstein." On the outbreak of the Crimean War he urged Frederick William to throw in his lot with the western powers, and create a diversion in the north-east which would have forced Russia at once to terms. The rejection of his advice, and the proclamation of Prussia's attitude of "benevolent

neutrality," led him in April 1854 to offer his resignation, which was accepted.

Bunsen retired to Bonn and in 1855 published *Die Zeichen der Zeit: Briefe, etc.* (2 vols.), which exercised an immense influence in reviving the Liberal movement which the failure of the revolution had crushed. Frederick William made him a baron in 1857. In 1858, at the special request of the regent (afterwards the emperor) William, he took his seat in the Prussian Upper House. Bunsen died on Nov. 28, 1860.

His *Memoirs* in 1868, contain much of his private correspondence. The German translation (3 vols. 1868–71) of these *Memoirs*, published by his wife, has added extracts from unpublished documents. Baron Humboldt's letters to Bunsen were printed in 1869. His works include *The Church of the Future* (Eng. ed. 1847); *Aegyptens Stelle in der Weltgeschichte* (5 vols. 1845–57); *Ignatius von Antiochen* (1847); *God in History* (3 vols. Leipzig, 1857–58, Eng. trans. 1870). His grandson, Sir Maurice de Bunsen (b. 1852), entered the English diplomatic service in 1877, was minister at Lisbon (1905), ambassador at Madrid (1906), Vienna (1913) and special representative in the United States (1918–19).

See also L. von Ranke, *Aus dem Briefwechsel Friedrich Wilhelms IV. mit Bunsen* (1873); Bühring, *Christian K. J. von Bunsen* (1892); and Ulbricht, *Bunsen und die deutsche Einheitsbewegung* (1910).

**BUNSEN, ROBERT WILHELM VON** (1811–1890), German chemist, was born at Göttingen on March 31, 1811. He was professor of chemistry at Kassel, Marburg, Breslau, and from 1852 to a few months before his death on Aug. 16, 1890, at Heidelberg. His first important research work was concerned with the cacodyl compounds, though he had already, in 1834, discovered the virtues of freshly precipitated hydrated ferric oxide as an antidote to arsenical poisoning. It was begun in 1837 at Kassel, and during the six years he spent upon it he not only lost the sight of one eye through an explosion, but nearly killed himself by arsenical poisoning. It represents almost his only excursion into organic chemistry, and is of historical interest as being the forerunner of the fruitful investigations on the organo-metallic compounds subsequently carried out by his English pupil, Edward Frankland. Simultaneously with his work on cacodyl, he was studying the composition of the gases given off from blast furnaces. He showed that in German furnaces nearly half the heat yielded by the fuel was being allowed to escape with the waste gases, and when he came to England, and with Lyon Playfair investigated the conditions in English furnaces, he found the waste to amount to over 80%. These researches led to the elaboration of Bunsen's famous methods of measuring gaseous volumes, etc., which form the subject of the only book he ever published (*Gasometrische Methoden*, 1857). In 1841 he invented the carbon-zinc electric cell which is known by his name; he first employed it to produce the electric arc, and showed that from 44 cells a light equal to 1,171.3 candles could be obtained with the consumption of one pound of zinc per hour. To measure this light he designed in 1844 the grease-spot photometer. In 1852 he began to carry out electrolytical decompositions by the aid of the battery. He obtained magnesium for the first time in the metallic state, and studied its chemical and physical properties, among other things demonstrating the brilliance and high actinic qualities of the flame it gives when burnt in air. From 1855 to 1863 he published with Roscoe a series of investigations on photochemical measurements, which W. Ostwald has called the "classical example for all future researches in physical chemistry." He is generally credited with the invention of the Bunsen burner (*q.v.*). Other appliances invented by him were the ice-calorimeter (1870), the vapour calorimeter (1887), and the filter pump (1868). In 1846 he paid a visit to Iceland. There he investigated the phenomena of the geysers.

But the most far-reaching of his many achievements was the elaboration, about 1859, jointly with G. R. Kirchhoff, of spectrum analysis. It led Bunsen himself almost immediately to the isolation of two new elements of the alkali group, caesium and rubidium. Having noticed some unknown lines in the spectra of certain salts he was examining, he set to work to obtain the substance or substances to which these were due. To this end he evaporated large quantities of the Dürkheim mineral water; he

dealt with 40 tons of the water to get about 17 grammes of the mixed chlorides of the two substances, and with about one-third of that quantity of caesium chloride was able to prepare the most important compounds of the element and determine their characteristics, even making goniometrical measurements of their crystals. He instituted a regular course of practical work at Marburg so far back as 1840.

See Sir Henry Roscoe's "Bunsen Memorial Lecture," *Trans. Chem. Soc.*, 1900, which is reprinted (in German) with other obituary notices in an edition of Bunsen's collected works published by Ostwald and Bodenstein in 3 vols. at Leipzig in 1904.

**BUNSEN BURNER**, a burner so designed that it mixes a predetermined quantity of air with the stream of gas before it is ignited. If the proportions of gas and air are correct the resulting flame is hot and non-luminous. The invention of this widely used burner is ascribed to Robert Wilhelm von Bunsen (*q.v.*), though recent investigations prove that the credit for the actual design should go to Peter Desdga, if not to Michael Faraday (*q.v.*) who had previously designed an adjustable burner on this principle.

The simple idea, attributed to Bunsen, of admitting air into a tube along with gas to produce a hot non-luminous flame, is incorporated in the construction of millions of burners for heating and lighting purposes. The Bunsen flame results when air and gas are admitted in the proportion of about three volumes of air to one of gas; these produce the inner lower cone of the flame, evolving a mixture of water-vapour, carbon monoxide, hydrogen, carbon dioxide and nitrogen. The water-gas and nitrogen reach the outer combustion zone where the water-gas becomes burned up by the ordinary, or secondary, air supply. Various effects, as fusion, oxidation and reduction are obtainable with the flame and blowpipe. Certain metallic salts impart characteristic coloration to the colourless flame.

Varieties of laboratory Bunsens are chiefly distinguished by improvements in the control and mixing of the air and gas, giving greater heating powers and enabling different sizes of flames to be obtained. Among the most efficient of these are the Meeker and the Fisher burners. Numerous fittings are made to go on the top of the tube for spreading the flame, or taking special holding devices. Several designs avoid the fault of the ordinary central gas jet, which may become choked up by matter falling down the tube, the gas being brought in at the side and the air at the bottom, with a coned regulator raised and lowered by a knob. Marshall's burner has a flat regulator working beneath the base, as seen in the sectional view. Burners may be constructed to burn coal-gas, oil-gas, acetylene or natural gas.

The Bunsen burners fitted to incandescent lights, the so-called Welsbach burner (*q.v.*), require careful manufacture to ensure satisfactory results. The jet or injector must be exactly central with the Bunsen tube, and the interior surfaces finished smoothly and straight, with no raggedness at the orifice, otherwise the flame will not "fit" and heat the mantle properly. Passage through gauze or several fine holes assists in mixing, while a special mixing chamber is often included. A Venturi tube has the effect of increasing the velocity of the flow of gas, so enabling it to suck in more air. High-pressure gas lighting has given increased efficiency by reason of the increased velocity also secured. Air-blast for furnaces constitutes another way of increasing air supply and obtaining higher temperatures. The practice of preheating is another advance in aiding perfect combustion; instead of passing cold air into the Bunsen tube the lamp has a heating tube or chamber,

while in some the mixture is preheated. Furnaces are built with recuperative action to heat the air supply from the furnace itself. (F. H.)

**BUNTING, JABEZ** (1779-1858), English Wesleyan divine, was born in Manchester on May 13, 1779. He was educated at Manchester grammar school, and at the age of 19 began to preach, being received into full connection in 1803. In 1835 he was appointed president of the first Wesleyan theological college (at Hoxton). He was four times chosen to be president of the conference, was repeatedly secretary of the "Legal Hundred," and for 18 years was secretary to the Wesleyan Missionary Society. Bunting was a popular preacher, and an effective platform speaker. He died on June 16, 1858. His eldest son, William Maclardie Bunting (1805-1866), was also a distinguished Wesleyan minister; and his grandson Sir Percy William Bunting (1836-1911), son of T. P. Bunting and editor of the *Contemporary Review* from 1882, was knighted in 1908. He died on July 22, 1911.

See T. P. Bunting, *Life of Jabez Bunting* (1859-87), and G. S. Rowe, *Memorials of W. M. Bunting*, with biographical introduction by T. P. Bunting (1870).

**BUNTING**, the common English name of the bird *Emberiza miliaria*, a member of the family *Fringillidae* and distinguished by the angular gape, bony knob on the palate and hairlike streaks on the eggs. The corn bunting (*E. miliaria*) inhabits Europe and most of Asia, nesting on the ground and forming flocks in winter. The voice is harsh. The even commoner yellow-hammer (*E. citrinella*) is widely distributed and its monotonous song (often rendered as "A-little-bit-of-bread-and-no-cheese") is very familiar in Britain. The curl bunting (*E. cirrus*), with an olive-green head, is somewhat more southerly. The reed bunting (*E. schoeniclus*), recognized by its black head and white nape, is common in marshy places, to the exclusion of the other species. The snow bunting (*Plectrophenax nivalis*) breeds further north than any other passerine bird, reaching Spitzbergen. Of the American forms, the black-throated bunting or dickcissel (*Spiza americana*) inhabits the open country in central states, where it is migratory; the bay-winged bunting, vesper sparrow or grass finch (*Pooecetes gramineus*) of eastern Canada and U.S.A. is distinguished by its chestnut wings; the lark bunting (*Calamospiza melanocorys*) of the western states resembles a lark in habits and has a brilliant song. American buntings in general are brilliantly coloured. See also RICE-BIRD; ORTOLAN; PAINTED BUNTING; INDIGO-BIRD.

Bunting is a word of doubtful origin, possibly connected with *bunt*, to sift, or with the German *bunt*, of varied colour, also indicates a loosely woven woollen cloth for making flags, and is also used of a collection of flags, and particularly those of a ship.

**BUNYAN, JOHN** (1628-1688), English religious writer, was born at Elstow, about a mile from Bedford, in Nov. 1628. His father, Thomas Bunyan,<sup>1</sup> was a tinker, or, as he described himself, a "brasier." The tinkers then formed a hereditary caste, which was held in no high estimation. Bunyan's father had a fixed residence, and was able to send his son to a village school, where reading and writing were taught.

The years of John's boyhood were those during which the Puritan spirit was in the highest vigour all over England, and nowhere had that spirit more influence than in Bedfordshire. It is not wonderful, therefore, that a lad to whom nature had given a powerful imagination and sensibility which amounted to a disease, should have been early haunted by religious terrors. Before he was ten his sports were interrupted by fits of remorse and despair; and his sleep was disturbed by dreams of fiends trying to fly away with him. As he grew older his mental conflicts became still more violent. The strong language in which

<sup>1</sup>The name, in various forms as Buignon, Buniun, Bonyon or Bunyan, appears in the local records of Elstow and the neighbouring parishes at intervals from as far back as 1199. They were small freeholders, but all the property except the cottage had been lost in the time of Bunyan's grandfather. Bunyan's own account of his family as the "meanest and most despised of all the families of the land" must be put down to his habitual self-depreciation. Thomas Bunyan had a forge and workshop at Elstow.

DIAGRAM OF A BUNSEN BURNER  
Before the gas is ignited a correct proportion of air is mingled with it producing a hot and non-luminous flame

he described them strangely misled all his earlier biographers except Southey. It was long an ordinary practice with pious writers to cite Bunyan as an instance of the supernatural power of divine grace to rescue the human soul from the lowest depths of wickedness. He is called in one book the most notorious of profligates; in another, the brand plucked from the burning. Many excellent persons, whose moral characters from boyhood to old age have been free from any stain discernible to their fellow-creatures, have, in their autobiographies and diaries, applied to themselves, and doubtless with sincerity, epithets as severe as could be applied to Titus Oates or Mrs. Brownrigg.

It is quite certain that Bunyan was, at 18, what, in any but the most austere puritanical circles, would have been considered as a young man of singular gravity and innocence. Indeed, it may be remarked that he, like many other penitents who, in general terms, acknowledge themselves to have been the worst of mankind, fired up, and stood vigorously on his defence, whenever any particular charge was brought against him by others. He declares, it is true, that he had let loose the reins on the neck of his lusts, that he had delighted in all transgressions against the divine law, and that he had been the ringleader of the youth of Elstow in all manner of vice. But when those who wished him ill accused him of licentious amours, he called on God and the angels to attest his purity. No woman, he said, in heaven, earth, or hell could charge him with having ever made any improper advances to her. Not only had he been strictly faithful to his wife; but he had, even before his marriage, been perfectly spotless. It does not appear from his own confessions, or from the railings of his enemies, that he ever was drunk in his life. One bad habit he contracted, that of using profane language; but he tells us that a single reproof cured him so effectually that he never offended again. The worst that can be laid to his charge is that he had a great liking for some diversions, quite harmless in themselves, but condemned by the rigid precisians among whom he lived, and for whose opinion he had a great respect. The four chief sins of which he was guilty were dancing, ringing the bells of the parish church, playing at tipcat and reading the history of Sir Bevis of Southampton. A rector of the school of Laud would have held such a young man up to the whole parish as a model. But Bunyan's notion of good and evil had been learned in a very different school; and he was made miserable by the conflict between his taste and his scruples.

When he was about 17 the ordinary course of his life was interrupted by an event which gave a lasting colour to his thought. He enlisted in the Parliamentary army, and served during the decisive campaign of 1645.<sup>1</sup> All that we know of his military career is, that, at the siege of some town, one of his comrades, who had marched with the besieging army instead of him, was killed by a shot. Bunyan ever after considered himself as having been saved from death by the special interference of Providence. It may be observed that his imagination was strongly impressed by the glimpse which he had caught of the pomp of war. To the last he loved to draw his illustrations of sacred things from camps and fortresses, from guns, drums, trumpets, flags of truce, and regiments arrayed each under its own banner. His Greatheart, his Captain Boanerges and his Captain Credence are evidently portraits, of which the originals were among those martial saints who fought and expounded in Fairfax's army.

In 1646 Bunyan returned home and married about two years later. His wife had some pious relations, and brought him as her only portion some pious books. His mind, excitable by nature, very imperfectly disciplined by education, and exposed to the

enthusiasm which was then epidemic in England, began to be fearfully disordered. The story of the struggle is told in Bunyan's *Grace Abounding*.

In outward things he soon became a strict Pharisee. He was constant in attendance at prayers and sermons. His favourite amusements were, one after another, relinquished, though not without many painful struggles. In the middle of a game of tipcat he paused, and stood staring wildly upwards with his stick in his hand. He had heard a voice asking him whether he would leave his sins and go to heaven, or keep his sins and go to hell; and he had seen an awful countenance frowning on him from the sky. The odious vice of bell-ringing he renounced; but he still for a time ventured to go to the church tower and look on while others pulled the ropes. But soon the thought struck him that, if he persisted in such wickedness, the steeple would fall on his head; and he fled in terror from the accursed place. To give up dancing on the village green was still harder; and some months elapsed before he had the fortitude to part with his darling sin. When this last sacrifice had been made, he was, even when tried by the maxims of that austere time, faultless. All Elstow talked of him as an eminently pious youth. But his own mind was more unquiet than ever. Having nothing more to do in the way of visible reformation, yet finding in religion no pleasures to supply the place of the juvenile amusements which he had relinquished, he began to apprehend that he lay under some special malediction; and he was tormented by a succession of fantasies which seemed likely to drive him to suicide or to bedlam. At one time he took it into his head that all persons of Israelite blood would be saved, and tried to make out that he partook of that blood; but his hopes were speedily destroyed by his father, who seems to have had no ambition to be regarded as a Jew. At another time Bunyan was disturbed by a strange dilemma: "If I have not faith, I am lost; if I have faith, I can work miracles." He was tempted to cry to the puddles between Elstow and Bedford, "Be ye dry," and to stake his eternal hopes on the event. Then he took up a notion that the day of grace for Bedford and the neighbouring villages was past; that all who were to be saved in that part of England were already converted; and that he had begun to pray and strive some months too late. Then he was harassed by doubts whether the Turks were not in the right and the Christians in the wrong. Again, he was troubled by a maniacal impulse which prompted him to pray to the trees, to a broomstick, to the parish bull.

As yet, however, he was only entering the valley of the shadow of death. Soon the darkness grew thicker. Hideous forms floated before him. Sounds of cursing and wailing were in his ears. His way ran through stench and fire, close to the mouth of the bottomless pit. He began to be haunted by a strange curiosity about the unpardonable sin, and by a morbid longing to commit it. But the most frightful of all the forms which his disease took was a propensity to utter blasphemy, and especially to renounce his share in the benefits of the redemption. Night and day, in bed, at table, at work, evil spirits, as he imagined were repeating close to his ear the words, "Sell him, sell him. He struck at the hobgoblins; he pushed them from him; but still they were ever at his side. He cried out in answer to them hour after hour, "Never, never; not for thousands of worlds not for thousands." At length, worn out by this long agony, he suffered the fatal words to escape him, "Let him go if he will. Then his misery became more fearful than ever. He had done what could not be forgiven. He had forfeited his part of the great sacrifice. Like Esau, he had sold his birthright; and there was no longer any place for repentance. "None," he afterwards wrote, "knows the terrors of those days but myself." He had described his sufferings with singular energy, simplicity and pathos. He envied the brutes; he envied the very stones on the street, and the tiles on the houses. The sun seemed to withhold its light and warmth from him. His body, though cast in sturdy mould, and though still in the highest vigour of youth trembled whole days together with the fear of death and judgment. He fancied that this trembling was the sign set on the worst reprobates, the sign which God had put on Cain. T

<sup>1</sup>A pamphlet entitled "New Documentary Evidence of John Bunyan as a Soldier," reprinted from the *Bedfordshire Times* of Dec. 26 1924, shows that Bunyan joined the Newport Pagnell garrison on Nov. 30 1644. The town where one of his comrades, who had marched with the besieging army instead of him, was shot, was probably Leicester, to which a part of the Newport Pagnell garrison was sent in 1645. An order was issued in Aug. 1646 that the Newport garrison should be disbanded and the soldiers "employed for the service of Ireland." Perhaps Bunyan was one of these, for his name occurs in the troop of an Irish officer, Lieut.-col. Charles O'Hara, which was mustered at Newport on Jan. 17 1647. If so, the date of his return home would be 1647, not 1646. (Ed. E. B.)

unhappy man's emotion destroyed his power of digestion. He had such pains that he expected to burst asunder like Judas, whom he regarded as his prototype.

Neither the books which Bunyan read, nor the advisers whom he consulted, were likely to do much good in a case like his. His small library had received a most unseasonable addition, the account of the lamentable end of Francis Spira. One ancient man of high repute for piety, whom the sufferer consulted, gave an opinion which might well have produced fatal consequences. "I am afraid," said Bunyan, "that I have committed the sin against the Holy Ghost." "Indeed," said the old fanatic, "I am afraid that you have."

At length the clouds broke; the light became clearer and clearer; and the enthusiast who had imagined that he was branded with the mark of the first murderer, and destined to the end of the arch-traitor, enjoyed peace and a cheerful confidence in the mercy of God. Years elapsed, however, before his nerves, which had been so perilously overstrained, recovered their tone. When he had joined a Baptist society at Bedford, and was for the first time admitted to partake of the eucharist, it was with difficulty that he could refrain from imprecating destruction on his brethren while the cup was passing from hand to hand. After he had been some time a member of the congregation he began to preach; and his sermons produced a powerful effect. He was indeed illiterate; but he spoke to illiterate men. The severe training through which he had passed had given him such an experimental knowledge of all the modes of religious melancholy as he could never have gathered from books, and his vigorous genius, animated by a fervent spirit of devotion, enabled him not only to exercise a great influence over the vulgar, but even to extort the half-contemptuous admiration of scholars. Yet it was long before he ceased to be tormented by an impulse which urged him to utter words of horrible impiety in the pulpit.<sup>1</sup>

Bunyan was finally relieved from the internal sufferings which had embittered his life by sharp persecution from without. He had been five years a preacher when the Restoration put it in the power of the Cavalier gentlemen and clergymen all over the country to oppress the dissenters. In Nov. 1660 he was flung into Bedford gaol; and there he remained, with some intervals of partial and precarious liberty, during 12 years. The authorities tried to extort from him a promise that he would abstain from preaching; but he was convinced that he was divinely set apart and commissioned to be a teacher of righteousness, and he was fully determined to obey God rather than man. He was brought before several tribunals, laughed at, caressed, reviled, menaced, but in vain. He was facetiously told that he was quite right in thinking that he ought not to hide his gift; but that his real gift was skill in repairing old kettles. He was compared to Alexander the coppersmith. He was told that if he would give up preaching he should be instantly liberated. He was warned that if he persisted in disobeying the law he would be liable to banishment, and that if he were found in England after a certain time his neck would be stretched. His answer was, "If you let me out to-day, I will preach again to-morrow." Year after year he lay patiently in a dungeon, compared with which the worst prison now to be found in the island is a palace.<sup>2</sup> His fortitude is the more extraordinary because his domestic feelings were unusually strong. Indeed, he was considered by his stern brethren as somewhat too fond and indulgent a parent. He had four small children, and among them a daughter who was blind, and whom

he loved with peculiar tenderness. He could not, he said, bear even to let the wind blow on her; and now she must suffer cold and hunger; she must beg; she must be beaten; "yet," he added, "I must, I must do it."

His second wife, whom he had married just before his arrest, tried in vain for his release; she even petitioned the House of Lords on his behalf. While he lay in prison he could do nothing in the way of his old trade for the support of his family. He determined, therefore, to take up a new trade. He learned to make long-tagged thread laces; and many thousands of these articles were furnished by him to the hawkers. While his hands were thus busied he had other employments for his mind and his lips. He gave religious instruction to his fellow-captives, and formed from among them a little flock, of which he was himself the pastor. He studied indefatigably the few books which he possessed. His two chief companions were the Bible and Fox's *Book of Martyrs*. His knowledge of the Bible was such that he might have been called a living concordance; and on the margin of his copy of the *Book of Martyrs* are still legible the ill-spelt lines of doggerel in which he expressed his reverence for the brave sufferers, and his implacable enmity to the mystical Babylon.

Prison life gave him leisure to write, and during his first imprisonment he wrote, in addition to several tracts and some verse, *Grace Abounding to the Chief of Sinners*, the narrative of his own religious experience. The book was published in 1666. A short period of freedom was followed by a second offence and a further imprisonment. Bunyan's works were coarse, indeed, but they showed a keen mother wit, a great command of the homely mother tongue, an intimate knowledge of the English Bible, and a vast and dearly bought spiritual experience. They were well received, therefore, when the corrector of the press had improved the syntax and the spelling.

Much of Bunyan's time was spent in controversy. He wrote sharply against the Quakers, whom he seems always to have held in utter abhorrence. He wrote against the liturgy of the Church of England. No two things, according to him, had less affinity than the form of prayer and the spirit of prayer. Those, he said with much point, who have most of the spirit of prayer are all to be found in gaol; and those who have most zeal for the form of prayer are all to be found at the alehouse. The doctrinal Articles, on the other hand, he warmly praised and defended. The most acrimonious of all his works is his *Defence of Justification by Faith*, an answer to what Bunyan calls "the brutish and beastly latitudinarianism" of Edward Fowler, afterwards bishop of Gloucester, an excellent man, but not free from the taint of Pelagianism.

Bunyan had also a dispute with some of the chiefs of the sect to which he belonged. He doubtless held with perfect sincerity the distinguishing tenet of that sect, but he did not consider that tenet as one of high importance, and willingly joined in communion with pious Presbyterians and Independents. The sterner Baptists, therefore, loudly pronounced him a false brother. A controversy arose which long survived the original combatants. The cause which Bunyan had defended with rude logic and rhetoric against Kiffin and Danvers has since been pleaded by Robert Hall with an ingenuity and eloquence such as no polemical writer has ever surpassed.

During the years which immediately followed the Restoration, Bunyan's confinement seems to have been strict. But as the passions of 1660 cooled, as the hatred with which the Puritans had been regarded while their reign was recent gave place to pity, he was less and less harshly treated. The distress of his family, and his own patience, courage and piety, softened the hearts of his judges. Like his own Christian in the cage, he found protectors even among the crowd at Vanity Fair. The bishop of the diocese, Dr. Barlow, is said to have interceded for him. At length the prisoner was suffered to pass most of his time beyond the walls of the gaol, on condition, as it should seem, that he remained within the town of Bedford.

He owed his complete liberation to one of the worst acts of one of the worst governments that England has ever seen. In

<sup>1</sup>Bunyan had joined, in 1653, the nonconformist community which met under a certain Mr. Gifford at St. John's church, Bedford. This congregation was not Baptist, properly so called, as the question of baptism, with other doctrinal points, was left open. When Bunyan removed to Bedford in 1655, he became a deacon of this church, and two years later he was formally recognized as a preacher, his fame soon spreading through the neighbouring counties. His wife died soon after their removal to Bedford, and he also lost his friend and pastor, Mr. Gifford. His earliest work was directed against Quaker mysticism and appeared in 1656. It was entitled *Some Gospel Truths Opened*; it was followed in the same year by a second tract in the same sense, *A Vindication of Gospel Truths*.

<sup>2</sup>He was not, however, as has often been stated, confined in the old gaol which stood on the bridge over the Ouse, but in the county gaol.

1671 the Cabal was in power. Charles II. had concluded the treaty by which he bound himself to set up the Roman Catholic religion in England. The first step which he took towards that end was to annul, by an unconstitutional exercise of his prerogative, all the penal statutes against the Roman Catholics; and in order to disguise his real design, he annulled at the same time the penal statutes against Protestant nonconformists. Bunyan was consequently set at large.<sup>1</sup> In the first warmth of his gratitude he published a tract, in which he compared Charles to that humane and generous Persian king, who, though not himself blest with the light of the true religion, favoured the chosen people, and permitted them, after years of captivity, to rebuild their beloved temple.

Before he left his prison, he had begun the book which has made his name immortal.<sup>2</sup> The history of that book is remarkable. The author was, as he tells us, writing a treatise, in which he had occasion to speak of the stages of the Christian progress. He compared that progress, as many others had compared it, to a pilgrimage. Soon his quick wit discovered innumerable points of similarity which had escaped his predecessors. Images came crowding on his mind faster than he could put them into words, quagmires and pits, steep hills, dark and horrible glens, soft vales, sunny pastures, a gloomy castle, of which the courtyard was strewn with the skulls and bones of murdered prisoners, a town all bustle and splendour, like London on the Lord Mayor's day, and the narrow path, straight as a rule could make it, running on up hill and down hill, through city and through wilderness, to the Black River and the Shining Gate. He had found out, as most people would have said, by accident, as he would doubtless have said, by the guidance of Providence, where his powers lay. He had no suspicion, indeed, that he was producing a masterpiece. He could not guess what place his allegory would occupy in English literature; for of English literature he knew nothing. Those who suppose him to have studied the *Faerie Queene* might easily be confuted, if this were the proper place for a detailed examination of the passages in which the two allegories have been thought to resemble each other. The only work of fiction, in all probability, with which he could compare his Pilgrim was his old favourite, the legend of Sir Bevis of Southampton. He would have thought it a sin to borrow any time from the serious business of his life, from his expositions, his controversies, and his lace tags, for the purpose of amusing himself with what he considered merely a trifle. It was only, he assures us, at spare moments that he returned to the House Beautiful, the Delectable Mountains and the Enchanted Ground. He had no assistance. Nobody but himself saw a line till the whole was complete.

He then consulted his pious friends. Some were pleased. Others were much scandalized. It was a vain story, a mere romance, about giants, and lions, and goblins, and warriors, sometimes fighting with monsters, and sometimes regaled by fair ladies in stately palaces. The loose atheistical wits at Will's might write such stuff to divert the painted Jezebels of the court; but did it become a minister of the gospel to copy the evil fashions of the world? There had been a time when the cant of such fools would have made Bunyan miserable. But that time was past; and his mind was now in a firm and healthy state. He saw that in employing fiction to make truth clear and goodness attractive, he was only following the example which every Christian ought to propose to himself; and he determined to print.

The *Pilgrim's Progress* was published in Feb. 1678. Soon the irresistible charm of a book which gratified the imagination of the reader with all the action and scenery of a fairy tale, which exercised his ingenuity by setting him to discover a multitude of curious analogies, which interested his feelings for human beings, frail like himself, and struggling with temptations from within and from without, which every moment drew a smile from him

<sup>1</sup>His formal pardon is dated Sept. 13 1672; but five months earlier he had received a royal licence to preach, and acted for the next three years as pastor of the non-conformist body to which he belonged, in a barn on the site of which stands the present Bunyan Meeting.

<sup>2</sup>It is now generally supposed that Bunyan wrote his *Pilgrim's Progress*, not during his 12 years' imprisonment, but during a short period of incarceration in 1675, probably in the old gaol on the bridge.

by some stroke of quaint yet simple pleasantry, and nevertheless left on his mind a sentiment of reverence for God and of sympathy for man, began to produce its effect. In puritanical circles, from which plays and novels were strictly excluded, that effect was such as no work of genius, though it were superior to the *Iliad*, to *Don Quixote* or to *Othello*, can ever produce on a mind accustomed to indulge in literary luxury. A second edition came out in the autumn with additions; and the demand became immense. The eighth edition, which contains the last improvements made by the author, was published in 1682, the ninth in 1684, the tenth in 1685. The help of the engraver had early been called in; and tens of thousands of children looked with terror and delight on execrable copperplates, which represented Christian thrusting his sword into Apollyon, or writhing in the grasp of Giant Despair. In Scotland, and in some of the colonies, the Pilgrim was even more popular than in his native country. Bunyan has told us, with very pardonable vanity, that in New England his dream was the daily subject of the conversation of thousands, and was thought worthy to appear in the most superb binding. He had numerous admirers in Holland and amongst the Huguenots of France.

He continued to work the gold-field which he had discovered, and to draw from it new treasures, not indeed with quite such ease and in quite such abundance as when the precious soil was still virgin, but yet with success, which left all competition far behind. In 1680 appeared the *Life and Death of Mr. Badman*; in 1684 the second part of the *Pilgrim's Progress*. In 1682 appeared the *Holy War*, relating the attempt of the powers of evil to gain the city of Man's soul, and which if the *Pilgrim's Progress* did not exist, would be the best allegory ever written.

Bunyan's place in society was now very different from what it had been. There had been a time when many dissenting ministers, who could talk Latin and read Greek, had affected to treat him with scorn. But his fame and influence now far exceeded theirs. He had so great an authority among the Baptists that he was popularly called Bishop Bunyan. His episcopal visitations were annual. From Bedford he rode every year to London, and preached there to large and attentive congregations. From London he went his circuit through the country, animating the zeal of his brethren, collecting and distributing alms and making up quarrels. The magistrates seem in general to have given little trouble. But there is reason to believe that, in the year 1685, he was in some danger of again occupying his old quarters in Bedford gaol.

In that year the rash and wicked enterprise of Monmouth gave the government a pretext for prosecuting the nonconformists; and scarcely one eminent divine of the Presbyterian, Independent or Baptist persuasion remained unmolested. Baxter was in prison; Howe was driven into exile; Henry was arrested. Two eminent Baptists, with whom Bunyan had been engaged in controversy, were in great peril and distress. Danvers was in danger of being hanged; and Kiffin's grandsons were actually hanged. The tradition is that, during those evil days, Bunyan was forced to disguise himself as a wagoner, and that he preached to his congregation at Bedford in a smock-frock, with a cart-whip in his hand. But soon a great change took place. James II. was at open war with the church and found it necessary to court the dissenters. Some of the creatures of the Government tried to secure the aid of Bunyan. They probably knew that he had written in praise of the Indulgence of 1672, and therefore hoped that he might be equally pleased with the Indulgence of 1687. But 15 years of thought, observation, and commerce with the world had made him wiser. Nor were the cases exactly parallel. Charles was a professed Protestant; James was a professed Papist. The object of Charles's indulgence was disguised; the object of James's indulgence was patent. Bunyan was not deceived. He exhorted his hearers to prepare themselves by fasting and prayer for the danger which menaced their civil and religious liberties, and refused even to speak to the courtier who came down to remodel the corporation of Bedford, and who, as was supposed, had it in charge to offer some municipal dignity to the bishop of the Baptists.

Bunyan did not live to see the Revolution.<sup>1</sup> In the summer of 1688 he undertook to plead the cause of a son with an angry father, and at length prevailed on the old man not to disinherit the young one. This good work cost the benevolent intercessor his life. He had to ride through heavy rain. He came drenched to his lodging on Snow Hill, was seized with a violent fever, and died in a few days (Aug. 31). He was buried in Bunhill Fields; and many Puritans, to whom the respect paid by Roman Catholics to the reliques and tombs of saints seemed childish or sinful, are said to have begged with their dying breath that their coffins might be placed as near as possible to the coffin of the author of the *Pilgrim's Progress*.

The fame of Bunyan during his life, and during the century which followed his death, was indeed great, but was almost entirely confined to religious families of the middle and lower classes. Very seldom was he during that time mentioned with respect by any writer of great literary eminence. Young coupled his prose with the poetry of the wretched D'Urfey. In the *Spiritual Quixote*, the adventures of Christian are ranked with those of Jack the Giant-Killer and John Hickathrift. Cowper ventured to praise the great allegorist, but did not venture to name him. It is a significant circumstance that, for a long time all the numerous editions of the *Pilgrim's Progress* were evidently meant for the cottage and the servants' hall. The paper, the printing, the plates, were all of the meanest description. In general, when the educated minority and the common people differ about the merit of a book, the opinion of the educated minority finally prevails. The *Pilgrim's Progress* is perhaps the only book about which the educated minority has come over to the opinion of the common people.

The attempts which have been made to improve and to imitate this book are not to be numbered. It has been done into verse; it has been done into modern English. The *Pilgrimage of Tender Conscience*, the *Pilgrimage of Good Intent*, the *Pilgrimage of Seek Truth*, the *Pilgrimage of Theophilus*, the *Infant Pilgrim*, the *Hindoo Pilgrim*, are among the many feeble copies of the great original. But the peculiar glory of Bunyan is that those who most hated his doctrines have tried to borrow the help of his genius. A Roman Catholic version of his parable may be seen with the head of the virgin in the title-page. On the other hand, those Antinomians for whom his Calvinism is not strong enough, may study the *Pilgrimage of Hephzibah*, in which nothing will be found which can be construed into an admission of free agency and universal redemption. But the most extraordinary of all the acts of vandalism by which a fine work of art was ever defaced was committed in the year 1853. It was determined to transform the *Pilgrim's Progress* into a Tractarian book. The task was not easy; for it was necessary to make two sacraments the most prominent objects in the allegory, and of all Christian theologians, avowed Quakers excepted, Bunyan was the one in whose system the sacraments held the least prominent place. However, the Wicket Gate became a type of baptism, and the House Beautiful of the eucharist. The effect of this change is such as assuredly the ingenious person who made it never contemplated. For, as not a single pilgrim passes through the Wicket Gate in infancy, and as Faithful hurries past the House Beautiful without stopping, the lesson which the fable in its altered shape teaches, is that none but adults ought to be baptized, and that the eucharist may safely be neglected. Nobody would have discovered from the original *Pilgrim's Progress* that the author was not a Paedobaptist. To turn his book into a book against Paedobaptism, was an achievement reserved for an Anglo-Catholic divine. Such blunders must necessarily be committed by every man who mutilates parts of a great work, without taking a comprehensive view of the whole. (M.)

The above article has been slightly corrected as to facts, as compared with its form in the 9th edition. Bunyan's works were first partially collected in a folio volume (1692) by his friend Charles Doe.

<sup>1</sup>He had resumed his pastorate in Bedford after his imprisonment of 1675, and, although he frequently preached in London to crowded congregations, and is said in the last year of his life to have been, of course unofficially, chaplain to Sir John Shorter, lord mayor of London, he remained faithful to his own congregation.

A larger edition (1736-37) was edited by Samuel Wilson of the Barbican. In 1853 a good edition was produced by George Offer. Southey's edition (1830) of the *Pilgrim's Progress* contained his *Life* of Bunyan. Since then various editions of the *Pilgrim's Progress*, many illustrated (by Cruikshank, Byam Shaw, W. Strang and others), have appeared. An interesting life by "the author of *Mark Rutherford*" (W. Hale White) was published in 1904. Other lives are by J. A. Froude (1880) in the "English Men of Letters" series, and E. Venables (1888); but the standard work on the subject is *John Bunyan; his Life, Times and Work* (1885), by the Rev. J. Brown of Bedford. A bronze statue, by Boehm, was presented to the town by the duke of Bedford in 1874. See also R. H. Coats, *John Bunyan* (1927); and G. O. Griffith, *John Bunyan* (1927).

**BUNYAN, PAUL**, a mythical hero of the lumber camps of the American north-west. According to James Stevens, the author of one version of the legends (*Paul Bunyan*, 1925) the stories which have been told in American timber lands for generations are of Canadian origin, but "it was the American loggers below the Border who made of Paul Bunyan a true hero of camp nights' entertainment. They gave him Babe, the blue ox, who measured forty-two ox handles and a plug of chewing tobacco between the horns. They created the . . . mythical logging camp, with the cookhouse of mountainous size and . . . they peopled this camp with astounding minor heroes. They made their Paul Bunyan an inventor and an orator and an industrialist whose labours surpassed those of Hercules. They devised a chronology for him; he ruled American life in the period between the Winter of the Blue Snow and the Spring that the Rain Came Up From China." In any case, the legend which is said to have begun in the Papineau Rebellion in Canada in 1837, when a "mighty-muscled, bellicose, bearded giant named Paul Bunyan . . . raged among the Queen's troops like Samson among the Philistines," had, by 1860, spread throughout the north-west, and perhaps even into the south where under the name of John Henry he became "the man worth talking about" in the work camp gang. According to Esther Shephard in her *Paul Bunyan* (1924) "some evidence points to a French-Canadian origin among the loggers of Quebec or northern Ontario, who may even have brought them from the old country. But other evidences point just as strongly to an American beginning, possibly in Michigan or Wisconsin." In the Minnesota camps, . . . the guards were "undoubtedly enriched by Scandinavian myth, and there Paul became a sort of modern Thor." At other places he became coloured by Indian legend. But whatever his habitat, he is best known and enjoyed in the stories of *Babe, the Blue Ox*; *The Winter of the Blue Snow*; *Digging Puget Sound* and *Paul's Hunting*, which are found in the books mentioned above.

**BUNZLAU**, a town of Germany, in Prussian Silesia, on the right bank of the Bober, a tributary of the Oder, 27m. W. of Liegnitz. Pop. (1925) 17,997. Bunzlau (Boleslav) received its name in the 12th century from Duke Boleslav, who separated it from the duchy of Glogau. Its importance was increased by numerous privileges and the possession of extensive mining works. It was frequently captured and recaptured in the wars of the 17th century, and in 1739 was completely destroyed by fire. The Bunzlau pottery is famous; woollen and linen cloth are manufactured, and there are quarries in the vicinity.

**BUONAFEDE, APPIANO** (1716-1793), Italian philosopher, was born at Comachio, in Ferrara, and died in Rome. He became professor of theology at Naples in 1740, and entering the religious body of the Celestines, rose to be general of the order. His *Della Restaurazione di ogni Filosofia ne' Secoli*, xvi., xvii., xviii., 1789 (German trans. by C. Heydenreich) gives a valuable account of 16th century Italian philosophy.

**BUOY**, a floating body employed to mark the navigable limits of channels, their fairways, sunken dangers or isolated rocks, mined or torpedo grounds, telegraph cables, or the position of a ship's moorings when they have been slipped; buoys also serve for a vessel to make fast to instead of anchoring. They vary in size and construction from a log of wood to steel mooring buoys for warships or a steel gas buoy. The origin of the word may be traced through O.Fr. boie, or Dutch boei, and English 15th Century "boye" from Lat. boia, fetter: it is now usually pronounced as "boy," and it has been spelt in that form; but Hakluyt's Voy-

ages spells it "bwoy," and this seems to indicate a different pronunciation which is also given in some modern dictionaries. The date when the first navigation buoy was laid off the coasts of the British Isles cannot be traced, but the regular marking by buoys of such places as the Thames estuary and the river Tees is known to have been in existence nearly 300 years ago. (See LIGHTHOUSES.)

**Uniform Systems of Marking Buoys.**—In 1882 a conference was held at Trinity House with H.R.H. the Duke of Edinburgh,

SELECTED TYPES OF BUOYS APPROVED BY THE U.S. BUREAU OF LIGHT-HOUSES

Each is characteristically coloured and numbered so as to give to mariners the most definite information possible concerning position of rocks, shoals, channels and abrupt turning points in channels

as president to investigate a proposal for the establishment of a uniform system of buoyage. The conference consisted of representatives from various bodies interested, and the questions of colour, visibility, shape and size of buoys were considered and a system of buoyage evolved which subsequently was adopted as the uniform system of buoyage for the United Kingdom and extended to India and the Dominions.

In 1889 an International Marine Conference was held at Washington, U.S.A., including representatives from most of the principal maritime nations of the world, as well as from countries as remote as China, Siam and Uruguay; it recommended the adoption of an international "lateral" system based primarily on colour, *i.e.*, starboard-hand buoys were to be red and port-hand buoys black or parti-coloured, while the use of spherical-shaped buoys to mark middle-grounds was definitely excluded. So far as the United Kingdom was concerned, the reasons advanced were not sufficiently strong to induce the authorities to depart from the uniform system arranged for Great Britain at the 1882 Conference.

Another Maritime Conference was held in St. Petersburg in March 1912, but Great Britain was not represented, and although the Conference proposed the reversal of the buoyage colouring recommended by the Washington Conference, only South Russia, Spain and Italy adopted its suggestions.

The coasts of some countries, in particular those in the Baltic, are not well suited to a "lateral" system of buoyage and a system known as the "compass" or "cardinal" system has been adopted, under which a combination of the shape, colour and topmark of the buoy indicates the compass bearing of the danger from the buoy. The countries using the cardinal system are Norway, Sweden, North Russia, Germany, Italy and Turkey (the last three use a "lateral" system as well).

As regards systems of buoyage in general, the British view is that buoys, not being essentially reliable seamarks, are only additional aids to the mariner, and so long as they conform in shape to some more or less simple general system and can easily be identified from the chart, uniformity in colouring is a secondary consideration, particularly as variations in colouring to distinguish different channels in the same estuary are a help to the mariner. As regards the colours of lights on lighted buoys, the system in the United States is to have red on starboard-hand buoys in consonance with the colour of the buoy and white or green lights on port-hand buoys. Under the system followed in the British Isles red is adopted usually for lights on port-hand buoys and white for starboard-hand buoys in narrow waters, but for positions in the open sea a red light has the obvious disadvantage inherent in reduced intensity and is only adopted when some specially distinctive character other than white is essential and then generally is confined to port-hand buoys; in any case, buoys with green lights are used exclusively for marking wrecks.

**Buoyage System in the British Isles.**—The uniform system of buoyage (which is of the type known as "lateral") adopted in the United Kingdom after the Conference in 1882 continued without modification until 1922 when a further conference was held at Trinity House to review the section of the uniform system relating to the "buoying and marking of wrecks"; this conference prepared a scheme for wreck-marking which has been adopted as the uniform system throughout the British Isles, while at the same time it made a few other modifications in the uniform system of buoyage, the principal one being a definition of the direction of the main stream of flood tide for the various districts around the coast, which put briefly is, in the case of the North Sea and English Channel towards the Thames and on the West Coast in a northerly direction.

The uniform system of buoyage for the British Isles, including the system of buoying and marking of wrecks adopted in 1922, is now as follows:—

- (1) The mariner when approaching the coast must determine his position on the chart, and note the direction of the main stream of flood tide.
- (2) The term "starboard-hand" shall denote that side which would be on the right hand of the mariner either going with the main stream of the flood, or approaching a harbour, river or estuary from seaward; the term "port-hand" shall denote the left hand of the mariner in the same circumstances.
- (3) Buoys showing the pointed top of a cone above water shall be called *Conical* (fig. 1) and shall always be starboard-hand buoys, as above defined.
- (4) Buoys showing a flat top above water shall be called *Can* (fig. 2) and shall always be port-hand buoys, as above defined.
- (5) Buoys showing a domed top above water shall be called *Spherical* (fig. 3) and shall mark the ends of middle grounds, *i.e.*, shoals in the middle of a channel.
- (6) Buoys having a tall central structure on a broad base shall be called *Pillar* buoys (fig. 4), and like all other special buoys, such as bell buoys, gas buoys, and automatic sounding buoys, shall be placed to mark special positions either on the coast or in the approaches to harbours.
- (7) Buoys showing only a mast above water shall be called *Spar* buoys. (Useful where floating ice is encountered or the current velocities are high.)
- (8) Starboard-hand buoys shall always be painted in one colour only. (In Scotland, red is invariably used.)
- (9) Port-hand buoys shall be painted of another characteristic colour, either single or parti-colour. (In Scotland, black is invariably used.)
- (10) *Spherical* buoys at the ends of middle grounds shall always be distinguished by horizontal stripes of white colour.
- (11) Surmounting beacons (on buoys) such as "staff and globe" and others, shall always be painted of one dark colour.
- (12) Staff and globe shall only be used on starboard-hand

buoys, staff and cage on port-hand; diamonds at the outer ends of middle grounds; and triangles at the inner ends. (St. George and St. Andrew crosses are principally employed to surmount shore beacons.) (13) Buoys on the same side of a channel, estuary or tideway may be distinguished from each other by names, numbers or letters, and where necessary by a staff surmounted with the appropriate beacon. (14) Buoys intended for moorings may be of any colour (other than green) and shape according to the discretion of the authority within whose jurisdiction they are laid, but for marking submarine telegraph cables the colour shall be black with the word "Telegraph" painted thereon in white letters. Spherical and Pillar buoys are not used by the United States and its possessions.

**Buoys and Marking of Wrecks.**—The system adopted for the buoys and marking of wrecks in British waters is briefly as follows:—

(1) Green shall be the colour for all purposes connected with wreck marking and should not be used for other floating seamarks. (2) Wreck-marking craft and buoys shall have the word "Wreck" in white letters on a green ground on them. (3) A buoy used for wreck marking shall be of one of the following shapes and if lighted exhibit one of the following characters in order to indicate to the mariner on which hand he should pass the buoy:—(a) On the Port-hand: Can shape exhibiting a green light giving two flashes. (b) On the Starboard-hand: Conical shape exhibiting a green light giving three flashes. (c) On either hand: Spherical shape exhibiting a green light giving one flash.

(4) A vessel used for wreck marking shall carry lights and shapes and give sound signals as follows to indicate to the mariner on which hand he should pass the vessel:—(a) On the Port-hand: two green lights in a vertical line not less than 6 feet apart from the end of a cross-yard, the lower light not less than 15 feet above the hull. By day green balls or shapes corresponding in number and arrangement to the green lights. During thick weather a deep-toned bell rung twice in succession every thirty seconds. (b) On the Starboard-hand: three green lights not less than 6 feet apart from the end of a cross-yard, the lowest not less than 9 feet above the hull. By day green balls or shapes corresponding in number and arrangement to the lights. In thick weather a deep-toned bell rung three times in succession every thirty seconds. (c) On either hand: four green lights, two in a vertical line not less than 6 feet apart on each end of a cross-yard, the horizontal distance between the lights to be not less than 15 feet nor more than 25 feet, and the height of the lower lights to be not less than 15 feet above the hull. By day green balls or shapes corresponding in number and arrangement to the lights. During thick weather a deep-toned bell rung four times in succession every thirty seconds.

(5) In narrow waters discretion is left to the authority having jurisdiction either to follow the above general rules or to modify them where necessary to meet local conditions.

**Buoy Moorings and Buoys for Special Purposes.**—Buoys are moored with specially tested cables secured, as a rule, to blocks of cast iron or concrete known as sinkers, the length of chain and weight of mooring depending on the depth of water and the strength of tide: in narrow waters

BY COURTESY OF THE U.S. LIGHTHOUSE SERVICE

the length of chain is also governed by the scope of the limits within which the buoy can be allowed to swing. Buoys are ordinarily constructed of steel. Buoys provided with oil-gas lights were first used about 1878; automatic apparatus for giving an occulting or flashing characteristic to the light was introduced in 1883. Further improvements in the lighting of buoys have followed the introduction early in the present century of dissolved acetylene gas. (See LIGHTHOUSE.)

Buoys, both lighted and unlighted, fitted with automatic whistles on the Courtenay principle (fig. 5) are sometimes used in posi-

tions where it is desirable to provide a sound-signal as well as a marking buoy, and where the depth of water is sufficient for the special type of buoy employed. The lower end of the air cylinder in the Courtenay buoy is open to the water which, rising relatively to the cylinder as the buoy descends in the trough of a wave, compresses the imprisoned air which is forced through the whistle at the top of the buoy. As the buoy rises on the crest of a wave,

FIG. 1.—CONICAL BUOY, SHOWING CONE ABOVE WATER, PLACED ALWAYS ON STARBOARD SIDE OF CHANNEL. FIG. 2.—CAN BUOY, SHOWING FLAT TOP, USED AS PORT-HAND BUOY. FIG. 3.—SPHERICAL BUOY, SHOWING DOME, USED TO MARK ENDS OF MIDDLE GROUNDS. FIG. 4.—PILLAR GAS BUOY, USED TO MARK SPECIAL POSITIONS. FIG. 5.—COURTENAY WHISTLING BUOY. FIG. 6.—BELL-BUOY USED TO MARK SPECIAL POSITIONS ON COASTS OR NEAR HARBOURS. THE TOPMARKS IN FIGS. 1, 2, 3, AND 6, ARE USED TO DISTINGUISH BUOYS OF THE SAME CHARACTER FROM EACH OTHER

air is drawn into the cylinder through two tubes fitted with non-return valves at the upper part of the buoy. Bells whose clappers are moved by the motion of the buoy (fig. 6) are also used as fog signals in connection with marking buoys. Sound signalling apparatus which depends for its functioning on the movement of a buoy cannot be relied on in calm weather, and as this so often coincides with fog conditions it militates against the efficiency of such apparatus as fog-signals.

Boat-shaped buoys carrying a light and also a bell are sometimes used in positions where there are strong currents, as in the Humber and Mersey. They have also been employed in similar conditions in other countries. A Nun buoy is one whose form is that of two cones joined together at the base and is ordinarily used for marking positions when surveying work is in progress and also for buoying temporarily the positions of sunken objects such as anchors, slipped moorings, etc. Small buoys lighted with dissolved acetylene gas are used by cable ships for marking temporary positions during cable laying operations.

**Moorings Buoys.**—Buoys secured to permanent moorings are placed in many harbours and anchorages for enabling ships entering a port to moor at specified positions instead of having to drop

anchor when they do not make fast alongside a quay wall or wharf, and also for enabling them to slip their moorings readily when required. A typical mooring buoy is of steel construction, pear-shaped with a central vertical tube through which passes a spindle fitted with a mooring shackle at either end. The upper shackle is provided for receiving the ship's hawser or cable. To the lower shackle is connected the main buoy chain which itself is joined by bridles and ground chains to two or more cast iron mooring screws, 4ft. in diameter, which are screwed into the river bed. The buoy chains are 3½ in. stud-link cable and the ground chains 4 in. long-link chain. On the Thames where there are more than 300 sets of moorings in existence buoys of a drum shaped pattern with a trunk tube are used. As many as five legs of ground chain with screws at each end are sometimes provided for moorings for heavy ships; the Cunard mooring in the Mersey probably exceeded in strength any others previously laid in order to combat the swift tide in which vessels of the "Aquitania" Class had to ride and swing; these moorings consisted of four legs of 120 fathoms of 3½ in. square link chain and one leg of 100 fathoms of 3½ in. stud link cable; the moorings were secured to a centre piece to which a large conical shaped buoy was attached.

On the Thames and the Tyne and in other narrow anchorages in rivers and in harbours of restricted area ships are moored fore and aft to two buoys. Where, however, there is ample scope for swinging a single mooring buoy suffices. Mooring buoys are also commonly made in the form of shallow drums. Those used by the Royal Navy are of steel. Heavy mooring anchors of various forms are also used for permanent buoy moorings, and occasionally large concrete blocks sunk in holes dredged in the harbour bed are employed in the place of anchors or screws. (J. M. N.)

See E. C. Shankland, *Modern Harbours* and publications of the International Hydrographic Bureau Monaco.

**BUPALUS** and **ATHENIS**, sons of Archermus, and members of the school of sculpture in marble which flourished in Chios in the 6th century B.C. They were contemporaries of the poet Hipponax (about 540 B.C.). Their works consisted almost entirely of draped female figures, Artemis, Fortune, the Graces. Augustus brought many of their works to Rome and placed them on the gable of the temple of Apollo Palatinus.

**BUPHONIA**, in Greek antiquities, a sacrificial ceremony, forming part of the *Diipolia* or *Diipoleia*, a religious festival held on the 14th of the month Skirophorion (June-July) at Athens, when a labouring ox was sacrificed to Zeus Polieus as protector of the city. A number of oxen were driven to his altar on the Acropolis, on which grain was spread; and when one of the oxen began to eat, the priest slew it with an ax, which he immediately threw away and fled. The ax, being polluted by murder, was now carried before the court of the Prytaneum (which tried inanimate objects for homicide) and there charged with having caused the death of the ox, for which it was thrown into the sea. Apparently this is an early instance analogous to deodand (q.v.). The ox itself was probably the embodiment of the corn-spirit, and therefore its slaughter was regarded as murder.

**BIBLIOGRAPHY.**—See W. Robertson Smith, *The Religion of the Semites* (1894); J. G. Frazer, *The Golden Bough* (abridged edition, 1922); J. E. Harrison, *Prolegomena to the Study of Greek Religion* (1922).

**BUR** or **BURR**, a prickly fruit or head of fruits, as of the burdock. Also a woody outgrowth on the trunk of a tree, the effect of a crowded bud-development.

**BURAUEN**, a municipality (with administration centre and 30 barrios or districts) of the province and island of Leyte, Philippine Islands, on the Dagitan river, 21 m. S. by W. of Tacloban, the provincial capital. Pop. (1918), 25,647, of whom 13,442 were males and 8 whites. The municipality is located in a rich abaca-growing region and abaca is its only important product. In 1918 it had nine manufacturing establishments with output valued at 72,400 pesos, besides 52 household industry establishments with output valued at 24,800 pesos; and 14 schools, of which 13 are public. The language is a dialect of Bisayan.

**BURBAGE, JAMES** (d. 1597), English actor, is said to have been born at Stratford-on-Avon. He was a member of the

earl of Leicester's players, probably for several years before he is first mentioned (1574), as being at the head of the company. In 1576, having secured the lease of land at Shoreditch, Burbage erected there the successful house which was known for 20 years as *The Theatre* from the fact that it was the first ever erected in London. He seems also to have been concerned in the erection of a second theatre in the same locality, the Curtain, and later, in spite of all difficulties and a great deal of local opposition, he started what became the most celebrated home of the rising drama—the Blackfriars theatre, built in 1596 near the old Dominican friary.

His son **RICHARD BURBAGE** (c. 1567–1619), more celebrated than his father, was the Garrick of the Elizabethan stage, and acted every one of the great parts in Shakespeare's plays. He had established a reputation by the time he was 20, and in the next dozen years was the most popular English actor, the "Roscius" of his day. At the time of his father's death, a lawsuit was in progress against the lessor from whom James Burbage held the land on which *The Theatre* stood. This suit was continued by Richard and his brother Cuthbert, and in 1599 they pulled down the Shoreditch house and used the materials to erect the Globe theatre, famous for its connection with Shakespeare. They occupied it as a summer playhouse, retaining the Blackfriars, which was roofed in, for winter performances. In this venture Richard Burbage had Shakespeare and others as his partners, and it was in one or the other of these houses that he gained his greatest triumphs, taking the leading part in almost every new play. He was specially famous for his impersonation of Richard III. and other Shakespearian characters, and it was in tragedy that he especially excelled. Every playwright of his day endeavoured to secure his services. He died on March 13 1619. Richard Burbage was a painter as well as an actor. The Felton portrait of Shakespeare is attributed to him, and there is a portrait of a woman, undoubtedly by him, preserved at Dulwich college, London.

**BURBANK, LUTHER** (1849–1926), famous American plant breeder, was born at Lancaster, Mass., on March 7, 1849. He attended the public schools until 15 years of age, and then spent four winters in Lancaster academy. Outside of school he learned much about plant life on a farm, and found in the Lancaster library a copy of Darwin's *Variation of Animals and Plants under Domestication*, the reading of which marked a turning point in his career. Under its stimulus he obtained and read other books by Darwin as well as a number of miscellaneous scientific books. At the age of 21 he bought a 17 ac. tract of land near Lunenburg, Mass., and began his life-work of plant breeding. His most important early achievement was the development of the Burbank potato (1872).

He continued his work at Lunenburg until 1875, when he removed to California, where his three elder brothers had already gone. He settled in Santa Rosa, which he describes, in a letter to his mother, as "the chosen spot of all this earth as far as Nature is concerned." In this earthly paradise he soon established a little nursery garden with greenhouse, which was to become famous the world over and in which, with certain added acres near another town a few miles away, he was to carry on uninterruptedly his experimental and creative work for 50 years. Here he developed that long series of "new creations," as he called them, of fruits, flowers, vegetables, grains and grasses which are associated with his name.

Burbank's work involved experimentation with thousands of kinds of plants and the experimental rearing of hundreds of thousands of plant individuals. It was not conducted to prove or test any particular scientific theories or to make scientific discoveries, but had for its sole aim the production of more and better varieties of cultivated plants. "I shall be contented if, because of me, there shall be better fruits and fairer flowers," said Burbank.

Perhaps Burbank's longest attention was given to the development of new varieties of plums and prunes. This work ran through 40 years of experimentation. Next came his work with berries, which ran through about 35 years and involved the use of over 50 different species of the genus *Rubus* and resulted in

the origination and commercial introduction of ten or more useful new varieties. Among other fruits Burbank introduced numerous notable varieties of apples, cherries, peaches, quinces and nectarines. Among flowers he worked especially with lilies, using more than half a hundred varieties in his hybridizations and producing a brilliant array of new forms. Among vegetables, besides producing the Burbank and other new potatoes, he produced new tomatoes, sweet and field corn, squash, asparagus, peas, etc. One of his most extensive experiments was that extending through 16 years and resulting in the production of a series of luxuriantly growing spineless cacti, useful for feeding cattle in arid regions.

He became special lecturer on evolution at Stanford university and published *Luther Burbank, His Methods and Discoveries* (1914-15); *How Plants are Trained to Work for Man* (1921); and, with Wilbur Hall, *The Harvest of the Years* (1927). Of peculiar interest is Burbank's brief series of descriptive catalogues of his offered new plant varieties entitled *New Creations* (1893-1901).

He died at Santa Rosa, Calif., on April 11, 1926.

**BURBANK**, a city of Los Angeles county, California, U.S.A., in the San Fernando valley, 111 m. north-west of Los Angeles. It is served by the Southern Pacific railway. Natural gas and crude oil come in pipe lines from the Bakersfield district. There are numerous and varied industries, including motion picture studios. The city was incorporated in 1911. In 1920 the population was 2,913; in 1930 it was 16,662 by the Federal census. The assessed valuation of property in 1926 was \$14,586,398.

**BURBIDGE, SIR RICHARD** (1847-1917), British merchant, was born in Wiltshire March 2, 1847. At the age of 13 he was apprenticed to a provision merchant in Oxford street, London, and at 19 started in business of his own. Fourteen years later he became general superintendent of the Army and Navy Auxiliary Stores. In 1882 he was appointed general manager of Whiteley's, Westbourne Grove, and in 1891 entered the service of Harrods, Brompton road, of which he became managing director. Under him the stores became one of the largest in London. He anonymously presented about £30,000 to the fund for acquiring the Crystal Palace for the public in 1913. During the World War he was a member of the advisory committee of the Ministry of Munitions. He was created a baronet in 1916 and died in London May 31 1917.

See Mrs. A. C. Stuart Menzies, *Modern Men of Mark* (1920).

**BURBOT or EEL-POUT** (*Lota lota*), the only freshwater fish of the cod family. It is elongate, with long dorsal and anal fins meeting the rounded caudal; the head is broad and flat, the mouth wide; the body is spotted or marbled with brown or black. It inhabits Europe, Siberia, Alaska and Canada; in England it is found in east coast rivers from Durham to Norfolk. In Alaska it grows to 60 lb. It is a voracious fish, and most active at night.

**BURCKHARDT, JAKOB** (1818-1897), Swiss writer on art and social history, was born at Basle on May 25, 1818, and died there on Aug. 8, 1897. He studied (1839-43) at Berlin, spent part of 1841 at Bonn, where he was a pupil of Franz Kugler, the art historian, and in 1845 became professor of history in his native city. This position he held, with short intervals, until 1893. His principal works, all of which are important in the history of art criticism, are *Die Zeit Konstantins des Grossen* (1853; 4th ed. 1924); *Der Cicerone, eine Anleitung zum Genuss der Kunstwerke Italiens* (1855; reprint 3 vols. 1925; Eng. trans. of part, 1873); *Die Kultur der Renaissance in Italien* (1860; 14th ed. 1925; Eng. trans. 1878); *Geschichte der Renaissance in Italien* (1867; 7th ed. 1924). Burckhardt's great book on the Italian Renaissance, was the first comprehensive survey of its kind.

See a biographical sketch by Hans Trog in the *Basler Handbuch* (1898); Joel, *Jakob Burckhardt als Geschichtsphilosoph* (1918); two volumes of correspondence posthumously published: *Briefe an einen Architekten* (1913), and *Briefwechsel mit Paul Heyse* (1916). An important posthumous work is *Griechische Kulturegeschichte* (1898-1902).

**BURCKHARDT, JOHN LEWIS** (JOHANN LUDWIG) (1784-1817), Swiss traveller and orientalist, was born at Lausanne on Nov. 24, 1784. After studying at Leipzig and Göttingen he visited England in the summer of 1806, carrying a letter of introduction from the naturalist Blumenbach to Sir Joseph Banks, who, with the other members of the African Association, accepted his offer to explore the interior of Africa. After studying in London and Cambridge, and inuring himself to all kinds of hardships and privations, Burckhardt left England in March 1809 for Malta, whence he proceeded, in the following autumn, to Aleppo. He disguised himself as a Muslim, and took the name of Ibrahim Ibn Abdallah. He mastered Arabic and acquired such accurate knowledge of the Koran, and of the commentaries upon its religion and laws, that the most learned Muslims entertained no doubt of his being really what he professed to be, a learned doctor of their law. During his residence in Syria he visited Palmyra, Damascus, Lebanon and thence journeyed via Petra to Cairo with the intention of joining a caravan to Fezzan, and of exploring from there the sources of the Niger. In 1813 whilst waiting for the departure of the caravan, he travelled up the Nile as far as Dar Mahass; and then, finding it impossible to penetrate westward, he made a journey through the Nubian desert in the character of a poor Syrian merchant, passing by Berber and Shendi to Suakin, on the Red sea, whence he performed the pilgrimage to Mecca by way of Jidda. At Mecca he stayed three months and afterwards visited Medina. He returned to Cairo in June 1815 in a state of great exhaustion; but in the spring of 1816 he travelled to Mt. Sinai, whence he returned to Cairo in June, and there again made preparations for his intended journey to Fezzan. Finally, in April 1817, when the long-expected caravan prepared to depart, he was seized with illness and died on Oct. 15. He bequeathed his collection of 800 vols. of oriental mss. to the library of Cambridge university.

His works were published by the African Association in the following order: *Travels in Nubia* (to which is prefixed a biographical memoir, 1819); *Travels in Syria and the Holy Land* (1822); *Travels in Arabia* (1829); *Arabic Proverbs, or the Manners and Customs of the Modern Egyptians* (1830); *Notes on the Bedouins and Wahabys* (1830).

**BURDEN or BURTHEN.** (1) A load, both literally and figuratively (A.S. *byrthen*, from *beran*, to bear); the carrying capacity of a ship; in mining and smelting, the tops or heads of stream-work which lie over the stream of tin, and the proportion of ore and flux to fuel in the charge of a blast-furnace. In Scots and English law, an encumbrance on real or personal property. (2) An accompaniment to a song, or the refrain of a song (Fr. *bourdon*, a droning, humming sound); hence a recurrent topic, as "the burden of a speech."

**BURDER, GEORGE** (1752-1832), English divine, was born in London. He held charges at Lancaster (1778-83), Coventry (1784-1803), and at Fetter Lane, London (1803-32). He was one of the founders of the British and Foreign Bible Society, the Religious Tract Society, and the London Missionary Society, and was secretary to the last-named for several years. As author of *Village Sermons*, which had a vast circulation, he commanded a wide influence.

See his *Life* by H. Burder (1833).

**BURDETT, SIR FRANCIS** (1770-1844), English politician, was born on Jan. 25, 1770. He was in Paris during the earlier days of the French Revolution, a visit which doubtless influenced his political opinions. Returning to England he married in 1793 Sophia the enormously rich daughter of Thomas Coutts the banker. In 1796 he became member of parliament for Boroughbridge, having purchased this seat from the representatives of the 4th duke of Newcastle, and in 1797 succeeded his grandfather as fifth baronet. In parliament he denounced the war with France, the suspension of the Habeas Corpus act, the proposed exclusion of John Horne Tooke from parliament, and quickly became the idol of the people. He was instrumental in

securing an enquiry into the condition of Coldbath Fields prison, but as a result of this step he was for a time prevented by the government from visiting any prison in the kingdom. Between 1802 and 1805 he twice took his seat for Middlesex and was twice unseated. In 1806 he was wounded in a duel with James Paull, radical candidate for Westminster. In 1807 Burdett, in spite of his reluctance, was elected for Westminster. He took up again his work of attacking abuses and agitating for reform, and in 1810 came sharply into collision with the House of Commons. A radical named John Gale Jones had been committed to prison by the House, a proceeding which was denounced by Burdett, who questioned the power of the House to take this step. A revised edition of his speech on this occasion was published by William Cobbett in the *Weekly Register*. The House voted this action a breach of privilege, and the speaker issued a warrant for Burdett's arrest. Barring himself in his house, he defied the authorities, while the Londoners gathered in his defence. Preparations, including a large supply of gunpowder, were made for fierce conflict with the authorities, which it was suggested Lord Cochrane would conduct. Sir Francis, however, refused to countenance armed conflict, and permitted the entry of the government troops. The soldiers marched into his room where he was discovered instructing his son in the Latin of *Magna Carta*; they surrounded him and conveyed him dramatically to the Tower. Released when parliament was prorogued, he caused his supporters much disappointment by returning to Westminster by water, and so avoiding a demonstration in his honour. He then brought actions against the Speaker and the serjeant-at-arms, but the courts upheld the action of the House. In parliament Burdett denounced corporal punishment in the army, and supported all attempts to check corruption, but his principal efforts were directed towards procuring a reform of parliament, and the removal of Roman Catholic disabilities. In 1809, 1817 and 1818, he in vain pressed for parliamentary reform, and in 1825, 1827 and 1828 continued his efforts on behalf of the Roman Catholics, which were successful in 1829. In 1820 Burdett severely censured the government's action at Peterloo (*q.v.*); he was prosecuted at Leicester assizes, fined £1,000, and committed to prison for three months. Long before the passing of the Reform Bill of 1832 Sir Francis' zeal for reform and his enthusiasm for extirpating abuses had diminished. He separated himself from the reformers in personal intercourse and lost the confidence of his one-time colleagues. In 1837 he left Westminster and was elected for North Wiltshire. Thereafter he voted and worked with the Conservatives in Parliament until his death on Jan. 23, 1844.

**BURDETT-COUTTS, ANGELA GEORGINA BURDETT-COUTTS**, BARONESS (1814-1906), English philanthropist, youngest daughter of Sir Francis Burdett, was born on April 21, 1814 at 80, Piccadilly, London. Much of her girlhood was spent at her father's town house in St. James's place, and there she met Disraeli, Tom Moore, Samuel Rogers, and others who became life-long friends. When she was 23, she inherited practically the whole fortune of her grandfather, Thomas Coutts, by the will of the duchess of St. Albans, who, as the actress Henrietta Mellon, had been his second wife and had been left it on his death in 1821. Miss Burdett then took the name of Coutts in addition to her own. "The faymale heiress, Miss Anjaley Coutts," as the author of the *Ingoldsby Legends* called her in his ballad on the queen's coronation in that year (1837), devoted herself and her riches to philanthropic work. She had removed in 1837 to the famous house at 1, Stratton street, Piccadilly, taking with her her friend and inseparable companion, Hannah Meredith (Mrs. Brown). In May 1871 she was created a peeress, as Baroness Burdett-Coutts of Highgate and Brookfield, Middlesex. On July 18, 1872 she was presented at the Guildhall with the freedom of the city of London, the first case of a woman being admitted to that fellowship. In 1881, at the age of 67, she married William Lehman Ashmead-Bartlett, an American by birth, afterwards Unionist member of parliament. Mr. Ashmead-Bartlett assumed his wife's name. He had been closely associated with her philanthropic work before his marriage, and for the rest of her life

continued to assist her. The baroness lived to the great age of 92, dying at her house in Stratton street, Piccadilly, on Dec. 30, 1906. She was buried in Westminster Abbey.

The baroness was an extremely able business woman, and conducted her various great philanthropic enterprises herself. Moreover, she sought to do real constructive work in housing, markets, and the establishment of industries. She carefully avoided taking any side in party politics, but she was actively interested in phases of Imperial extension which were calculated to improve the condition of the black races, as in Africa, or the education and relief of the poor or suffering in any part of the world. Though she made no special distinction of creed in her charities, she was a notable benefactor of the Church of England, building and endowing churches and church schools, endowing the bishoprics of Cape Town and of Adelaide (1847), and founding the bishopric of British Columbia (1857). Among her many educational endowments may be specified the St. Stephen's institute in Vincent square, Westminster (1846); she started sewing schools in Spitalfields when the silk trade began to fail; helped to found the shoe-black brigade; and placed hundreds of destitute boys in training-ships for the navy and merchant service. She established Columbia fish market (1869) in Bethnal Green and presented it to the city, but owing to the rivalry of existing vested interests this effort, which cost her over £200,000, proved abortive. She supported various schemes of emigration to the colonies. In Ireland she helped to promote the fishing industry by starting schools and providing boats. She sought to relieve distress in congested districts of western Ireland by establishing peasant industries. She helped to form the Society for the Prevention of Cruelty to Children, and was a keen supporter of the ragged school union. She was also associated with Louisa Twining and Florence Nightingale; and in 1877-78 raised the Turkish compassionate fund for the starving peasantry and fugitives in the Russo-Turkish War (for which she obtained the order of the Medjidieh, a solitary case of its conferment on a woman). She was the friend of many famous men and women of her time, in art, literature, and science, of Charles Dickens and of Faraday, among many others. Dickens often acted as her almoner. In short, her position in England for half a century may well be summed up in words attributed to King Edward VII., "after my mother (Queen Victoria) the most remarkable woman in the kingdom." She was indeed a "British institution," and became a legend during her lifetime.

See *Baroness Burdett-Coutts: a sketch of her public life and work*, with a preface by Princess Mary Adelaide, Duchess of Teck (Chicago, 1893). There are many references to her in the memoirs of her contemporaries.

**BURDON-SANDERSON, SIR JOHN SCOTT**, BART. (1828-1905), Regius Professor of Medicine at Oxford, was born at West Jesmond, near Newcastle, on Dec. 21, 1828. Educated at the University of Edinburgh and at Paris, he became in 1860 medical inspector under the privy council, in which capacity he carried out important inquiries which foreshadowed the direct relation between specific micro-organisms and certain diseases. In 1874 he was appointed Jodrell professor of physiology at University college, London, retaining that post till 1882, when he took the Waynflete chair of physiology at Oxford. In 1882 the Royal Society awarded him a royal medal in recognition of his researches into the electrical phenomena exhibited by plants and the relations of minute organisms to disease, and of the services he had rendered to physiology and pathology. In 1895 Sanderson was appointed regius professor of medicine at Oxford. He served on three royal commissions—Hospitals (1883), Tuberculosis, Meat and Milk (1890), and University for London (1892). He died at Oxford on Nov. 23, 1905.

Sanderson may be regarded as the founder of the modern medical school at Oxford. He introduced new methods of teaching.

See *Memoir of Sir J. Burdon-Sanderson*, with a selection from his papers and addresses, by Lady Burdon-Sanderson, J. S. Haldane and E. S. Haldane (1911).

**BURDWAN**, a town of British India, in Bengal, which gives its name to a district and to a division. Pop. (1921) 34,616. The

town includes numerous villages scattered over an area of 9sq.m., and is mainly rural in character. The principal objects of interest are the Burdwan Raj palace and gardens; and several interesting ancient tombs; at Nawab Hat, some 2m. distant, is a group of 108 Siva *lingam* temples built in 1788. The place was formerly very unhealthy and suffered after 1862 from a virulent type of fever called "Burdwan fever," but its health improved after the establishment of water works, in 1884.

The town is the headquarters of the Maharajahdhiraj Bahadur of Burdwan, who ranks first in wealth and importance among the Zamindars of Bengal. The *raj* was founded in 1657 by Abu Rai Kapur, who migrated to Burdwan from the Punjab. One of the most distinguished of his descendants was Maharaja Mahtab Chand, whose loyalty to the government was rewarded with the grant of a coat of arms in 1868 and the right to a personal salute of 13 guns in 1877. The present head of the house is Sir Bijay Chand Mahtab Maharajahdhiraj Bahadur of Burdwan, G.C.I.E., K.C.S.I., I.O.M. (b. 1881), who was installed in 1903 and five years later was made a member of the Indian Order of Merit in recognition of the courage with which he risked his life to save that of Sir Andrew Fraser, the lieutenant governor of Bengal, on the occasion of an attempt to assassinate him made by a Bengali. He was a member of the Bengal Executive Council from 1919 to 1924, and was one of the representatives of India at the Imperial Conference in 1926.

The District of Burdwan lies along the right bank of the river Bhagirathi or Hooghly. It has an area of 2,703sq.m. and a population of 1,438,926. The east is a low-lying alluvial plain, subject to inundation from the river Damodar. The west of the district comprising the Asansol subdivision, consists of rolling uplands with a dry lateritic soil. The former tract is entirely agricultural, the latter largely industrial. It contains the greater part of the Raniganj coal-field, with an output of more than four million tons, and the Bengal Iron company and the Indian Iron and Steel company ironworks. The subdivisional town of Asansol (pop. 26,499) is an important railway junction and the centre of the Raniganj coal-field. Raniganj (pop. 14,536), which contains large pottery works, was the headquarters of the subdivision till 1906.

The Division of Burdwan comprises the six districts of Burdwan, Birbhum, Bankura, Midnapore, Hooghly and Howrah, with a total area of 13,854sq.m., and a population in 1921 of 8,050,642.

**BUREAU**, a writing-table or desk (from Fr. *burel* or *bureau*, a coarse cloth). From the meaning of "desk," the word is applied to an office or place of business, and particularly a government department; in the United States the term is used of certain subdivisions of the executive departments; e.g., the bureau of statistics, a division of the treasury department. The term "bureaucracy" signifies the concentration of administrative power in bureaux or departments, and the undue interference by officials in matters outside the scope of state interference.

**BUREAU VERITAS:** see SHIPPING: *Registration, Classification and State Regulation.*

**BURFORD**, market town, Oxfordshire, England. Along the ridge flanking the valley of the Windrush on the south as it leaves the Cotswolds and enters the Oxford basin runs the Oxford-Cheltenham road, whence the main street of Burford slopes down to the river. Population (1921) 987. A synod at Burford in 705 is chronicled. The Mercians were defeated here by the West Saxons under Cuthred (752) and Cromwell gained successes here in the Civil War.

The church of St. John the Baptist has a massive Norman tower with a delicate Perpendicular spire. The nave and aisles are mainly Perpendicular in appearance but are of earlier construction. Among notable old buildings in the High street is the Tolsey or old town hall.

**BURG**, a town of Germany, in Prussian Saxony, 14m. N.E. of Magdeburg. Pop. (1925) 24,320. It belonged originally to the lordship of Querfurt, passed with this to the archbishops of Magdeburg in 1496, and was ceded in 1635 with other portions of the Magdeburg territories to Saxony; in 1687 it was ceded to Brandenburg. It profited by the large influx of industrious French, Palatinate and Walloon refugees at the end of the 17th

century. Its cloth and boot manufactures are noteworthy and it also produces asphalt, starch, soap and cardboard.

**BURGAGE**, a form of tenure, both in England and Scotland, applicable to the property connected with the old municipal corporations and their privileges. In England, it was a tenure whereby houses or tenements in an ancient borough were held of the king or other person as lord at a certain rent. The term is of less practical importance in the English than in the Scottish system, where it held an important place in the practice of conveyancing, real property having been generally divided into feudal-holding and burgage-holding. Since the Conveyancing (Scotland) Act 1874, there is, however, not much distinction between burgage-tenure and free holding. It is usual to speak of the English burgage-tenure as a relic of Saxon freedom resisting the shock of the Norman conquest and its feudalism, but it is perhaps more correct to consider it a local feature of that general exemption from feudality enjoyed by the *municipia* as a relic of their ancient Roman constitution. It persisted as a distinct form in Scottish conveyancing because burgage-holding was an exception to the system of subinfeudation which remained prevalent in Scotland when it was suppressed in England. While other vassals might hold of a graduated hierarchy of overlords up to the crown, the burgess always held directly of the sovereign. It is curious that while in England the burgage-tenure was deemed a species of socage (*q.v.*), to distinguish it from the military holdings, in Scotland it was strictly a military holding, by the service of watching and warding for the defence of the burgh. In England the franchises enjoyed by burgesses, freemen and other consuetudinary constituencies in burghs, were dependent on the character of the burgage-tenure. Tenure by burgage was subject to a variety of customs, the principal of which was Borough-English (*q.v.*).

See Pollock and Maitland, *History of English Law* (1898); W. S. Holdsworth, *History of English Law* (1922-26).

**BURGAS**, the mediaeval Pyrgos, a seaport and the capital of Burgas department, S.E. Bulgaria. Pop. (1926), 31,428. Burgas lies on an inlet of the Black Sea, on a low fore-land, between the lagoons of Ludzha on the north and Kara-Yunus on the west. It faces open sea on the east, its own harbour on the south. It is connected by rail with Philippopolis and the main European network, and by light railway with Anhiolo. The harbour, formally opened in 1904, has an average depth of five fathoms; large vessels can load at its quays, and the outer waters of the gulf are well lighted by lighthouses on the islets of Hagios Anastasios and Megalo-Nisi. After the World War it began to rival Varna as the chief port of Bulgaria, surpassing it in the grain trade. There is an important trade in grain, wool, tallow, cheese, butter, textiles, eggs and tobacco. In and near the town are flour mills, a sugar factory, soap factories, etc. There is a chamber of commerce, numerous foreign consulates, a commercial school, a boys' and a girls' high school. In 1921, 1,200 vessels, of 622,835 tonnage, entered the harbour, through which passed 40% of Black Sea trade of Bulgaria. The modern town has few picturesque buildings.

**BURGDORF**, an industrial town in the Swiss canton of Berne, on the left bank of the Emme, 14m. N.E. of Berne. (Fr. Berthoud). The lower (or modern) town is connected by a spiral street with the old town, picturesquely perched on a hill (1,942ft. above sea-level or 167ft. above the river), crowned by the 15th century parish church and by the ancient castle in which Pestalozzi set up his educational establishment between 1799 and 1804. Cheese of the Emmenthal is an article of trade, and there are railway works, and factories of cloth, white lead and tinfoil. Burgdorf has a cantonal technical institute. In 1920 the population was 9,447, practically all Protestants and German-speaking. A fine view of the Bernese Alps is obtained from the castle, which dates from the days of the dukes of Züringen (11th-12th centuries), the last of whom (Berchtold V.) built walls round the town, and granted it a charter of liberties. Castle and town were sold, together with Thun, in 1384, to the town of Berne, whose bailiffs ruled in the castle till 1798.

See Aeschlimann, *Geschichte v. Burgdorf* (1847); Türlér, *Das Schloss B.* (in N. Bern. Taschenbuch, 1922).

**BURGENLAND**, a province of Austria (*q.v.*) that by reason of its situation has experienced a very disturbed history which is reflected in the speech of its modern population (German, 226,891; Croat, 42,010; Magyar, 14,971; others, 1,919). The foundations of its settlement are embedded in the early culture of the Danube (*q.v.*), and upon these has been built a composite structure in which German, Magyar and Slav influences are mingled. From 1491–1647 it was under direct control of Austria but was mortgaged in the latter year to Hungary, which returned it with the exception of the old capital, Sopron, in 1921.

Physically it comprises detached outliers and low promontories of the dying Alpine ranges. Inliers of primary strata and volcanic rocks appear but in general a thick covering of soft tertiary deposits with occasional stretches of loess hides the older formations. The northern half of the region (the "Seegau") falls quickly from the Leitha mountains (1,560ft.) and Rosalien mountains through a fertile, vine-clad, terraced landscape to the reed flats of the western shore of Lake Neusiedl, beyond which stretches a marshy gravel plain with extensive *puszta* pastures that support large numbers of cattle, pigs and poultry. By contrast, the southern half (the "Raabgau") is more undulating and is cut into a series of strips, oriented north-west to south-east by the Raab and its tributaries. In both regions agriculture and forestry are the foundations of human prosperity; Burgenland exceeds all other Austrian provinces in its proportion of productive land, 89.8% of its area, and of this 50.9% is arable, 3.2% is meadowland and 28.3% is forest. Almost every settlement has its strip of pasture along the valley-floor, cultivated strips on the lower terraces and slopes, vineyards and orchards on the steeper sides, and above these the forest. In the north and east, low relief and climatic conditions that include a short, cold winter, a long, hot summer (mean annual temperature, 48°F to 50°F) and a rainfall less than 16in. per annum, are specially favourable to agriculture. Wheat, rye, barley, oats, maize, buckwheat and millet are the important cereals, while sugarbeet, potatoes and leguminous plants are produced in excess of local needs. Hemp in the lowlands and flax in the hilly districts vie with wood and reeds as raw materials for widespread but declining home industries. Lignite, antimony, sulphur and limestone are worked in small quantities but no important development of manufacture has arisen. Minor industries, *e.g.*, the weaving of coarse woollens at Pinkafeld (pop. 2,580) and the preparation of safety-matches at Neudörfel, are scattered along the western frontier particularly near the Wiener-Neustadt valley, but, with the exception of housecrafts mentioned above and the preparation of beet-sugar in two local factories, raw materials are exported to other parts of Austria for treatment; thus a large proportion of the fruit and timber moves to the distilleries and factories respectively of Vienna and Lower Austria.

This rich and fertile land is well-peopled and settlement is evenly distributed upon small-holdings, with minor concentrations in tiny market towns, *e.g.*, Eisenstadt, the new capital (pop. c. 5,000), Neusiedl-am-See (2,760), Deutschkreutz (3,320) and Oberwart (3,850), each of which serves its immediate surroundings. In some cases, notably Sauerbrunn (1,360) and Neusiedl-am-See, local circumstances such as the presence of thermal springs or other attractions give extra-regional importance to a town, but such health and pleasure resorts do not yet enjoy wide popularity. Both north and south have lost their larger markets, Sopron and Szombathely respectively, upon which the rather inadequate rail services of each converge, and Austria is faced with the difficult task of reorganizing the outlets and outlook of this addition to its territory.

See H. Güttenburger, "Der anthropogeographische Aufriss des Burgenlandes," *Mitt. d. Geogr. Gesellsch.* (Vienna, 1922), and "Burgenland," *Festschrift*, herausg. von E. Stepan (Vienna, 1920).

(W. S. L.)

#### HISTORY

The Treaties of Saint-Germain and Trianon envisaged the cession by Hungary to Austria of the German-speaking districts of West Hungary, with their centre Sopron (Oedenburg). Hungary should have handled the districts over on Aug. 9, 1921; instead

she organized a violent propaganda against the transfer, and semi-irregular armed bands attacked the Austrian gendarmerie when it tried to take possession. The Inter-Allied Commission in charge appealed to the Council of Ambassadors; Italy offered her mediation, and on Oct. 13 Italy, Austria and Hungary signed a protocol at Venice, agreeing to a plebiscite being held in Sopron and the surrounding districts. Held on Dec. 14 and 19, this gave a Hungarian majority. Austria protested that the voters had been terrorized and the lists manipulated, but the Council of Ambassadors recognized the decision (Dec. 23) and persuaded Austria to do likewise (Feb. 28, 1922). Sopron remained with Hungary, and Austria entered into her new province in a mutilated form and lacking a natural centre. Eisenstadt was made its capital in 1925.

See A. J. Toynbee, *Journal of International Affairs*, 1919–23 (1925).

**BÜRGER, GOTTFRIED AUGUST** (1747–1794), German poet of the Romantic school, was born at Molmerswende, near Halberstadt, on Dec. 31, 1747, the son of a pastor. His maternal grandfather sent him to the University of Halle and then to Göttingen to study law, but withdrew his support at Göttingen on account of the young man's irregular life. He became attached to, though not actually a member of, the group of young romanticists known as the Göttinger Hain, which included Voss, the counts Stolberg, Hölz and others, and his first poems were published in the *Musen Almanach*, edited at Göttingen by Boie and Gotter. In 1772, through Boie's influence, Bürger obtained the post of "Amtmann" or district magistrate at Altengleichen near Göttingen. His grandfather now paid his debts. In 1773 the ballad *Lenore* was published in the *Musen Almanach*. This vivid and dramatic poem made his name a household word in Germany. In 1774 Bürger married Dorette Leonhart, daughter of a Hanoverian official. In 1778 Bürger became editor of the *Musen Almanach* and in the same year published the first collection of his poems. Pecuniary troubles oppressed him, and being accused of neglecting his official duties, and feeling his honour attacked, he gave up his position and in 1784 went to Göttingen, where he established himself as *Privat-docent*. Shortly before, his wife died on July 30, 1784, and on June 29, 1785, he married his sister-in-law "Molly." Her death on Jan. 9, 1786, affected him very deeply. He still continued to teach in Göttingen; at the jubilee of the foundation of the university in 1787 he was made an honorary doctor of philosophy, and in 1789 was appointed extraordinary professor in that faculty, though without a stipend. In the following year he married Elise Hahn. Only a few weeks of married life with his "Schwabenmädchen" sufficed to prove his mistake, and after two and a half years he divorced her. Deeply wounded by Schiller's criticism, in the 14th and 15th part of the *Allgemeine Literaturzeitung* of 1791, of the 2nd edition of his poems, disappointed, wrecked in fortune and health, Bürger eked out a precarious existence as a teacher in Göttingen until his death there on June 8, 1794.

Bürger was honest in purpose, generous to a fault, tender-hearted and modest. His lyric gift was very great, and in the romantic ballad he created a new genre, and found imitators both in Germany and in England. *Lenore*, *Das Lied vom braven Manne*, *Die Kuh*, *Der Kaiser und der Abt* and *Der wilde Jäger* are the classical examples. Among his purely lyrical poems, *Das Blümchen Wunderhold* and *Lied an den lieben Mond* found a place in many anthologies.

Editions of Bürger's *Sämtliche Schriften* appeared at Göttingen, 1817 (incomplete); 1829–33 (8 vols.), and 1835 (1 vol.); later editions by E. Griesbach (5th ed., 1894); W. von Wurzbach (4 vols. 1902). The *Gedichte* have been published in innumerable editions, by A. Sauer (2 vols. 1884), Consentius (1914) and others. *Briefe von und an Bürger* were edited by A. Strodtmann in 4 vols. (1874). On Bürger's life see the introduction to Sauer's edition of the poems, and W. von Wurzbach, *G. A. Bürger* (1900).

**BURGERS, THOMAS FRANÇOIS** (1834–1881), president of the Transvaal Republic, was born in Cape Colony on April 15, 1834, and was educated at Utrecht, Holland, where he graduated doctor in theology. On his return to South Africa he was ordained minister of the Dutch Reformed Church, and stationed at Hanover in Cape Colony. In 1864 an ecclesiastical tribunal suspended him for heretical opinions. He appealed to

the colonial government, which had appointed him, and obtained judgment in his favour, which was confirmed by the privy council of England on appeal in 1865. On the resignation of M. W. Pretorius and the refusal of President Brand of the Orange Free State to accept the office, Burgers was elected president of the Transvaal, taking the oath on July 1, 1872. In 1873 he endeavoured to persuade Montsioa to agree to an alteration in the boundary of the Barolong territory as fixed by the Keate award, but failed (see BECHUANALAND). In 1875 Burgers, leaving the Transvaal in charge of Acting-President Joubert, went to Europe mainly to promote a scheme for linking the Transvaal to the coast by a railway from Delagoa bay, which was that year definitely assigned to Portugal by the MacMahon award. With the Portuguese Burgers concluded a treaty, in Dec. 1875, providing for the construction of the railway. In June 1876 he induced the raad to declare war against Sikukuni (Secocoeni), a powerful native chief in the eastern Transvaal. The campaign was unsuccessful, and with its failure the republic fell into a condition of lawlessness and insolvency, while a Zulu host threatened invasion. Sir Theophilus Shepstone, who had been sent to investigate the condition of affairs in the Transvaal, issued April 12 a proclamation annexing the Transvaal to Great Britain. Burgers fully acquiesced in the necessity for annexation. He accepted a pension from the British government, and settled down to farming in Hanover, Cape Colony. He died at Richmond in that colony on Dec. 6, 1881 (see TRANSVAAL: History).

**BURGES, GEORGE** (1786–1864), English classical scholar, was born in India. He had a great reputation as a Greek scholar, and was a somewhat acrimonious critic of rival scholars, especially Bishop Blomfield. He was a man of great learning and industry, but too fond of introducing arbitrary emendations into the text of classical authors. His chief works are: Euripides' *Troades* (1807) and *Phoenissae* (1809); Aeschylus' *Supplikes* (1821), *Eumenides* (1822) and *Prometheus* (1831); Sophocles' *Philoctetes* (1833); E. F. Poppo's *Prolegomena to Thucydides* (1837), an abridged translation with critical remarks; *Hermesianactis Fragmenta* (1839). He also edited some of the dialogues of Plato with English notes, and translated nearly the whole of that author and the Greek anthology for Bohn's Classical library. He was a frequent contributor to the *Classical Journal* and other periodicals, and dedicated to Byron a play called *The Son of Erin* or *The Cause of the Greeks* (1823).

**BURGESS**, a term, in its earliest sense, meaning an inhabitant of a borough, one who occupied a tenement therein, such tenement, unlike the county freeholds, being devisable by will and constituting "burgage-tenure," but now applied solely to a registered parliamentary, or more strictly, municipal voter. In some of the American colonies (e.g., Virginia), a "burgess" was a member of the legislative body, which was termed the "House of Burgesses." The *Burgess-roll* is the register or official list of burgesses in a borough. In English local government law, all the burgesses, and not merely the mayor and town council, are members of the municipal corporation.

**BURGH** (BOURKE, BURKE), the name of an historic Irish house, associated with Connaught for more than seven centuries. It was founded by William de Burgh, brother of Hubert de Burgh (q.v.). Before the death of Henry II. (1189) he received a grant of lands from John as lord of Ireland. At John's accession (1199) he was installed in Thomond and was governor of Limerick. In 1199–1201 he was supporting in turn Cathal Carrach and Cathal Crowderg for the native throne, but he was expelled from Limerick in 1203, and, losing his Connaught, though not his Munster, estates, died in 1205. His son Richard, in 1227, received the land of "Connok" (Connaught), as forfeited by its king, whom he helped to fight. From 1228 to 1232 he held the high office of justiciar of Ireland. In 1234 he sided with the crown against Richard, earl marshal, who fell in battle against him. Dying in 1243, he was succeeded as lord of Connaught by his son Richard, and then (1248) by his younger son Walter, who carried on the family warfare against the native chieftains, and added greatly to his vast domains by obtaining (c. 1255) from Prince Edward a grant of "the county of Ulster," in consequence of

which he was styled later earl of Ulster. At his death in 1271, he was succeeded by his son Richard as 2nd earl. In 1286 Richard ravaged and subdued Connaught, and deposed Bryan O'Neill as chief native king, substituting a nominee of his own. He also attacked the native king of Connaught in favour of that branch of the O'Conors whom his own family supported. He led his forces from Ireland to support Edward I. in his Scottish campaigns, and on Edward Bruce's invasion of Ulster in 1315 Richard marched against him, but he had given his daughter Elizabeth in marriage to Robert Bruce, afterwards king of Scotland, about 1304. Occasionally summoned to English parliaments, he spent most of his 40 years of activity in Ireland, where he was the greatest noble of his day, usually fighting the natives or his Anglo-Norman rivals, the Geraldines. The patent roll of 1290 shows that in addition to his lands in Ulster, Connaught and Munster, he had held the Isle of Man, but had surrendered it to the king.

His grandson and successor William, the 3rd earl (1326–1333), was the son of John de Burgh by Elizabeth, lady of Clare, sister and co-heir of the last Clare, earl of Hertford (d. 1314). He married a daughter of Henry, earl of Lancaster, and was appointed lieutenant of Ireland in 1331, but was murdered in his 21st year, leaving a daughter, the sole heiress, not only of the de Burgh possessions but of vast Clare estates. She was married in childhood to Lionel, son of Edward III., who was recognized in her right as earl of Ulster, and their direct representative, the duke of York, ascended the throne in 1461 as Edward IV., since when the earldom of Ulster has been held by members of the royal family only.

On the murder of the third earl in 1333, however, his male kinsmen succeeded in holding the bulk of the Burgh territories, and adopting Irish names became virtually native chieftains. Their two main branches were those of "MacWilliam Eighter" in southern Connaught, later given the title of earls of Clanricarde (1543); and "MacWilliam Oughter" who from 1603 held their territory as the viscountcy of Mayo. (See CLANRICARDE, EARLS OF; MAYO, EARLS OF.)

The lords Burgh (or Borough) of Gainsborough (1487–1599) were a Lincolnshire family believed to be descended from a younger son of Hubert de Burgh. The 5th baron was lord deputy of Ireland in 1597, and his younger brother, Sir John (d. 1594), a distinguished soldier and sailor.

**BURGH, HUBERT DE** (d. 1243), chief justiciar of England in the reign of John and Henry III., entered the royal service in the reign of Richard I. Already in 1201 he was chamberlain to King John, the sheriff of three shires, the constable of Dover and Windsor Castles, the warden of the Cinque Ports and of the Welsh Marches. He served with John in the Continental wars which led up to the loss of Normandy. It was to his keeping that the king first entrusted the captive Arthur of Brittany. Coggeshall is our authority for the tale of Hubert's refusal to permit the mutilation of his prisoner; but his loyalty was not shaken by the subsequent murder of Arthur. In 1204 Hubert persisted in a long and obstinate defence of Chinon, at a time when nearly the whole of Poitou had passed into French hands. In 1213 he was appointed seneschal of Poitou.

Both before and after the issue of the Great Charter Hubert adhered loyally to the king; he was rewarded, in June 1215, with the office of chief justiciar, which he retained after the death of John and the election of William, the earl marshal, as regent. But, until the expulsion of the French from England, Hubert was entirely engaged with military affairs. He held Dover successfully through the darkest hour of John's fortunes; and his naval victory gained over Eustace the Monk, the noted privateer and admiral of Louis, in the Straits of Dover (Aug. 1217), compelled Louis to accept the treaty of Lambeth, under which he renounced his claims to the crown and evacuated England. The justiciar naturally assumed, after the death of William Marshal (1219), the leadership of the English loyalists. He was opposed by the legate Pandulf (1218–21), who claimed the guardianship of the kingdom for the Holy See; by the Poitevin Peter des Roches, bishop of Winchester, who was the young king's tutor; by the foreign mercenaries of John, among

whom Falkes de Bréauté took the lead; and by the feudal party under the earls of Chester and Albemarle. On Pandulf's departure the pope was induced to promise that no other legate should be appointed in the lifetime of Archbishop Stephen Langton. In 1223 the justiciar suddenly announced the resumption of all the castles, sheriffdoms, and other grants which had been made since the king's accession. A plausible excuse was found in the next year for issuing a sentence of confiscation and banishment against Falkes de Bréauté. Finally, in 1227, Hubert, having proclaimed the king of age, dismissed the bishop of Winchester from his tutorship.

Hubert now stood at the height of his power. His possessions had been enlarged by four successive marriages, particularly by that which he contracted in 1221 with Margaret, the sister of Alexander II. of Scotland; in 1227 he received the earldom of Kent which had been dormant since the disgrace of Odo of Bayeux. But Henry III. chafed against Hubert's objections to wild plans of foreign conquest and inconsiderate concessions to the papacy. They quarrelled violently in 1229 at Portsmouth, when a sufficient supply of ships was not forthcoming for an expedition to France. In 1231 Henry lent an ear to those who asserted that the justiciar had secretly encouraged armed attacks upon the aliens to whom the pope had given English benefices. Hubert was suddenly disgraced and required to render an account of his long administration. Some colour was given to the attacks of Peter des Roches and his nephew Peter des Rievaux by Hubert's injudicious plea that he held a charter from King John which exempted him from any liability to produce accounts. He was dragged from the sanctuary at Bury St. Edmunds, in which he had taken refuge, and was kept in strait confinement until Richard of Cornwall, the king's brother, and three other earls offered to be his sureties. On the outbreak of Richard Marshal's rebellion (1233), he was carried off by the rebels to the Marshal stronghold of Striguil, in the hope that his name would add popularity to their cause. In 1234 he was admitted, along with the other supporters of the fallen Marshal, to the benefit of a full pardon. He regained his earldom and held it till his death, although he was once in serious danger from the avarice of the king (1239), who was tempted by Hubert's enormous wealth to revive the charge of treason which had formerly been brought against him.

Hubert's ambition of founding a great family was not realized. His earldom died with him, though he left two sons. In constitutional history he is remembered as the last of the great justiciars. The office was now shorn of its most important powers and became politically insignificant.

**BURGH:** see **BOROUGH.**

**BURGHESH, HENRY** (1292-1340), English bishop and chancellor, was appointed bishop of Lincoln by Pope John XXII. in 1320, in spite of the fact that the chapter had already made an election. In 1322 his lands were seized by Edward II. and restored only in 1326. Burghersh took part in the movement which led to the deposition and murder of King Edward II., but became chancellor of England in 1328 under the new king, owing to the influence of Queen Isabella. On Isabella's disgrace in 1330 he lost his influence for a time, but was treasurer from 1334 to 1337, and was entrusted with many important commissions by the king.

His brother, Bartholomew, baron Burghersh (d. 1355), also enjoyed the confidence of Edward III., and fought at Crécy. His son, Bartholomew, was one of the original knights of the Garter, and fought at Poitiers in 1356.

**BURGHLEY, WILLIAM CECIL, BARON** (1521-1598), was born, according to his own statement, on Sept. 13, 1521, at Bourne, Lincolnshire, son of Richard Cecil (see **CECIL**).

William was put to school first at Grantham and then at Stamford. In May 1535, at the age of 14, he went up to St. John's college, Cambridge, where he was brought into contact with the foremost educationists of the time, Roger Ascham and John Cheke. There he fell deeply in love with Cheke's sister, Mary, and was in 1541 removed by his father to Gray's Inn, without, after six years' residence at Cambridge, having taken a degree. The precaution proved useless, and four months later Cecil committed one of the rare rash acts of his life in marrying Mary Cheke. The only child of this marriage, Thomas, the future earl of Exeter, was born in May 1542, and in February 1543 Cecil's first wife died. Three years later he married (Dec. 21, 1546) Mildred, daughter of Sir Anthony Cooke, who was ranked by Ascham with Lady Jane Grey as one of the two most learned ladies in the kingdom, and whose sister, Anne, became the wife of Sir Nicholas, and the mother of Sir Francis Bacon.

Cecil, meanwhile, had obtained the reversion to the office of *custos rotulorum brevium*, and, according to his autobiographical notes, sat in parliament in 1543; but his name does not occur in the imperfect parliamentary returns until 1547, when he was elected for the family borough of Stamford. Earlier in that year he had accompanied Protector Somerset on his Pinkie campaign, being one of the two "judges of the Marshalsea," i.e., in the courts-martial.

In 1548 he is described as the protector's master of requests, and was involved in the latter's fall (Oct. 1549). In November he was in the Tower, and on Jan. 25, 1550, he was bound over in recognizances to the value of a thousand marks. However, he soon ingratiated himself with Warwick, and on Sept. 15, 1550, he was sworn one of the king's two secretaries, and was knighted on Oct. 11, 1551. But service under Northumberland was no bed of roses. His responsibility for Edward's illegal "devise" of the Crown has been studiously minimized by Cecil himself and by his biographers. Years afterwards, he pretended that he had only signed the "devise" as a witness. There is no doubt that he saw which way the wind was blowing, and disliked Northumberland's scheme; but he had not the courage to resist the duke to his face. As soon, however, as the duke had set out to meet Mary, Cecil became the most active intriguer against him, and to these efforts, of which he laid a full account before Queen Mary, he mainly owed his immunity. He had, moreover, had no part in the divorce of Catherine or in the humiliation of Mary in Henry's reign, and he made no scruple about conforming to the religious reaction. It was rumoured in Dec. 1554 that Cecil would succeed Sir William Petre as secretary, an office which, with his chancellorship of the Garter, he had lost on Mary's accession. Probably the queen had more to do with the falsification of this rumour than Cecil, though he is said to have opposed in the parliament of 1555—in which he represented Lincolnshire—a bill for the confiscation of the estates of the Protestant refugees.

Cecil was in secret communication with Elizabeth before Mary died, and from the first the new queen relied on Cecil as she relied on no one else. Cecil was exactly the kind of minister England then required. A *via media* had to be found in Church and State, at home and abroad. Cecil was eminently a safe man, not an original thinker, but a counsellor of unrivalled wisdom. Caution was his supreme characteristic; he saw that above all things England required time. Like Fabius, he restored the fortunes of his country by deliberation. He averted open rupture until England was strong enough to stand the shock. There was nothing heroic about Cecil or his policy; it involved a callous attitude towards struggling Protestants abroad. But Cecil never developed that passionate aversion from decided measures which became a second nature to his mistress. His intervention in Scotland in 1550-60 showed that he could strike on occasion and his action over the execution of Mary, queen of Scots, proved that he was willing to take responsibility from which Elizabeth shrank. Generally he was in favour of more decided intervention on behalf of Continental Protestants than Elizabeth would admit. His share in the Anglican settlement of 1559 was considerable, and it coincided fairly with his own somewhat indeterminate

religious views. Like the mass of the nation, he grew more Protestant as time wore on; he was readier to persecute Papists than Puritans; he had no love for ecclesiastical jurisdiction, and he warmly remonstrated with Whitgift over his persecuting Articles of 1583. The finest encomium was passed on him by the queen herself when she said, "This judgment I have of you, that you will not be corrupted with any manner of gifts, and that you will be faithful to the State."

Of personal incident, apart from his mission to Scotland in 1560, there is little during the long reign of Elizabeth. He represented Lincolnshire in the parliament of 1559, and Northamptonshire in that of 1563, and he took an active part in the House of Commons until his elevation to the peerage; but there seems no good evidence for the story that he was proposed as speaker in 1563. In Feb. 1559 he was elected chancellor of Cambridge university in succession to Cardinal Pole. In 1571 he was raised to the peerage as Baron Burghley of Burghley (or Burleigh); the fact that he continued to act as secretary after his elevation illustrates the growing importance of that office, which under his son became a secretaryship of state. In 1572, however, the marquess of Winchester, who had been lord high treasurer under Edward, Mary and Elizabeth, died, and Burghley succeeded to his post. It was a signal triumph over Leicester; and, although Burghley had still to reckon with cabals in the council and at court, his hold over the queen strengthened with the lapse of years. Before he died, Robert, his only surviving son by his second wife, was ready to step into his shoes as the queen's principal adviser. Having survived all his rivals, and all his children except Robert and Thomas, Burghley died at his London house on Aug. 4, 1598, and was buried in St. Martin's, Stamford.

Burghley's private life was singularly virtuous; he was a faithful husband, a careful father and a considerate master. A book-lover and antiquary, he made a special hobby of heraldry and genealogy. It was the conscious and unconscious aim of the age to reconstruct a new landed aristocracy on the ruins of the old, and Burghley was a great builder and planter. All the arts of architecture and horticulture were lavished on Burghley House and Theobalds, which his son exchanged for Hatfield.

The most important collection of documents connected with Burghley is at Hatfield, where there are some ten thousand papers covering the period down to Burghley's death; these have been calendared in eight volumes by the Hist. mss. Comm. At least as many others are in the Record Office and British Museum, the Lansdowne mss. especially containing a vast mass of his correspondence; see the catalogues of Cotton, Harleian, Royal, Sloane, Egerton and Additional mss. in the British Museum, and the Calendars of Domestic, Foreign, Spanish, Venetian, Scottish and Irish State Papers.

Other official sources are the *Acts of the Privy Council* (vol. i.-xxix.); *Lords' and Commons' Journals*, *D'Ewes' Journals*; *Rymer's Foedera*; *Collins' Sydney Papers*; *Nichols' Progresses of Elizabeth*. Some valuable anonymous notes, probably by Burghley's servant Francis Alford, were printed in Peck's *Desiderata Curiosa* (1732), i. 1-66; other notes are in Naunton's *Fragmenta Regalia*. Lives by Collins (1732), Charlton and Melvil (1738), were followed by Nares's biography (3 vol., 1828-31); this provoked Macaulay's brilliant but misleading essay. M. A. S. Hume's *Great Lord Burghley* (1898) is largely a piecing together of the references to Burghley in the same author's *Calendar of Simancas mss.* The life by Dr. Jessopp (1904) is an expansion of his article in the *Dict. Nat. Biog.*

**BURGKMAIR, HANS or JOHN** (1473-c. 1531), German painter and engraver on wood, believed to have been a pupil of Albrecht Dürer, born at Augsburg. He certainly studied under his father, Thoman Burgkmair, and under Martin Schongauer. He was a member of the painters' guild in Strasbourg in 1490, and in Augsburg in 1498. Prof. Christ ascribes to him about 700 woodcuts, most of them distinguished by that spirit and freedom which we admire in the works of his supposed master. His principal work is the series of 135 prints representing the triumphs of the emperor Maximilian I. In his *Turnierbuch* of 52 illustrations he had the assistance of his son Hans Burgkmair (c. 1500-59). Burgkmair was also an excellent painter in fresco, specimens of which are in the galleries of Munich and Vienna.

See the edition (1854-56) of his *Turnierbuch* by J. van Hefner; Muther, "H. Burgkmair" in vol. xix. of *Zeitsch. für Bildende Kunst*.

**BURLARY**, at common law, the offence of breaking and entering the dwelling-house of another in the night-time with

intent to commit a felony. The offence and its punishment are regulated in England by the Larceny Act 1916. That statute by s. 25 provides that: "Every person who in the night (1) breaks and enters the dwelling-house of another with intent to commit any felony therein; or (2) breaks out of the dwelling-house of another, having (a) entered the said dwelling-house with intent to commit any felony therein; or (b) committed any felony in the said dwelling-house" is guilty of the felony called burglary and is liable to penal servitude for life. The four important points to be considered in connection with the offence of burglary are (1) the time, (2) the place, (3) the manner and (4) the intent. The time is the essence of the offence; night is defined by the act of 1916 to mean "the interval between nine o'clock in the evening and six o'clock in the morning of the next succeeding day."

The place must be a dwelling-house or private residence, i.e., the permanent building in which the occupier dwells. No building, although within the same curtilage as the dwelling-house and occupied therewith, is part of the dwelling-house for the purposes of burglary, unless there is a communication between such building and dwelling-house either immediate or by means of a covered and enclosed passage leading from the one to the other (s. 46 of the Act of 1916).

As to the manner, there must be both a breaking and an entry. Both must be at night, but not necessarily on the same night, provided that in the breaking and in the entry there is an intent to commit a felony. The breaking may be either an actual breaking of any external part of a building; or opening or lifting any closed door, window, shutter or lock; or entry by means of a threat, artifice or collusion with persons inside.

Breaking and entry must be with the intent to commit a felony, otherwise it is only trespass. The felony need not be a larceny; it may be either murder or rape.

*Housebreaking* in English law is to be distinguished from burglary, in that it is not essential that it should be committed at night, nor in a dwelling-house, save in the case of mere entry with intent to commit a felony. The offence and the punishment are now regulated by ss. 26 & 27 of the Larceny Act, 1916, and a distinction is made between housebreaking and committing felony, and housebreaking with intent to commit felony. Under s. 26: "Every person who (1) breaks and enters any dwelling-house, or any building within the curtilage thereof and occupied therewith, or any schoolhouse, shop, warehouse, counting-house, office, store, garage, pavilion, factory, or workshop, or any building belonging to His Majesty, or to any government department or to any municipal or other public authority, and commits any felony therein; or (2) breaks out of the same, having committed any felony therein" is guilty of felony and liable to penal servitude not exceeding 14 years. By s. 27: "Every person who, with intent to commit any felony therein, (1) enters any dwelling-house in the night; or (2) breaks and enters any dwelling-house, place of divine worship, or any building within the curtilage, or any school-house" or any of the other premises mentioned in s. 26 is guilty of felony and liable to penal servitude not exceeding seven years. Every burglary involves housebreaking, but every housebreaking does not amount to burglary.

In the United States state legislation has generally extended the common law offense of burglary. The breaking and entry of warehouses, shops, and similar premises is considered burglary in addition to the breaking and entry of dwelling-houses. Some statutes eliminate the necessity at common law for the offense being committed in the night-time, but such conduct is usually punishable as house-breaking rather than burglary. Many States have also made criminal the possession of burglarious tools with the intent to use them to commit burglary.

**BURLARY INSURANCE:** see INSURANCE: MISCELLANEOUS.

**BURGETON** or **BURGANET** (from Fr. *bourguignote*, Burgundian helmet), a form of light helmet or head-piece, which was in vogue in the 16th and 17th centuries. (See **HELMET**.)

**BURGOS**, a province of northern Spain which includes the enclave of Treviño in the province of Álava. Pop. (1920) 336,472; area 5,484 sq.m. The province extends from the main Cantabrian

watershed, beyond the Ebro, in the north, to south of the river Douro. In the east it marches with Logroño and Soria in the heart of the Demanda and Urbión massifs which separate Old Castile from the middle Ebro. From these massifs it descends westwards and southwards to the wide stretches of flat ground occupying the centre of the northern part of the central plateau. The Pancorbo gorge, cut across the Montes Obarenes in the north-east, gives a line of communication between the basin of Miranda de Ebro and the rest of the province, and at the same time between Álava and Old Castile. The Ebro runs eastwards through the northern half of the province, but is not navigable. The Douro, or Duero, crosses the southern half, running west-north-west; it also is unnavigable in its upper valley. The other important streams are the Pisuerga, flowing south towards Palencia and Valladolid, and the Arlanzón, which flows through Burgos for over 75m.

Burgos is one of the great forest provinces of Spain, with over 300,000ac. of pine, oak, beech and other species under State management (1924), while vast ranges of almost uninhabited upland serve as pasture for the flocks, which in most years exceed a million head of sheep. Lambs are exported to Bilbao and Madrid. Goats, horned cattle, horses, mules and swine are very numerous, but little interest is taken in the improvement of breeds. Cereal cultivation—wheat (1925) occupying 494,000ac., or two-fifths of the cultivated area—is the basis of the agriculture of this province, of which the centre and south form part of the cereal zone *par excellence* of Spain: equipment is, on the whole, primitive, but farmers' co-operative societies exist to provide agricultural credit and facilitate the purchase of implements and fertilizers; and an increased yield per acre, together with a fall in the wheat acreage since 1922, suggests improvement in methods and a check to the wasteful process of breaking up natural pasture for ploughland. The valleys of the Duero and Arlanzón produce good wine, and are agriculturally important for their more equable climate, their good communications, and their irrigation-works, actual and projected. Soft coal (used for briquettes), mica, china-clay and salt are obtained in small quantities, and oil-bearing lands north of the capital were under investigation (1925). The industries of the province are on a small scale, the ancient woollen, linen and hempen manufactures surviving in small factories and as cottage industries. Hydro-electric power and light are available; the main roads are good, and numerous motor services have superseded the mule and horse-drawn coaches (1926). The Northern railways from Madrid to the French frontier cross the province in the central districts: the Valladolid-Bilbao line in the north; and the Valladolid-Saragossa line in the south. The Ontaneda-Burgos-Soria-Calatayud railway, commenced in 1925, will establish direct communication between the Cantabrian sea at Santander and the Mediterranean at Valencia. The only important town in the province is Burgos (32,301). The country towns and villages are inhabited by a notably intelligent and independent peasantry—petty farmers, shepherds and foresters—whose physical type is northern rather than Mediterranean; and Burgos stands fourth or fifth in Spain in respect of elementary education, above the rich provinces of Biscay and Barcelona. But the extreme subdivision of the peasants' holdings forces numbers of men to migrate to the Basque provinces, Barcelona and the Argentine republic, and consequently population has declined since the beginning of this century, despite the excess of births over deaths.

See M. Anibarro and M. Rives, *Intento de un diccionario biográfico y bibliográfico de autores de la provincia de Burgos* (Madrid, 1890); *Burgos y su provincia*, anon. (Vitoria, 1898).

**BURGOS**, the capital formerly of Old Castile, and since 1833 of the Spanish province of Burgos. Pop. (1920) 32,301. Burgos occupies a site of great strategic importance, commanding both the natural route from the Ebro to the plateau of Old Castile by the Pancorbo defile, now followed by the main road and railway line from France, and also the road from Pamplona, formerly part of the Pilgrims' Way leading to Santiago, which runs closer to the foothills of the Sierra de la Demanda (25m. east). Its site on the lower slopes of a castle-crowned hill, overlooking narrows

of the river Arlanzón, is also one of tactical strength. Side valleys which enter the main valley here, from the north with the road from Bivar, the home of the Cid Campeador, and from the south, with the main road from Madrid, contribute further to the importance of Burgos as a nodal point.

The oldest quarter of the town, with the older churches, stands on the eastern slope of the Castle Hill; a broad alley, cobbled and terraced, descends steeply to the cathedral, which presses

THE WHITE LIMESTONE CATHEDRAL OF BURGOS. FOUNDED IN A.D. 1221 The erection of this cathedral was not completed till 1567. It is an excellent example of florid gothic. Its original cruciform design is obscured by its 15 additional chapels

closely to the hillside at the foot, its great mass dominating the entire town. Eastwards along the flat ground extends the rest of the old town, whose life centres in the arcaded Plaza Mayor, the Plaza de Prim, a busy market-place, and the Plaza de la Libertad, with the late 15th century Casa del Cordón. Beyond these, along the road to France, and on the eastern outskirts, are the military headquarters, barracks, parade and exercise grounds. Across the river, and separated from the old town by long lines of avenues fringing the two banks, a new suburb, with the railway station and some modern factories, has been built on no very regular plan, round an older manufacturing quarter, and absorbing a number of convents and ex-convents and the Casa de Miranda, the last a building representative of the best domestic architecture of 16th century Spain. Six bridges connect the two sides of the river, the most important, the Puente de Santa María, leading to the Arco de Santa María, the finest of the four gates left to the old town. This gate, with its sculptures illustrating the history of Burgos, was built to commemorate the return of the citizens to their allegiance to the emperor Charles V. after the suppression in 1522 of the rising of the *comuneros*.

Burgos is the see of an archbishop, whose province comprises the dioceses of León, Palencia, Osma, Calahorra and Santo Domingo, Vitoria and Santander. The cathedral, founded in 1221 by Ferdinand III. of Castile and the English bishop Maurice of Burgos, is a fine example of florid Gothic, built of white limestone. It was not completed until 1567, and the architects principally responsible for its construction were a Frenchman in the 13th century and a German in the 15th. Its cruciform design is almost hidden by the 15 chapels added at all angles to the aisles and transepts, by the beautiful 14th-century cloister on the north-west and the archiepiscopal palace on the south-west. Over the three central doorways of the main or western façade rise two lofty and graceful towers. Many of the monuments within the cathedral are of considerable artistic and historical interest. The chapel of Corpus Christi contains the chest which the Cid is said to have filled with sand and subsequently pawned for a large sum to the credulous Jews of Burgos. The legend adds that he redeemed his pledge. In the aisleless Gothic church of Santa Agueda, or Santa Gadéa, tradition relates that the Cid compelled Alphonso VI. of León, before his accession to the throne of Castile in 1072, to swear that he was innocent of the murder of Sancho, his brother and predecessor on the throne. San Esteban, completed between 1280 and 1350, and San Nicolás, dating from 1505, are small Gothic churches, each with a fine sculptured doorway. Many of the convents of Burgos have been destroyed, and those which survive lie chiefly outside the city. At the end of the Paseo de la Isla stands the nunnery of Santa María la Real de las Huelgas, originally a summer palace (*huelga*, "pleasure-ground") of the

kings of Castile. In 1187 it was transformed into a Cistercian convent by Alphonso VIII., who invested the abbess with almost royal prerogatives, including the power of life and death, and absolute rule over more than 50 villages. Alphonso and his wife Eleanor, daughter of Henry II. of England, are buried here. The Cartuja de Miraflores, a Carthusian convent, founded by John II. of Castile (1406-54), lies 2m. south-east of Burgos. Its church contains a monument of exceptional beauty, carved by Gil de Siloë in the 15th century, for the tomb of John and his second wife, Isabella of Portugal. The convent of San Pedro de Cardena, 7m. south-east of Burgos, was the original burial-place of the Cid, in 1099, and of Ximena, in 1104. About 50m. from the city is the abbey of Silos, which appears to have been founded under the Visigothic kings, as early as the 6th century. It was restored in 919 by Fernán González, and in the 11th century became celebrated throughout Europe, under the rule of St. Dominic or Domingo. It was reoccupied in 1880 by French Benedictine monks.

After its foundation in 884 as an outpost in the east of the Asturian kingdom, Burgos became rapidly the capital of the countship, and, later, the kingdom of Castile declared independent in 1035. The traditions of its earliest period are preserved in the statues, occupying niches on the face of the Arco de Santa Maria (vide supra), representing the founder Porcellos, the two first popularly elected "Judges of Castile," the 10th century hero Fernán González and the 11th century hero, the Cid Campeador, whose bones (since 1919) rest in the cathedral. The rival at first of León, and later—the final absorption of the Leonese kingdom by Castile—of Toledo and Valladolid, Burgos, as the recognized "head of Castile," enjoyed the prestige of a capital city until the reign of Philip II. Like its rivals it sank to political insignificance after 1560, when Madrid was declared the *única corte*. There remained, however, to Burgos the commercial supremacy in Castile which resulted from the powers with which its merchant guild was invested by the Catholic sovereigns in 1494. By a decree of that year the whole foreign trade of Castile, particularly the valuable trade in fine wool, and the loading and allocation of the ships belonging to the fleets sailing from the ports of the north coast were put under the administration and jurisdiction of the prior and consulado of the Burgos guild; the shipping department of this organization became the model for the more famous Casa de Contratación at Seville. With the decline of Castilian trade, Burgos languished until its revival in the 18th century under Charles III. To-day it is an agricultural centre, with manufactures of heavy woollen and leathern goods, chemical manures, chocolate and paper.

A general description of the city and its monuments is given by A. Llacayo y Santa Maria in *Burgos, etc.* (Burgos, 1889). See also *Architectural, Sculptural and Picturesque Studies in Burgos and its Neighbourhood*, a valuable series of architectural drawings in folio, by J. B. Waring (London, 1852). The following are monographs on particular buildings:—*Historia de la Catedral de Burgos, etc.*, by P. Orcajo (Burgos, 1856); *El Castillo de Burgos*, by E. de Oliver-Copons (Barcelona, 1893); *La Real Cartuja de Miraflores*, by F. Tarín y Juaneda (Burgos, 1896); Luis de Pablo Ibáñez, *Catedral de Burgos* (Burgos, 1921). For the history of the city see *En Burgos*, by V. Balaguér (Burgos, 1895); Eloy García de Quevedo y Concellón, *Ordenanzas del Consulado de Burgos de 1538* (Burgos, 1905); O. Jürgens, *Spanische Städte* (Hamburg, 1926). For the history of Silos see M. Férotin, *Histoire de l'Abbaye de Silos* (Paris, 1897).

**BURGOYNE, JOHN** (1722-1792), English general and dramatist, entered the army at an early age. In 1743 he made a runaway marriage with a daughter of the earl of Derby, but soon had to sell his commission to meet his debts, after which he lived abroad for seven years. By Lord Derby's interest Burgoyne was then reinstated at the outbreak of the Seven Years' War. He sat in parliament for Midhurst (1761), and for Preston (1768). At the same time he devoted much attention to art and drama (his first play, *The Maid of the Oaks*, being produced by Garrick in 1775), and gambled recklessly. In the army he had by this time become a major-general, and in 1777 he was at the head of the British reinforcements designed for the invasion of the American colonies from Canada. He gained possession of Ticonderoga (for which he was made a lieutenant-general) and Fort Edward. He pushed on, intending to effect a junction with Sir William Howe,

who should have been advancing to meet him from New York. But owing to a delay in receiving his instructions Howe was not there. Skilful American operations had cut his communications with Canada and Burgoyne yielded to a superior force at Saratoga (Oct. 17). English indignation at his severe defeat was great; on May 26, 1778 Burgoyne, whom the Americans had permitted to return, unsuccessfully defended himself in parliament against attacks from nearly every party in the House: the Government denouncing him for his failure, Wilkes and his supporters for his allegedly brutal use of savage Indian troops. The immediate followers of Fox alone supported him at the time, but it is now generally admitted that the responsibility for the defeat at Saratoga did not lie with Burgoyne. He was deprived of his offices except that of general, and after temporary rehabilitation by Rockingham in 1782 he withdrew more and more into private life, his last public service being his participation in the impeachment of Warren Hastings. His comedy, *The Heiress*, which appeared in 1786, ran through ten editions within a year, and was translated into several foreign languages. He died suddenly on June 4, 1792. General Burgoyne, whose wife died in June 1776 during his absence in Canada, had several natural children (born between 1782 and 1788) by Susan Caulfield, an opera singer, one of whom became Field Marshal Sir J. F. Burgoyne. His *Dramatic and Poetical Works* appeared in two vols., 1808.

See E. B. de Fonblanque, *Political and Military Episodes from the Life and Correspondence of Right Hon. J. Burgoyne* (1876); W. L. Stone, *Campaign of Lieut.-Gen. J. Burgoyne, etc.* (Albany, N.Y., 1877); Philip Guedala, *Fathers of the Revolution* (1926); S. F. Batchelder, *Burgoyne and His Officers in Cambridge, 1777-1778* (Cambridge, Mass., 1926); and F. J. Hudleston, *Gentleman Johnny Burgoyne* (Indianapolis, 1927).

**BURGOYNE, SIR JOHN FOX**, Bart. (1782-1871), British field-marshal, was an illegitimate son of General John Burgoyne (q.v.). He was educated at Eton and Woolwich, obtained his commission in 1798, and served in 1800 in the Mediterranean. He took part in the Egyptian expedition of 1807, and was with Sir John Moore in Sweden in 1808 and in Portugal in 1808-9. In the Corunna campaign Burgoyne held the very responsible position of chief of engineers with the rear guard of the British army (see PENINSULAR WAR). He served with great distinction throughout the Peninsular War, and after the battle of Vittoria, in 1813, he became commanding engineer on Lord Wellington's staff. At the end of the war he received the C.B. In the campaign of 1814-15 he served at New Orleans and Mobile. Burgoyne was largely employed, during the long peace which followed Waterloo, in other public duties as well as military work. In 1851 he was promoted lieutenant-general, and in the following year received the G.C.B. When the Crimean War broke out he accompanied Lord Raglan's headquarters to the East, superintended the disembarkation at Old Fort, and was in effect the principal engineer adviser to the English commander during the first part of the siege of Sevastopol. In 1868 on resigning his post as inspector-general of fortifications, which he had held for over 20 years, he was made a field-marshal; Parliament granted him, at the same time, a pension of £1,500. He died Oct. 7, 1871, a year after the tragic death of his only son, Captain Hugh Talbot Burgoyne, V.C. (1833-1870), who was in command of H.M.S. "Captain" when that vessel went down in the Bay of Biscay (Sept. 7, 1870).

See *Life and Correspondence of F.M. Sir John Burgoyne* (edited by Lt.-Col. Hon. G. Wrottesley, R.E. 1873); Sir Francis Head, *A Sketch of the Life and Death of F.M. Sir John Burgoyne* (1872); *Military Opinions of General Sir John Burgoyne* (ed. Wrottesley, 1859), a collection of the most important of Burgoyne's contributions to military literature.

**BURGRAVE**, the Eng. form, derived through French, of the Ger. *Burggraf* and Flem. *burg* or *burgh-graue*, i.e., count of a castle or fortified town. The title corresponds generally to that of castellan or *châtelain* (q.v.).

**BURGSTÄDT**, a town in the south of the district of Leipzig in the republic of Saxony, 8m. N.W. of Chemnitz. Pop. (1925) 8,829. Manufactures include gloves, hosiery, knitted goods, cardboard and embroidery.

**BURGUNDIO**, sometimes erroneously styled **BURGUNDIUS**, an Italian jurist of the 12th century. He was a professor at the

University of Paris, and assisted at the Lateran Council in 1179, dying at a very advanced age in 1194. He was a distinguished Greek scholar, and is believed on the authority of Odofredus to have translated into Latin, soon after the Pandects were brought to Bologna, the various Greek fragments which occur in them, with the exception of those in the 27th book, the translation of which has been attributed to Modestinus. The Latin translations ascribed to Burgundio were received at Bologna as an integral part of the text of the Pandects, and form part of that known as *The Vulgate* in distinction from the Florentine text.

**BURGUNDY.** The name of Burgundy has denoted very diverse political and geographical areas at different periods of history and as used by different writers. The name is derived from the Burgundians, a people of Germanic origin, who at first settled between the Oder and the Vistula. In consequence of wars against the Alamanni, in which the latter had the advantage, the Burgundians, after having taken part in the great invasion of Radagaisus in 407, were obliged in 411 to take refuge in Gaul, under the leadership of their chief Gundicar. As allies of the Romans, they established themselves in certain cantons of the Sequani and of upper Germany, receiving a part of the lands, houses and serfs that belonged to the inhabitants. Thus was founded the first kingdom of Burgundy, the boundaries of which were widened at different times by Gundicar and his son Gunderic; its chief towns being Vienne, Lyons, Besançon, Geneva, Autun and Mâcon. Gundibald (d. 516), grandson of Gunderic, is famous for his codification of the Burgundian law, known consequently as *Lex Gundobada*, in French *Loi Gombette*. His son Sigismund, who was canonized by the Church, founded the abbey of St. Maurice at Agaunum. But, incited thereto by Clotilda, the daughter of Chilperic (a brother of Gundibald, and assassinated by him), the Merovingian kings attacked Burgundy. An attempt made in 524 by Clodomer was unsuccessful; but in 534 Clotaire (Chlothachar) and his brothers possessed themselves of the lands of Gundimar, brother and successor of Sigismund, and divided them between them. In 561 the kingdom of Burgundy was reconstructed by Guntram, son of Clotaire I., and until 613 it formed a separate State under the government of a prince of the Merovingian family.

After 613 Burgundy was one of the provinces of the Frankish kingdom, but in the redistributions that followed the reign of Charlemagne the various parts of the ancient kingdom had different fortunes. In 843, by the treaty of Verdun, Autun, Chalon, Mâcon, Langres, etc., were apportioned to Charles the Bald, and Lyons with the country beyond the Saône to Lothair I. On the death of the latter the duchy of Lyons (Lyonnais and Viennois) was given to Charles of Provence, and the diocese of Besançon with the country beyond the Jura to Lothair, king of Lorraine. In 879 Boso founded the kingdom of Provence, wrongly called the kingdom of Cisjuran Burgundy, which extended to Lyons, and for a short time as far as Mâcon (*see* PROVENCE).

In 888 the kingdom of Jurane Burgundy was founded by Rudolph I., son of Conrad, count of Auxerre, and the German king Arnulf could not succeed in expelling the usurper, whose authority was recognized in the diocese of Besançon, Basle, Lausanne, Geneva and Sion. For a short time his son and successor Rudolph II. (912-37) disputed the crown of Italy with Hugh of Provence, but finally abandoned his claims in exchange for the ancient kingdom of Provence, *i.e.*, the country bounded by the Rhône, the Alps and the Mediterranean. His successor, Conrad the Peaceful (937-93), whose sister Adelaide married Otto the Great, was hardly more than a vassal of the German kings. The last king of Burgundy, Rudolph III. (993-1032), being deprived of all but a shadow of power by the development of the secular and ecclesiastical aristocracy (especially by that of the powerful feudal houses of the counts of Burgundy [*see* FRANCHE-COMTÉ], SAVOY and PROVENCE) died without issue, bequeathing his lands to the emperor Conrad II. Such was the origin of the imperial rights over the kingdom designated after the 13th century as the kingdom of Arles (*q.v.*).

The name of Burgundy now gradually became restricted to the countship of that name, which excluded the district between the Jura and the Saône, in later times called Franche-Comté, and to

the *duchy* which had been created by the Carolingian kings in the portion of Burgundy that had remained French, with the object of resisting Boso. This duchy had been granted to Boso's brother, Richard the Justiciary, count of Autun. It comprised at first the countships of Autun, Mâcon, Chalon-sur-Saône, Langres, Nevers, Auxerre and Sens, but its boundaries and designations changed many times in the course of the 10th century. Duke Henry died in 1002; and in 1015, after a war which lasted 13 years, the French king Robert II. reunited the duchy to his kingdom, despite the opposition of Otto William, count of Burgundy, and gave it to his son Henry, afterwards King Henry I. As king of France, the latter in 1032 bestowed the duchy upon his brother Robert, from whom sprang that first ducal house of Burgundy, which flourished until 1361. A grandson of this Robert, who went to Spain to fight the Arabs, became the founder of the kingdom of Portugal; but in general the first Capet dukes of Burgundy were pacific princes who took little part in the political events of their time, or in that religious movement which was so marked in Burgundy, at Cluny to begin with, afterwards among the disciples of William of St. Bénigne of Dijon, and later still among the monks of Cîteaux. In the 12th and 13th centuries we may mention Duke Hugh III. (1162-93), who played an active part in the wars that marked the beginning of Philip Augustus's reign; Odo (Eudes) III. (1193-1218), one of Philip Augustus's principal supporters in his struggle with King John of England; Hugh IV. (1218-72), who acquired the countships of Chalon and Auxonne; Robert II. (1272-1309), one of whose daughters, Margaret, married Louis X. of France, and another, Jeanne, Philip of Valois; Odo (Eudes) IV. (1315-50) who gained the countship of Artois in right of his wife, Jeanne of France, daughter of Philip V. the Tall and of Jeanne, countess of Burgundy.

In 1361, on the death of Duke Philip de Rouvres, son of Jeanne of Auvergne and Boulogne, who had married the second time John II. of France, surnamed the Good, the duchy of Burgundy returned to the crown of France. In 1363 John gave it, with hereditary rights, to his son Philip, surnamed the Bold, thus founding that second Capet house of Burgundy which filled such an important place in the history of France during the 14th and 15th centuries, acquiring as it did a territorial power which proved formidable to the kingship itself. By his marriage with Margaret of Flanders Philip added to his duchy, on the death of his father-in-law, Louis of Male, in 1384, the countships of Burgundy and Flanders; and in the same year he purchased the countship of Charolais from John, count of Armagnac. On the death of Charles V. in 1380 Philip and his brothers, the dukes of Anjou and Berry, had possessed themselves of the regency, and it was he who led Charles VI. against the rebellious Flemings, over whom the young king gained the victory of Roosebeke in 1382. Momentarily deprived of power during the period of the "Marmousets" government, he devoted himself to the administration of his own dominions, establishing in 1386 an audit-office (*chambre des comptes*) at Dijon and another at Lille. In 1396 he refused to take part personally in the expedition against the Turks which ended in the disaster of Nicopolis, and would only send his son John, then count of Nevers. In 1392 the king's madness caused Philip's recall to power along with the other princes of the blood, and from this time dates that hostility between the party of Burgundy and the party of Orleans which became so intense when in May 1404 Duke Philip had been succeeded by his son, John the Fearless.

The victory of Hasbain which John achieved on Sept. 23, 1403 over the Liégeois, who had attacked his brother-in-law, John of Bavaria, bishop of Liège, still further strengthened his power and reputation, and during the following years the struggle between the Burgundians and the partisans of the duke of Orleans went on with varying results. In 1419, just when he was thinking of making advances towards the party of the dauphin (Charles VII.), he was assassinated by members of that party. This event inclined the new duke of Burgundy, Philip the Good, towards an alliance with England. In 1420 he signed the treaty of Troyes, which recognized Henry V. as the legitimate successor of Charles VI.; in 1423 he gave his sister Anne in marriage to John, duke of

Bedford; and during the following years the Burgundian troops supported the English pretender. But a dispute between him and the English concerning the succession in Hainaut, their refusal to permit the town of Orleans to place itself under his rule, and the defeats sustained by them, all combined to embroil him with his allies, and in 1435 he concluded the treaty of Arras with Charles VII. The king relieved the duke of all homage for his estates during his lifetime and gave up to him the countships of Mâcon, Auxerre, Bar-sur-Seine and Ponthieu; and, reserving the right of redemption, the towns of the Somme (Roye, Montdidier, Péronne, etc.). Besides this, Philip had acquired Brabant and Holland in 1433 as the inheritance of his mother. He gave an asylum to the dauphin Louis when exiled from Charles VII.'s court, but refused to assist him against his father, and henceforth rarely intervened in French affairs. He busied himself particularly with the administration of his State, founding the university of Dôle, having records made of Burgundian customs, and seeking to develop the commerce and industries of Flanders. A friend to letters and the arts, he was the protector of writers like Olivier de la Marche, and of sculptors of the school of Dijon. He also desired to revive ancient chivalry as he conceived it, and in 1429 founded the order of the Golden Fleece; while during the last years of his life he devoted himself to the preparation of a crusade against the Turks. Neither these plans, however, nor his liberality, prevented his leaving a well-filled treasury and enlarged dominions, when he died in 1467.

Philip's successor was his son by his third wife, Isabel of Portugal, Charles, surnamed the Bold, count of Charolais, born in 1433. To him his father had practically abandoned his authority during his last years. Charles had taken an active part in the so-called wars "for the public weal," and in the coalitions of nobles against the king which were so frequent during the first years of Louis XI.'s reign. His struggle against the king is especially marked by the interview at Péronne in 1468, when the king had to confirm the duke in his possession of the towns of the Somme, and by a fruitless attempt which Charles the Bold made on Beauvais in 1472. Charles sought above all to realize a scheme already planned by his father. This was to annex territory which would reunite Burgundy with the northern group of her possessions (Flanders, Brabant, etc.) and to obtain the emperor's recognition of the kingdom of "Belgian Gaul." In 1469 he bought the landgraviate of Alsace and the countship of Ferrette from the archduke Sigismund of Austria, and in 1473 the aged duke Arnold ceded the duchy of Gelderland to him. In the same year he had an interview at Trier with the emperor Frederick III., when he offered to give his daughter and heiress, Mary of Burgundy, in marriage to the emperor's son Maximilian in exchange for the concession of the royal title. But the emperor, uneasy at the ambition of the "grand-duke of the West," did not pursue the negotiations.

Meanwhile the tyranny of the duke's lieutenant Peter von Hagenbach, who was established at Ferrette as governor (*grand bailli* or *Landvogt*) of Upper Alsace, had brought about an insurrection. The Swiss supported the cause of their allies, the inhabitants of the free towns of Alsace, and Duke René II. of Lorraine also declared war against Charles. In 1474 the Swiss invaded Franche-Comté and achieved the victory of Héricourt. In 1475 Charles succeeded in conquering Lorraine, but an expedition against the Swiss ended in the defeat of Grandson (Feb. 1476). In the same year the duke was again beaten at Morat, and the Burgundian nobles had to abandon to the victors a considerable amount of booty. Finally the duke of Lorraine returned to his dominions; Charles advanced against him, but on Jan. 6, 1477 he was defeated and killed before Nancy.

By his wife, Isabella of Bourbon, he only left a daughter, Mary, and Louis XI. claimed possession of her inheritance as guardian to the young princess. He succeeded in getting himself acknowledged in the duchy and countship of Burgundy, which were occupied by French garrisons. But Mary, alarmed by this annexation, and by the insurrection at Ghent (secretly fomented by Louis), decided to marry the archduke Maximilian of Austria, to whom she had already been promised (Aug. 1477), and hostilities soon broke out between the two princes. Mary died through a

fall from her horse in March 1482, and in the same year the treaty of Arras confirmed Louis XI. in possession of the duchy. Franche-Comté and Artois were to form the dowry of the little Margaret of Burgundy, daughter of Mary and Maximilian, who was promised in marriage to the dauphin. As to the lands proceeding from the succession of Charles the Bold, which had returned to the Empire (Brabant, Hainaut, Limburg, Namur, Gelderland, etc.), they constituted the "Circle of Burgundy" from 1512 onward.

We know that the title of duke of Burgundy was revived in 1682 for a short time by Louis XIV. in favour of his grandson Louis, the pupil of Fénelon. But from the 16th to the 18th century Burgundy constituted a military government bounded on the north by Champagne, on the south by Lyonnais, on the east by Franche-Comté, on the west by Bourbonnais and Nivernais. It comprised Dijonnais, Autunois, Auxois, and the *pays de la montagne* or Country of the Mountain (Châtillon-sur-Seine), with the "counties" of Chalonais, Mâconnais, Auxerrois and Bar-sur-Seine, and, so far as administration went, the annexes of Breese, Bugey, Valromey and the country of Gex. Burgundy was a *pays d'États*. The estates, whose privileges the dukes at first and later Louis XI., had to swear to maintain, had their assembly at Dijon, usually under the presidency of the governor of the province, the bishop of Autun as representing the clergy, and the mayor of Dijon representing the third estate. From the judiciary point of view the greater part of Burgundy depended on the parlement of Dijon; but Auxerrois and Mâconnais were amenable to the parlement of Paris.

Jahn, *Geschichte der Burgundionen* (1874); E. Petit de Vausse, *Histoire des ducs de Bourgogne de la race capétienne* (1885-1905); B. de Barante, *Histoire des ducs de Bourgogne de la maison de Valois* (1833-36); the marquis Léon E. S. J. de Laborde, *Les Ducs de Bourgogne: Études sur les lettres, les arts et l'industrie pendant le XV<sup>e</sup> siècle* (1849-51). (R. P.)

**BURGUNDY WINES.** Burgundy is the name given to the red and white wines made within the limits of the "départements" of the *Côte d'Or*, the *Saône et Loire* and the *Yonne*, which were previous to 1789 within the province of Burgundy, in France.

The name *Burgundy* is not a generic term but a geographical appellation: Burgundy wine is not a type of wine that can be matched anywhere; it is, or should be, the name of no other wine but that which is made from grapes grown on Burgundian hills.

There are many varieties of both red and white Burgundies, but the best of all come from some hills, known as the *Côte d'Or*, which have given their name to the "département" of which Dijon is the chief city. The hills of the *Côte d'Or* stretch for about 36 miles in a south-south-east direction from Dijon to Chalon-sur-Saône, and are divided in two parts: the first, from Dijon to Corton, are known as the *Côte de Nuits*, and the second, from Corton to Santenay, as the *Côte de Beaune*.

The finest of all red Burgundies are those made from the vineyards of the *Côte de Nuits*, the best of which, as one proceeds from north to south, are the following:—Chambertin, Clos de Bèze, Clos de Tart, Musigny, Clos de Vougeot, Grands Échézeaux, Romanée Conti, Richebourg, Nuits St. Georges.

Proceeding further south, the best vineyards of the *Côte de Beaune* are those in the communes or parishes of:—Aloxe Corton, Pernand, Beaune, Pommard, Volnay, Chassagne, Santenay.

As regards white wines, the finest come from the vineyards of Montrachet, and the next best from the vineyards of Meursault.

Further south, the hills of the *Côte Chalonnaise*, of the *Côte Maconnaise*, and of the *Beaujolais* produce very large quantities of both red and white wines, mostly red, which are quite distinctive, pleasant and wholesome, but none of these compare either in quality or price with the best wines of the *Côte d'Or*.

**The Wine of Chablis.**—In an entirely different direction, further north, in the département of the *Yonne*, one of the most popular white wines in the world is made from the vineyards of *Chablis*. Geographically, Chablis is entitled to be included among the wines of Burgundy, but it is of a very different type from the white wines of the *Côte d'Or*.

Few wines have suffered to the same extent as Chablis from that most objectionable form of flattery which is called imitation. The vineyards of Chablis are divided into three classes, and the best of the three yields but a small quantity of fine white wine. Some of the best vineyards of Chablis are those of *La Moutonne*, *Le Clos* and *Vaudésir*.

The colour of Chablis is of the palest possible amber, with a greenish tinge reminiscent of some of the early Australian gold; its taste has something fresh and crisp about it which is quite distinctive and exceedingly attractive. Genuine Chablis is never cheap because there is but little of it; faked Chablis is always dear, and yet there is a lot of it. (A. L. S.)

Mathieu, *Caractères et classification des vins de Bourgogne* (Dijon, 1911).

**BURHANPUR**, a town of British India on the G.I.P. railway, in the Nimar district of the Central Provinces, situated on the north bank of the river Tapti, 310 m. N.E. of Bombay. It was founded in A.D. 1400 by a Mohammedan prince of the Farukhi dynasty of Khandesh. His successors held it for 200 years, after which it was annexed to the empire of Akbar. It formed the chief seat of the Government of the Deccan Provinces of the Mogul empire till Shah Jahan removed the capital to Aurangabad in 1635. Burhanpur was plundered in 1685 by the Mahrattas, and became for 100 years the centre of many conflicts between the Mahrattas and Moguls. In 1803 it was captured by General Wellesley, afterwards duke of Wellington, but restored by treaty to Sindhia, by whom it was finally ceded to the British in 1861. In its fort, old palace, mosques and tombs, it resembles the old Mogul capitals of the north, and is referred to in the *Ain-i-Akbari*, by Sir Thomas Roe, and Tavernier, as a city with very flourishing industries and trades. Like all Mogul cities, it was famous for luxury articles—brocades, flowered silks, gold and silver embroideries. It is now an ancient walled city which, after many years of decay from its old-time status, and the decline almost to vanishing point of the old industries, is showing an upward tendency under more modern conditions. There are a few old families who still produce gold and silver thread and brocades, and it still has a large body of weavers of silk bordered cloths, while the establishment of cotton mills, ginning factories and presses has restored some of its lost wealth.

Its population, after many intercensal fluctuations, has now risen to 35,916, comprising the largest proportion of Mohammedans to be found in any town in the Central Provinces. Its old Mogul water supply has been modernized, and the insanitary conditions considerably improved.

**BURI** or **BURE**, in Norse mythology, was born from the rocks, licked by the cow Andhumla (darkness). He was the father of Bor, who became the father of Odin.

**BURIAL**, depositing (a body) in the earth. Every one in England, whether a parishioner or not, has the right to be buried in the burial ground of the parish where he dies, except executed felons, who must be buried in the prison or in a place appointed by the Home Office. At common law the person under whose roof a death takes place has a duty to provide for the body being carried to the grave decently covered; and the executors or legal representatives of the deceased are bound to bury or dispose of the body in a manner becoming the estate of the deceased, according to their discretion, and they are not bound to fulfil the wishes he may have expressed in this respect. The disposal must be such as will not expose the body to violation, or offend the feelings or endanger the health of the living; and cremation under proper restrictions is allowable. In the case of paupers dying in a workhouse, or shipwrecked persons whose bodies are cast ashore, the overseers or guardians are responsible for their burial. In the case of persons found *felo de se*, the coroner must give directions for the burial of the remains in the churchyard or burial ground of the parish in which the remains might be interred had a verdict of *felo de se* not been found.

The expenses of burial are payable out of the deceased's estate in priority to all other debts. A husband is liable for the funeral expenses of his wife, even though she has been living separate from him, and though she was buried without his knowledge or request. A parent is liable for the funeral expenses of his children, if he has the means of paying. Legislation has principally affected (1) places of burial, (2) mode of burial, (3) fees for burial and (4) disinterment.

1. The overcrowded state of churchyards and burial grounds led to the passing of a group of statutes known as the Burial Acts, extending from 1852 up to 1900. By these acts a general system was set up, the aim of which was to remedy the existing deficiencies of accommodation by providing new burial grounds and closing old ones which should be dangerous to health, and to establish a central authority (now for most purposes the Ministry of Health) to superintend all burial grounds with a view to the protection of the public health and the maintenance of public decency in burials. The Ministry of Health thus has the power to obtain by order in council the closing of any burial ground it thinks fit, while its consent is necessary to the opening of any new burial ground; and it also has power to direct inspection of any burial ground or cemetery, and to regulate burials in common graves in statutory cemeteries and to compel persons in charge of vaults or places of burial to take steps necessary for preventing their becoming dangerous or injurious to health. The vestry of any parish was thus authorized to provide itself with a new burial ground, if its existing one was no longer available; such ground might be wholly or partly consecrated, and chapels might be provided for the performance of burial service. The ground was put under the management of a burial board, consisting of ratepayers elected by the vestry, and the consecrated portion of it took the place of the churchyard in all respects. Disused churchyards and burial grounds in London may be used as open spaces for recreation, and only buildings for religious purposes can be built on them (1881, 1884, 1887). The Local Government Act 1894 introduced a change into the government of burial grounds (consequent on the general change made in parochial government) by transferring, or allowing to be transferred, the powers, duties, property and liabilities of the burial boards in urban districts to the district councils, and in rural parishes to the parish councils and parish meetings; and by allowing rural parishes to adopt the Burial Acts, and provide and manage new burial grounds by the parish council, or a burial board elected by the parish meeting.

2. The mode of burial is a matter of ecclesiastical cognizance; in the case of churchyards and elsewhere it is in the discretion of the owners of the burial ground. The Ministry of Health now makes the regulations for burials in burial grounds provided under the Burial Acts; for cemeteries provided under the Public Health Act 1879. Private cemeteries and burial grounds make their own regulations. Before 1880 no body could be buried in consecrated ground except with the service of the church, which the incumbent of the parish or a person authorized by him was bound to perform; but the canons and prayer-book refused the use of the office for excommunicated or unbaptized persons, and persons against whom a verdict of *felo de se* had been found. But by the Burial Laws Amendment Act 1880, the bodies of persons entitled to be buried in parochial burial grounds, whether churchyards or graveyards, may be buried there, on proper notice being given to the minister, without the performance of the service of the Church of England, and either without any religious service or with a Christian and orderly religious service at the grave, which may be conducted by any person invited to do so by the person in charge of the funeral. Clergymen of the Church of England are also by the act allowed, but are not obliged, to use the burial service in any unconsecrated burial ground or cemetery, or building thereon, in any case in which it could be used in consecrated ground. In cases where it may not be so used, and where such is the wish of those in charge of the service, the clergy may use a form of service approved by the bishop without being liable to any ecclesiastical or temporal penalty. The proper performance of the burial office is provided for by the Public Worship

Regulation Act 1874. Statutory provision is made by the criminal law in this act for the preservation of order in burial grounds and protection of funeral services.

3. Fees are now payable by custom or under statutory powers on all burials. In a churchyard the parson must perform the office of burial for parishioners, even if the customary fee is denied, and it is doubtful who is liable to pay it. The custom must be immemorial and invariable. If not disputed, its payment can be enforced in the ecclesiastical court; if disputed, its validity must be tried by a temporal court. A special contract for the payment of an annual fee in the case of a non-parishioner can be enforced in the latter court. In the case of paupers and shipwrecked persons the fees are payable by the parish. In other parochial burial grounds and cemeteries the duties and rights to fees of the incumbents, clerks and sextons of the parishes for which the ground has been provided are the same as in burials in the churchyard. Burial authorities may fix the fees payable in such grounds, subject to the approval of the Home Secretary; but the fees for services rendered by ministers of religion and sextons must be the same in the consecrated as in the unconsecrated part of the burial ground, and no incumbent of a parish or a clerk may receive any fee upon burials except for services rendered by them (Act of 1900). On burials under the act of 1880 the same fees are payable as if the burial had taken place with the service of the church.

4. A corpse is not the subject of property, nor capable of holding property. If interred in consecrated ground, it is under the protection of the ecclesiastical court; if in unconsecrated, it is under that of the temporal court. In the former case it is an ecclesiastical offence, and in either case it is a misdemeanour, to disinter or remove it without proper authority, whatever the motive for such an act may be. Such proper authority is (1) a faculty from the ordinary, where it is to be removed from one consecrated place of burial to another, and this is often done on sanitary grounds or to meet the wishes of relatives, and has been done for secular purposes, e.g., widening a thoroughfare, by allowing part of the burial ground (disused) to be thrown into it; (2) a licence from the Home Secretary, where it is desired to transfer remains from one unconsecrated place of burial to another; (3) by order of the coroner, in cases of suspected crime. See also CEMETERY, CREMATION, and FUNERAL RITES.

See Sir R. J. Phillimore, *Ecclesiastical Law* (2nd ed., 1895); J. B. Little, *The Law of Burial* (1901); E. Austin, *Burial Grounds and Cemeteries* (1907); Lord Parmoor, *Law of Church and Clergy* (7th ed., 1921).

**United States.**—Burial in the United States is carried out in three ways—earth burial, reposal in crypts in mausolea and cremation. Cremation accounts for only about 15,000 "burials" annually in this country. By far the greatest number of burials is in the earth, although it is true that the mausoleum idea is fast growing, due to the fact that land in metropolitan areas is becoming too valuable to be devoted to cemetery purposes. It is growing, too, because many people find the large marble and granite edifices, beautiful architecturally, and free from the contaminating influences of earth and water, have a strong psychological appeal as compared with the seemingly colder idea of earth burial.

Earth burials in the United States, compared with burials of half a century ago, have become a matter of gradually increasing refinement. Bodies are now encased in caskets of fine wood or metals; some of them made on special order are works of art costing, at times, many thousands of dollars. There is a growing custom of encasing the casket in a water-tight vermin-proof steel vault, affording greater protection to the body and casket in the ground. No longer does one see the hideous shaped coffins of pine, painted black or brown that were in use 50 years ago; nor does one see the coffin lowered into the grave by straps, but upon an automatic lowering device which slowly conveys the casket beyond the sight of those standing about. Clods of earth are not thrown into the grave on the casket, a bouquet of flowers serving the purpose of "dust to dust." Artificial grass covers the soil from the grave while the brief service is being pronounced, and a large special tent breaks the rays of the sun or protects from inclement

weather. Motor driven equipment has replaced the old horse-drawn hearse and hacks. The dingy "funeral parlours" have given way to the tasteful modern funeral home or mortuary. Gradually an increasing number of funerals are being held from these places instead of from the private home or the church. It is now almost a fixed custom to take the dead body from the place of death to the mortuary where it is made ready for burial. Very rarely now is the body removed from the mortuary until it is conveyed to the cemetery.

In the United States, as in most countries, every person has an inherent right of burial. The Jewish rites among the orthodox must take place within 24 hours of death, and the funeral and burial are most simple. Embalming is not done with this class; burial is only in a Jewish cemetery. Many Catholics still make use of the "wake," and burial takes place only in consecrated grounds; that is, in a Catholic cemetery. None outside the pale of the Roman Catholic church may be interred in a Catholic cemetery. Protestants make use of all three forms of burial, and, with the Catholics, usually wait the customary three days after death before interment.

While all men are entitled to a Christian burial, there are those who do not receive it. Those who are executed by the State for crimes committed, and whose bodies are not claimed by relatives or friends; those who meet death by violence and whose bodies cannot be identified after a stated period of time, and those who will their bodies to science. Many of these find their way to the dissecting tables. The bars are raised against the burial of no man in a Protestant cemetery if family or friends can meet the expense of a burial plot. Even the potter's field is usually attached to the cemetery proper, wherein are buried by the city or town those who cannot provide funds for a family plot or a single grave.

For the most part common law obtains in the United States in most matters pertaining to burials, although in various States the common law has been changed and extended by legislative acts. This is particularly true regarding rights of burial. In all States a burial cannot be made until the last physician attending a case has made a certificate as to the cause of death. With this in hand the funeral director secures from the city or town clerk, or other legal registrar, a burial permit. The sexton of the cemetery will not prepare a grave without the burial permit, nor allow a funeral party to enter the grounds of the cemetery. A disinterment for reinterment in the same cemetery, or in a distant cemetery, cannot be made without a special permit, usually at the hands of the local board of health.

Funerals and burials of bodies dead of a contagious or communicable disease must be private, and in some cases within 12 hours. No funeral is permitted for those dying from certain causes. Shipment of such cases must be in metal-lined containers, and in case of certain diseases may not be shipped beyond the confines of the town or city. While embalming as a general proposition is not required by law, it is in almost universal practice in the U.S.A. The transportation of bodies dead of smallpox, Asiatic cholera, yellow fever, typhus fever or bubonic plague, is absolutely forbidden. The bodies of those who have died from diphtheria (membranous croup), scarlet fever (scarlatina, scarlet rash), glanders, anthrax or leprosy, are not accepted for transportation unless prepared for shipment by being thoroughly disinfected by an arterial and cavity injection with an approved disinfectant fluid and washed with a disinfectant, all of the work being done by a licensed embalmer. The body must then be enclosed in an air-tight, hermetically sealed metal container. In case of typhoid fever, puerperal fever, erysipelas, tuberculosis and measles and other dangerous communicable diseases, not mentioned above, the body may be prepared by cavity embalming if it can reach its destination within 48 hours; otherwise both arterial and cavity embalming must be employed. A body dying from non-contagious or noncommunicable diseases may be shipped without the above precautions in a sound metal or wooden container if destination can be reached in 30 hours; otherwise sanitary precautions must be taken. An attendant may not accompany a body dead of contagious or communicable diseases unless he shall have taken proper sanitary precautions.

In determining who shall have the right to bury a dead human body, and upon whom falls the duty, the courts have brought out the commonly accepted ruling that a body has no value in a commercial sense; it cannot be attached, conveyed or taken on execution. In the case of *Bogart v. The City of Indianapolis* it was laid down "that the bodies of the dead belong to the surviving relations, in the order of inheritance as property, and that they have the right to dispose of them as such, within restrictions analogous to those by which the disposition of other property is regulated." That is, the husband or wife have first word as to the disposition of the remains of the other; children come second, and other relatives in the order of blood succession. Coroners for the purpose of an inquest possess priority over all others but only for that purpose, and during the time of an inquest. In case of a person meeting death by violence, or in some hidden manner, and identification of the victim cannot be established, then the coroner may order burial in the potter's field or the body may be sent to a definite institution for scientific uses. Captains of ocean-going vessels by common consent through the ages have had the right personally to attend to the burial of persons dying on their ships. They are also given that right by an Arizona statute. However, sea burials possess a great horror for those not living on the high seas, and most liners now possess facilities for embalming bodies, and they are delivered to the authorities at the home port. Surviving relations have the right to call for a *post mortem* examination, to select the kind of casket for burial, to determine the plans for the funeral and interment, and incidentally are held responsible for the cost. In the United States a man may by will determine the final disposition of his own remains, and to a limited extent this wish is usually respected.

Generally speaking the right to bury does not extend to a second burial; however, disinterments may be made upon the proper showing to a local board of health. If there be any contention among members of a family over removal of a body from one cemetery to another, it is a matter for court decision. Precedents have been established on this point in the courts of New Jersey, Massachusetts, Rhode Island and Missouri.

It has been established that a pauper parent is not obliged to bury his deceased child if he is not financially able; he need not even incur future financial obligation by borrowing money to take care of the expense, but may call upon the proper civic authorities to bear the burden. Neglect on the part of financially able parents or other relatives, properly to dispose of a dead body is a criminal offence in some States, punishable by a fine three times the cost of the burial. The expenses of any funeral constitute a priority charge against an estate whether specifically so stated in a will or not. Many probate courts have established a custom of allowing only a "reasonable charge" as the proper cost of a funeral, in case of a court contention, although no statute has ever been set up to govern the matter of the amount of charges for a funeral and the consequent burial. (H. J. D.)

**BURIAL SOCIETY**, a form of friendly society, existing mainly in England, and constituted for the purpose of providing by voluntary subscriptions, for insuring money to be paid on the death of a member, or for the funeral expenses of the husband, wife or child of a member, or of the widow of a deceased member. (See FRIENDLY SOCIETIES.)

**BURIAN VON RAJECZ, STEPHEN**, COUNT (1851-1922), Austro-Hungarian statesman, was born at Stampfen, near Presburg (Bratislava), Jan. 16 1851, of a Hungarian noble family. He entered the diplomatic service, spending many years in Moscow and in Sofia. From 1903 to 1912 he was finance minister and as such administered the provinces of Bosnia and Hercegovina. In June 1913 he was appointed Hungarian minister to the court of Vienna, and on Jan. 13 1915 he succeeded Count Berchtold at the Foreign Office. Burian was unable to prevent the secession of Italy into the ranks of the Entente, but he succeeded in arranging the alliances with Bulgaria and Turkey. With regard to Poland he advocated the creation of an independent state coequal with Austria-Hungary. In general, he maintained that in military, political and economic matters Austria-Hungary must be treated as an equal partner with Germany, her ally.

On the question of peace, too, there was a sharp antithesis between the views of Burian and those of German statesmen. He proposed, as early as Nov. 1915, that Germany should make a public declaration of her willingness to guarantee the national independence of Belgium, and during 1916 repeatedly urged that the way should be paved for negotiation with the enemy on the basis of the renouncing of conquests in the west. The peace note of Dec. 12 1916, which put an end to this quarrel, was the last important official act of Burian as foreign minister. A few days later he laid down his office, but was recalled after the resignation of his successor, Count Czernin, on April 15 1918. Burian now worked energetically for peace. On Sept. 14 1918, he addressed to all the belligerent nations an invitation to end the war by diplomatic negotiations. The invitation had no success; he therefore resigned, and from this time onwards ceased to take an active part in politics. He died at Vienna Oct. 20 1922.

See S. Burian von Rajecz, *Drei Jahre aus der Zeit meiner Amtsführung im Kriege* (1923), Eng. tran. *Austria in Dissolution* (1923).

**BURIAT MONGOL REPUBLIC**, an autonomous Socialist Soviet Republic in Asiatic Russia, created as a region in Jan. 1922, and as a republic in Sept. 1923. Area 419,000sq.km. Pop. (1926) 522,093; urban 36,523, rural 485,570. The republic consists of detached parts related to the life of the Buriat herdsmen and cultivators. On the south-east there is a detached Buriat area, south of Chita, surrounded by the Chita province, near the Mongolian frontier, between the Yablonoi and Nerchinsk ranges; this is an area of sub-alpine meadows and sluggish streams. The main part of the republic consists primarily of part of the Vitim plateau, east of Lake Baikal, but the high west border of the lake is also included. From this main area the republic projects westwards along two highland lines, one following the Sayan mountains south and west of Baikal as far as the source of the River Iya, the other following the western tongue of hills north of the Angara valley, having a small detached highland piece at its western end. The Angara valley and the coast of Baikal north and south of it are in the Irkutsk province of the Siberian area (*q.v.*). The Buriats are a Mongol people, broad shouldered, stout, small, with slanting eyes, high cheekbones and broad, flat noses. They are skilful horse and cattle breeders, hunters and fishers. Many are still nomadic herdsmen, going in summer to the more exposed and higher Alpine meadows, in autumn to the mown meadows (thus providing manure for the cultivators), in winter to places sheltered from the biting winds and in spring to those places where the snow melts earliest. Sometimes spring snowstorms cause much damage to the flocks and herds. The hunters trap squirrel and other fur-bearing animals, and also the maral deer, valued for its horns. Fishing is extensively carried on, and has much developed with improved steamer traffic. Many Buriats, however, have given up the nomadic life and become settled cultivators. The areas where crops are raised show an interesting relation to orography, since they are all in the river valleys, chiefly in the south-east of the main area, *i.e.*, the valleys of the Selenga, Khilky, Chikoyu and Uda rivers: the areas bordering these rivers, Verkhne Udinsk, Selenga and Troitskosavsk, have 46% of the ploughed lands in the republic. Verkhne Udinsk is most densely sown, with 158,200 hectares out of the total 498,000 ploughed in the republic. The crops grown are rye 48.8%, oats 19.3%, wheat 17.4%, buckwheat 6.9%, barley 3.5%, grasses 2.3%, potatoes 1.5% of the total harvest. In the north-east of the republic (the Vitim plateau) there is no agriculture except for a sparse sowing along the valley of the Barguzin river, 6,000 hectares (1.2% of the whole sown area).

The mountain area south-east of Lake Baikal fringes the high Asiatic plateaus. A little east of the lake the broad deep Uda valley from the north-east joins the Selenga valley which runs north from Kiakhta and affords routes to the Gobi desert. The Trans-Siberian railway cuts across between the Uda and Selenga valleys eastward to the Khilok valley and Chita. The Barguzin mountains (7,000-8,000ft.) to the north-east of the lake and the Khamar Daban mountains (6,900ft.), south of the Selenga river, make communication difficult. Thick forests of larch, fir and cedar clothe these ridges, whose dome-shaped summits rise above

the vegetation, but not the snow-line. The high plateau region is intersected by the picturesque valleys of the Barguzin river (to Lake Baikal) and the Zyra and Muga (to Vitim river). It is undulating, with ridges (1,500–2,000 ft.) crossing it, and has broad, flat, marshy valleys, with sluggish, meandering streams, the better drained valleys having fine meadows for pasture. Glaciers existed and in post-glacial times numerous lakes (around whose shores are remains of Neolithic settlements): the lakes are drying and some have completely disappeared. The climate of the republic is on the whole exceedingly dry, with cold winters and hot summers. The rivers are frozen 160 days in the south and 180 in the north. Lake Baikal modifies the climate and the winter isotherms curve strikingly north, especially during freezing, when open water and the liberation of latent heat combine to warm the air and fogs develop. Conversely the summer isotherms bend south, and the range of temperature varies with distance from the lake 14.0° F Jan. to 60.8° F July on the Selenga delta, but –4.0° F Jan. to 71.6° F July farther east. Deep snow covers the mountains round the lake in winter. Earthquakes are frequent in the Selenga delta area and extend to Irkutsk, Barguzin and Selenginsk, and mineral springs are numerous, hot alkaline springs (130° F) at Turka, near the mouth of the Barguzin and at Pogromna on the Uda (similar to the Seltzer springs).

The province has mineral wealth, much of it not yet exploited: iron is mined on the south-east of Lake Baikal, on the Khamardaban slopes, manganese near the left bank of the mouth of the Upper Angara, and gold on the slopes of the north-east plateau. The Trans-Siberian railway passes round the south of the lake and through Verkhne Udinsk up the Khilok valley, and has helped to develop the resources of the area. Trains are also ferried from Listvinichnoe on the Irkutsk coast of the lake to Misovaya (Misovsk) south of the Selenga river, and an ice-breaker is now in use. Steamers ply weekly between these two ports and ascend the Selenga river to the Mongolian frontier, importing brick tea via Kiakhta. Grain, cedar nuts, salt, soda, wool and timber are shipped on rafts down the Khilok, Chikoyu and Uda rivers (tributaries of the Selenga) and manufactured goods are taken up the river for export to China. Furs are exported in quantity, especially squirrel, and fish export has developed with improved steamer traffic. The chief towns are Verkhne Udinsk (*q.v.*), pop. (1926) 21,647, Troitskosavsk with Kiakhta pop. (1926) 8,474, an important trading centre on the Mongolian frontier and Barguzin pop. (1926) 2,217, at the mouth of the Barguzin.

The Buriats were conquered by the Russians at the end of the 17th century. Many of them are literate and possess books of their own translated from Tibetan to Mongolian, and the cultivators are progressive and keen to increase education, but amongst the nomad herdsmen education presents great difficulties and many of their children, especially the girls, receive no school education.

**BURIATS.** The Buriats are a Mongol tribe, and are said to be an offshoot of the Khalkha Mongols. Their centre of dispersion to-day is Transbaikalia, but they are confirmed wanderers and are to be found from the Amur river to Lhasa. Some of the Buriats practise agriculture, but their chief occupation is the rearing of horses and cattle, and large numbers are steppe dwellers, with a culture similar to the other Mongol tribes (*see* MONGOL). Physically they are very much mixed and it is not possible to speak of a Buriat physical type; in religion they are Buddhists, but Shamanism still survives among them.

**BURIDAN, JEAN** (JOANNES BURIDANUS) (*c.* 1297–*c.* 1358), French philosopher, was born at Béthune in Artois. He studied under William of Occam in Paris where he became professor of philosophy, and, in 1327, rector. The tradition that he was forced to flee from France along with other Nominalists, and founded the University of Vienna in 1356, is unsupported and in contradiction to the fact that the university was founded by Frederick II. in 1237. An ordinance of Louis XI., in 1473, directed against the Nominalists, prohibited the reading of his works. In philosophy Buridan followed Occam in denying all objective reality to universals. The aim of his logic is represented as having been the devising of rules for the discovery of syllogistic middle

terms; this system for aiding slow-witted persons became known as the *pons asinorum*. The parts of logic which he treated with most minuteness are modal propositions and modal syllogisms. In commenting on Aristotle's *Ethics*, Buridan asserts that liberty is only a certain power of suspending the deliberative process and determining the direction of the intellect. Otherwise the will is entirely dependent on the intellect. The comparison of the will unable to act between two equally balanced motives to an ass dying of hunger between two equal and equidistant bundles of hay is not found in his works, and may have been invented by his opponents to ridicule his determinism. Buridan is also conspicuous for his departure from Aristotelian physics in his impetus theory of movement.

His works are:—*Summula de dialectica* (1487); *Compendium logicae* (1489); *Quaestiones in viii. libros physicorum* (1516); *In Aristotelis Metaphysica* (1518); *Quaestiones in x. libros ethicorum Aristotelis* (1489; 1637); *Quaestiones in viii. libros politicorum Aristotelis* (1500). *See* K. Prantl's *Geschichte der Logik*, bk. iv. 14–38; Stockl's *Geschichte der Philosophie des Mittelalters*, ii. 1023–28; J. Verwey, *Das Problem d. Willensfreiheit in der Scholastik* (1909); P. Duhem, *Études sur Léonard de Vinci 2<sup>e</sup> et 3<sup>e</sup> série* (1909).

**BURIN.** The term “burin” or graving tool (Fr.) is applied to a flint tool of the Upper Palaeolithic—Aurignacian—period. It is marked by a facet produced by a blow from the working point lengthwise as is proved in genuine cases by small negative bulbs of percussion. In one variety of the two main forms the working edge is straight like a screwdriver, in the other, curved like a gouge. These types are further subdivided into classes distinguishable by the methods of formation and the faceting produced thereby in relation to the edge which may be straight, concave or convex. A beaked graver notable in Middle Aurignacian periods has a convex edge and has two typical forms, one with, the other without, a notch, the purpose of which is to retain the convex facets.

*See* M. C. Burkitt, *Prehistory* (1925).

**BURKBURNETT**, a city of Wichita county (Texas), U.S.A., in the fertile valley of the Red river, within two m. of the Oklahoma border. It is served by the Missouri-Kansas-Texas railway. Two m. east is a free highway bridge of concrete and steel, built jointly (1927) by the two States and the counties immediately served. The town site of Burkburnett was laid out in 1907. In 1914, when the city was incorporated, the population was about 1,200; in 1920 it was 5,300; in 1930, 3,281 by the Federal census. It is the centre of a large oil-field, which became important in 1917. During the boom period (1919–21) the town site was drilled with from one to five wells per block. In 1927 about 100 wells within the city were still producing, and the output of the Burkburnett field was about 15,000 bbl. per day. The city has three refineries, and numerous casing-head gas plants. A commission-manager form of government was adopted in 1923.

**BURKE, SIR JOHN BERNARD** (1814–1892), British genealogist, was born in London, Jan. 5, 1814, and was educated in London and in France. His father, John Burke (1787–1848), was also a genealogist, and in 1826 issued a *Genealogical and Heraldic Dictionary of the Peerage and Baronetage of the United Kingdom*. This work, generally known as *Burke's Peerage*, has been issued annually since 1847. While practising as a barrister Bernard Burke assisted his father in his genealogical work, and in 1848 took control of his publications. In 1853 he was appointed Ulster king-at-arms; in 1854 he was knighted, and in 1855 he became keeper of the state papers in Ireland. Burke also brought out several editions of a companion volume to the *Peerage*, *Burke's Landed Gentry*, which was first published between 1833 and 1838. In 1866 and 1883 he edited his father's *Dictionary of the Peerages of England, Scotland and Ireland, extinct, dormant and in abeyance* (earlier editions, 1831, 1840, 1846); in 1855 and 1876 editions of his *Royal Families of England, Scotland and Wales* (1st ed. 1847–51); and in 1878 and 1883 enlarged editions of his *Encyclopaedia of Heraldry, or General Armoury of England, Scotland and Ireland*.

Burke's own works include *The Roll of Battle Abbey* (1848); *The Romance of the Aristocracy* (1855); *Vicissitudes of Families* (1883, and several earlier editions); and *The Rise of Great Families* (1882). He was succeeded as editor of *Burke's Peerage and Landed Gentry* by his fourth son, Ashworth Peter Burke.

**BURKE, EDMUND** (1729-1797), British statesman and political writer. His is one of the greatest names in the history of political literature. There have been many more important statesmen, for he was never tried in a position of supreme responsibility. There have been many more effective orators, for lack of imaginative suppleness prevented him from penetrating to the inner mind of his hearers; defects in delivery weakened the intrinsic persuasiveness of his reasoning; and he had not that commanding authority of character and personality which has so often been the secret of triumphant eloquence. There have been many subtler, more original and more systematic thinkers about the conditions of the social union. But no one that ever lived used the general ideas of the thinker more successfully to judge the particular problems of the statesman. No one has ever come so close to the details of practical politics, and at the same time remembered that these can only be understood and only dealt with by the aid of the broad conceptions of political philosophy. And what is more than all for perpetuity of fame, he was one of the great masters of the high and difficult art of elaborate composition.

A certain doubtfulness hangs over the circumstances of Burke's life previous to the opening of his public career. The very date of his birth is variously stated. The most probable opinion is that he was born at Dublin on Jan. 12, 1729, new style. Of his family we know little more than that his father was a Protestant attorney, practising in Dublin, and that his mother was a Catholic, a member of the family of Nagle. He had at least one sister, from whom descended the only existing representatives of Burke's family; and he had at least two brothers, Garret Burke and Richard Burke, the one older and the other younger than Edmund. The sister, afterwards Mrs. French, was brought up and remained throughout life in the religious faith of her mother; Edmund and his brothers followed that of their father. In 1741 the three brothers were sent to school at Ballitore in the county of Kildare, kept by Abraham Shackleton, an Englishman, and a member of the Society of Friends. He appears to have been an excellent teacher and a good and pious man. Burke always looked back on his own connection with the school at Ballitore as among the most fortunate circumstances of his life. Between himself and a son of his instructor there sprang up a close and affectionate friendship, and, unlike so many of the exquisite attachments of youth, this was not choked by the dust of life, nor parted by divergence of pursuit. Richard Shackleton was endowed with a grave, pure and tranquil nature, constant and austere, yet not without those gentle elements that often redeem the drier qualities of his religious persuasion. When Burke had become one of the most famous men in Europe, no visitor to his house was more welcome than the friend with whom long years before he had tried poetic flights, and exchanged all the sanguine confidences of boyhood. And we are touched to think of the simple-minded guest secretly praying, in the solitude of his room in the fine house at Beaconsfield, that the way of his anxious and overburdened host might be guided by a divine hand.

In 1743 Burke became a student at Trinity college, Dublin, where Oliver Goldsmith was also a student at the same time. But the serious pupil of Abraham Shackleton would not be likely to see much of the wild and squalid sizar. Henry Flood, who was two years younger than Burke, had gone to complete his education at Oxford. Burke, like Goldsmith, achieved no academic distinction. His character was never at any time of the academic cast. The minor accuracies, the limitation of range, the treading and retreading of the same small patch of ground, the concentration of interest in success before a board of examiners, were all uncongenial to a nature of exuberant intellectual curiosity and of strenuous and self-reliant originality. His knowledge of Greek and Latin was never thorough, nor had he any turn for critical niceties. He could quote Homer and Pindar, and he had read Aristotle. Like others who have gone through the conventional

course of instruction, he kept a place in his memory for the various charms of Virgil and Horace, of Tacitus and Ovid; but the master whose page by night and by day he turned with devout hand, was the copious, energetic, flexible, diversified and brilliant genius of the declamations for Archias, the poet, and for Milo, against Catiline and against Antony, the author of the disputations at Tusculum and the orations against Verres. Cicero was ever to him the mightiest of the ancient names. In English literature Milton seems to have been more familiar to him than Shakespeare, and Spenser was perhaps more of a favourite with him than either.

It is too often the case to be a mere accident that men who become eminent for wide compass of understanding and penetrating comprehension, are in their adolescence unsettled and desultory. Of this Burke is a signal illustration. He left Trinity in 1748, with no great stock of well-ordered knowledge. He neither derived the benefits nor suffered the drawbacks of systematic intellectual discipline.

#### EARLY MANHOOD

After taking his degree at Dublin he went in the year 1750 to London to keep terms at the Temple. The ten years that followed were passed in obscure industry. Burke was always extremely reserved about his private affairs. All that we know of Burke exhibits him as inspired by a resolute pride, a certain stateliness and imperious elevation of mind. Such a character, while free from any weak shame about the shabby necessities of early struggles, yet is naturally unwilling to make them prominent in after life. There is nothing dishonourable in such an inclination. "I was not swaddled and rocked and dandled into a legislator," wrote Burke when very near the end of his days: "*Nitor in adversum* is the motto for a man like me. At every step of my progress in life (for in every step I was traversed and opposed), and at every turnpike I met, I was obliged to show my passport. Otherwise no rank, no toleration even, for me."

All sorts of whispers have been circulated by idle or malicious gossip about Burke's first manhood. He is said to have been one of the numerous lovers of his fascinating countrywoman, Margaret Woffington. It is hinted that he made a mysterious visit to the American colonies. He was for years accused of having gone over to the Church of Rome, and afterwards recanting. There is not a tittle of positive evidence for these or any of the other statements to Burke's discredit. The common story that he was a candidate for Adam Smith's chair of moral philosophy at Glasgow, when Hume was rejected in favour of an obscure nobody (1751), can be shown to be wholly false. Like a great many other youths with an eminent destiny before them, Burke conceived a strong distaste for the profession of the law. His father, who was an attorney of substance, had a distaste still stronger for so vagrant a profession as letters were in that day. He withdrew the annual allowance, and Burke set to work to win for himself by indefatigable industry and capability in the public interest that position of power or pre-eminence which his detractors acquired either by accident of birth and connections or else by the vile arts of political intrigue. He began at the bottom of the ladder, mixing with the Bohemian society that haunted the Temple, practising oratory in the free and easy debating societies of Covent Garden and the Strand, and writing for the booksellers.

In 1756 he made his first mark by a satire upon Bolingbroke entitled *A Vindication of Natural Society*. It purported to be a posthumous work from the pen of Bolingbroke, and to present a view of the miseries and evils arising to mankind from every species of artificial society. The imitation of the fine style of that magnificent writer but bad patriot is admirable. As a satire the piece is a failure, for the simple reason that the substance of it might well pass for a perfectly true, no less than a very eloquent statement of social blunders and calamities. Such acute critics as Chesterfield and Warburton thought the performance serious. Rousseau, whose famous discourse on the evils of civilization had appeared six years before, would have read Burke's ironical vindication of natural society without a suspicion of its irony. There have indeed been found persons who insist that the *Vindication* was a really serious expression of the writer's own opinions. This

is absolutely incredible, for various reasons. Burke felt now, as he did thirty years later, that civil institutions cannot wisely or safely be measured by the tests of pure reason. His sagacity discerned that the rationalism by which Bolingbroke and the deistic school believed themselves to have overthrown revealed religion was equally calculated to undermine the structure of political government. This was precisely the actual course on which speculation was entering in France at that moment. His *Vindication* is meant to be a reduction to an absurdity. The rising revolutionary school in France, if they had read it, would have taken it for a demonstration of the theorem to be proved. The only interest of the piece for us lies in the proof which it furnishes, that at the opening of his life Burke had the same scornful antipathy to political rationalism which flamed out in such overwhelming passion at its close.

In the same year (1756) appeared the *Philosophical Inquiry into the Origin of our Ideas on the Sublime and Beautiful*, a crude and narrow performance in many respects, yet marked by an independent use of the writer's mind, and not without fertile suggestion. It attracted the attention of the rising aesthetic school in Germany. Lessing set about the translation and annotation of it, and Moses Mendelssohn borrowed from Burke's speculation at least one of the most fruitful and important ideas of his own influential theories on the sentiments. In England the *Inquiry* had considerable vogue, but it has left no permanent trace in the development of aesthetic thought.

Burke's literary industry in town was relieved by frequent excursions to the western parts of England, in company with William Burke. There was a lasting intimacy between the two namesakes, and they seem to have been involved together in some important passages of their lives; but we have Edmund Burke's authority for believing that they were probably not kinsmen. The seclusion of these rural sojourns, originally dictated by delicate health, was as wholesome to the mind as to the body. Few men, if any, have ever acquired a settled mental habit of surveying human affairs broadly, of watching the play of passion, interest, circumstance, in all its comprehensiveness, and of applying the instruments of general conceptions and wide principles to its interpretation with respectable constancy, unless they have at some early period of their manhood resolved the greater problems of society in independence and isolation. By 1756 the cast of Burke's opinions was decisively fixed, and they underwent no radical change.

He began a series of *Hints on the Drama*. He wrote a portion of an *Abridgment of the History of England*, and brought it down as far as the reign of John. It included, as was natural enough in a warm admirer of Montesquieu, a fragment on law, of which he justly said that it ought to be the leading science in every well-ordered commonwealth. Burke's early interest in America was shown by an *Account of the European Settlements* on that continent. Such works were evidently a sign that his mind was turning away from abstract speculation to the great political and economic fields, and to the more visible conditions of social stability and the growth of nations. This interest in the concrete phenomena of society inspired him with the idea of the *Annual Register* (1759), which he designed to present a broad grouping of the chief movements of each year. The execution was as excellent as the conception, and if we reflect that it was begun in the midst of that momentous war which raised England to her climax of territorial greatness in East and West, we may easily realize how the task of describing these portentous and far-reaching events would be likely to strengthen Burke's habits of wide and laborious observation, as well as to give him firmness and confidence in the exercise of his own judgment. Dodsley gave him £100 for each annual volume, and the sum was welcome enough, for towards the end of 1756 Burke had married. His wife was the daughter of a Dr. Nugent, a physician at Bath. She was always spoken of by his friends as a mild, reasonable and obliging person, whose amiability and gentle sense did much to soothe the too nervous and excitable temperament of her husband. She had been brought up, there is good reason to believe, as a Catholic, and she was probably a member of that communion at the

time of her marriage. Dr. Nugent eventually took up his residence with his son-in-law in London, and became a popular member of that famous group of men of letters and artists whom Boswell has made so familiar and so dear to all later generations. Burke, however, had no intention of being dependent. His consciousness of his own powers animated him with a most justifiable ambition, if ever there was one, to play a part in the conduct of national affairs. Friends shared this ambition on his behalf; one of these was Lord Charlemont. He introduced Burke to William Gerard Hamilton (1759), now only remembered by the nickname "single-speech," derived from the circumstance of his having made a single brilliant speech in the House of Commons, which was followed by years of almost unbroken silence. Hamilton was by no means devoid of sense and acuteness, but in character he was one of the most despicable men then alive. There is not a word too many nor too strong in the description of him by one of Burke's friends, as "a sullen, vain, proud, selfish, cankered-hearted, envious reptile." The reptile's connection, however, was for a time of considerable use to Burke. When he was made Irish secretary, Burke accompanied him to Dublin, and there learnt Oxenstiern's eternal lesson, that awaits all who penetrate behind the scenes of government, *quam parva sapientia mundus regitur*.

#### BURKE THE PATRIOT

The penal laws against the Catholics, the iniquitous restrictions on Irish trade and industry, the selfish factiousness of the parliament, the jobbery and corruption of administration, the absenteeism of the landlords, and all the other too familiar elements of that mischievous and fatal system, were then in full force. As was shown afterwards, they made an impression upon Burke that was never effaced. So much iniquity and so much disorder may well have struck deep on one whose two chief political sentiments were a passion for order and a passion for justice. He may have anticipated with something of remorse the reflection of a modern historian, that the absenteeism of her landlords has been less of a curse to Ireland than the absenteeism of her men of genius. At least he was never an absentee in heart. He always took the interest of an ardent patriot in his unfortunate country; and, as we shall see, made more than one weighty sacrifice on behalf of the principles which he deemed to be bound up with her welfare.

When Hamilton retired from his post, Burke accompanied him back to London, with a pension of £300 a year on the Irish Establishment. This modest allowance he hardly enjoyed for more than a single year. His patron having discovered the value of so laborious and powerful a subaltern, wished to bind Burke permanently to his service. Burke declined to sell himself into final bondage of this kind. When Hamilton continued to press his odious pretensions they quarrelled (1765), and Burke threw up his pension. He soon received a more important piece of preferment than any which he could ever have procured through Hamilton.

The accession of George III. to the throne in 1760 had been followed by the disgrace of Pitt, the dismissal of Newcastle, and the rise of Bute. These events marked the resolution of the court to change the political system which had been created by the revolution of 1688. That system placed the government of the country in the hands of a territorial oligarchy, composed of a few families of large possessions, fairly enlightened principles, and shrewd political sense. It had been preserved by the existence of a Pretender. The first two kings of the house of Hanover could keep the crown on their own heads only by conciliating the Revolutionary families and accepting Revolution principles. By 1760 all peril to the dynasty was at an end. George III., or those about him, insisted on substituting for the aristocratic division of political power a substantial concentration of it in the hands of the sovereign. The ministers were no longer to be the members of a great party, acting together in pursuance of a common policy accepted by them all as a united body; they were to become nominees of the court, each holding himself answerable not to his colleagues but to the king, separately, individually, and by department. George III. had before his eyes the government of his cousin, the great Frederick; but not every one can bend the bow of Ulysses, and, apart from difference of personal capacity and

historic tradition, he forgot that a territorial and commercial aristocracy cannot be dealt with in the spirit of the barrack and the drill-ground. But he made the attempt, and resistance to that attempt supplies the keynote to the first 25 years of Burke's political life.

Along with the change in system went high-handed and absolutist tendencies in policy. The first stage of the new experiment was very short. Bute, in a panic at the storm of unpopularity that menaced him, resigned in 1763. George Grenville and the less enlightened section of the Whigs took his place. They proceeded to tax the American colonists, to interpose vexatiously against their trade, to threaten the liberty of the subject at home by general warrants, and to stifle the liberty of public discussion by prosecutions of the press. Their arbitrary methods disgusted the nation, and the personal arrogance of the ministers at last disgusted the king. The system received a temporary check. Grenville fell, and the king was forced to deliver himself into the hands of the orthodox section of the Whigs. The marquess of Rockingham (July 10, 1765) became prime minister, and he was induced to make Burke his private secretary. Before Burke had begun his duties, an incident occurred which illustrates the character of the two men. The old duke of Newcastle, probably desiring a post for some nominee of his own, conveyed to the ear of the new minister various absurd rumours prejudicial to Burke—that he was an Irish papist, that his real name was O'Bourke, that he had been a Jesuit, that he was an emissary from St. Omer's. Lord Rockingham repeated these tales to Burke, who of course denied them with indignation. His chief declared himself satisfied, but Burke, from a feeling that the indispensable confidence between them was impaired, at once expressed a strong desire to resign his post. Lord Rockingham prevailed upon him to reconsider his resolve, and from that day until Lord Rockingham's death in 1782, their relations were those of the closest friendship and confidence.

The first Rockingham administration lasted only a year and a few days, ending in July 1766. The uprightness and good sense of its leaders did not compensate for the weakness of their political connections. They were unable to stand against the coldness of the king, against the hostility of the powerful and selfish faction of Bedford Whigs, and, above all, against the towering predominance of William Pitt. That Pitt did not join them is one of the many fatal miscarriages of history, as it is one of the many serious reproaches to be made against that extraordinary man's chequered and uneven course. An alliance between Pitt and the Rockingham party was the surest guarantee of a wise and liberal policy towards the colonies. He went farther than they did, in holding, like Lord Camden, the doctrine that taxation went with representation, and that therefore parliament had no right to tax the unrepresented colonists. The ministry asserted, what no competent jurist would now think of denying, that parliament is sovereign; but they went heartily with Pitt in pronouncing the exercise of the right of taxation in the case of the American colonists to be thoroughly impolitic and inexpedient. No practical difference, therefore, existed upon the important question of the hour. But Pitt's prodigious egoism, stimulated by the mischievous counsels of men of the stamp of Lord Shelburne, prevented the fusion of the only two sections of the Whig party that were at once able, enlightened and disinterested enough to carry on the government efficiently, to check the arbitrary temper of the king, and to command the confidence of the nation. Such an opportunity did not return.

#### WHIG PARTY'S INSPIRATION

The ministerial policy towards the colonies was defended by Burke with splendid and unanswerable eloquence. He had been returned to the House of Commons for the pocket borough of Wendover, and his first speech (Jan. 27, 1766) was felt to be the rising of a new light. For the space of a quarter of a century, from this time down to 1790, Burke was one of the chief guides and inspirers of a revived Whig party. The "age of small factions" was now succeeded by an age of great principles, and selfish ties of mere families and persons were transformed into a union resting on common conviction and patriotic aims. It was

Burke who did more than any one else to give to the Opposition, under the first half of the reign of George III., this stamp of elevation and grandeur. Before leaving office the Rockingham government repealed the Stamp act; confirmed the personal liberty of the subject by forcing on the House of Commons one resolution against general warrants, and another against the seizure of papers; and relieved private houses from the intrusion of officers of excise, by repealing the cider tax. Nothing so good was done in an English parliament for nearly twenty years to come. George Grenville, whom the Rockinghams had displaced, and who was bitterly incensed at their formal reversal of his policy, printed a pamphlet to demonstrate his own wisdom and statesmanship. Burke replied in his *Observations on a Late Publication on the Present State of the Nation* (1769), in which he showed for the first time that he had not only as much knowledge of commerce and finance, and as firm a hand, in dealing with figures as Grenville himself, but also a broad, general and luminous way of conceiving and treating politics in which neither then nor since has he had any rival among English publicists.

It is one of the perplexing points in Burke's private history to know how he lived during these long years of parliamentary opposition. It is certainly not altogether mere impertinence to ask of a public man how he gets what he lives upon, for independence of spirit, which is so hard to the man who lays his head on the debtor's pillow, is the prime virtue in such men. Probity in money is assuredly one of the keys to character, though we must be very careful in ascertaining and proportioning all the circumstances. Now, in 1769, Burke bought an estate at Beaconsfield, in the county of Buckingham. It was about 600 acres in extent, was worth some £500 a year, and cost £22,000. People have been asking ever since how the penniless man of letters was able to raise so large a sum in the first instance, and how he was able to keep up a respectable establishment afterwards. The suspicions of those who are never sorry to disparage the great have been of various kinds. Burke was a gambler, they hint, in Indian stock, like his kinsmen Richard and William, and like Lord Verney, his political patron at Wendover. Perhaps again, his activity on behalf of Indian princes, like the raja of Tanjore, was not disinterested and did not go unrewarded. The answer to all these calumnious innuendoes is to be found in documents and titles of decisive authority, and is simple enough. It is, in short, this. Burke inherited a small property from his elder brother, which he realized. Lord Rockingham advanced him a certain sum (£6,000). The remainder, amounting to no less than two-thirds of the purchase-money, was raised on mortgage, and was never paid off during Burke's life. The rest of the story is equally simple, but more painful. Burke made some sort of income out of his 600 acres; he was for a short time agent for New York, with a salary of £700; he continued to work at the *Annual Register* down to 1788. But, when all is told, he never made as much as he spent; and in spite of considerable assistance from Lord Rockingham, amounting it is sometimes said to as much as £30,000, Burke, like the younger Pitt, got every year deeper into debt. Pitt's debts were the result of a wasteful indifference to his private affairs. Burke, on the contrary, was assiduous and orderly, and had none of the vices of profusion. But he had that quality which Aristotle places high among the virtues—the noble mean of magnificence, standing midway between the two extremes of vulgar ostentation and narrow pettiness. He was indifferent to luxury, and sought to make life, not commodious nor soft, but high and dignified in a refined way. He loved art, filled his house with statues and pictures, and extended a generous patronage to the painters. He was a collector of books, and, as Crabbe and less conspicuous men discovered, a helpful friend to their writers. Guests were ever welcome at his board; the opulence of his mind and the fervid copiousness of his talk naturally made the guests of such a man very numerous. *Non invideo equidem, miror magis*, was Johnson's good-natured remark, when he was taken over his friend's fine house and pleasant gardens. Johnson was of a very different type. There was something in this external dignity which went with Burke's imperious spirit, his spacious imagination, his turn for all things stately and imposing. We may say,

if we please, that Johnson had the far truer and loftier dignity of the two; but we have to take such men as Burke with the defects that belong to their qualities. And there was no corruption in Burke's outlay. When the Pitt administration was formed in 1766, he might have had office, and Lord Rockingham wished him to accept it, but he honourably took his fate with the party. He may have spent £3,000 a year, where he would have been more prudent to spend only £2,000. But nobody was wronged; his creditors were all paid in time, and his hands were at least clean of traffic in reversions, clerkships, tellerships and all the rest of the rich sinecures which it was thought no shame in those days for the aristocracy of the land and the robe to wrangle for, and gorge themselves upon, with the fierce voracity of famishing wolves. The most we can say is that Burke, like Pitt, was too deeply absorbed in beneficent service in the affairs of his country, to have for his own affairs the solicitude that would have been prudent.

In the midst of intense political preoccupations, Burke always found time to keep up his intimacy with the brilliant group of his earlier friends. He was one of the commanding figures at the club at the Turk's Head, with Reynolds and Garrick, Goldsmith and Johnson. The old sage who held that the first Whig was the Devil, was yet compelled to forgive Burke's politics for the sake of his magnificent gifts. "I would not talk to him of the Rockingham party," he used to say; "but I love his knowledge, his genius, his diffusion and affluence of conversation." And everybody knows Johnson's vivid account of him: "Burke, sir, is such a man that if you met him for the first time in the street, where you were stopped by a drove of oxen, and you and he stepped aside to take shelter but for five minutes, he'd talk to you in such a manner that when you parted you would say, 'This is an extraordinary man.'" They all grieved that public business should draw to party what was meant for mankind. They deplored that the nice and difficult test of answering Berkeley had not been undertaken, as was once intended, by Burke, and sighed "to think what an admirable display of subtlety and brilliance such a contention would have afforded them, had not politics 'turned him from active philosophy aside.'" There was no jealousy in this. They did not grudge Burke being the first man in the House of Commons, for they admitted that he would have been the first man anywhere.

With all his hatred for the book-man in politics, Burke owed much of his own distinction to that generous richness and breadth of judgment which had been ripened in him by literature and his practice in it. He showed that books are a better preparation for statesmanship than early training in the subordinate posts and among the permanent officials of a public department. There is no copiousness of literary reference in his work, such as overabounded in the civil and ecclesiastical publicists of the 17th century. Nor can we truly say that there is much, though there is certainly some, of that tact which literature is alleged to confer on those who approach it in a just spirit and with the true gift. The influence of literature on Burke lay partly in the direction of emancipation from the mechanical formulae of practical politics; partly in the association which it engendered, in a powerful understanding like his, between politics and the moral forces of the world, and between political maxims and the old and great sentences of morals; partly in drawing him, even when resting his case on prudence and expediency, to appeal to the widest and highest sympathies; partly, and more than all, in opening his thoughts to the many conditions, possibilities and "varieties of untried being," in human character and situation, and so giving an incomparable flexibility to his methods of political approach.

This flexibility is not to be found in his manner of composition. That derives its immense power from other sources; from passion, intensity, imagination, size, truth, cogency of logical reason. Those who insist on charm, on winningness in style, on subtle harmonies and fine exquisiteness of suggestion, are disappointed in Burke: they even find him stiff and over-coloured. And there are blemishes of this kind. His banter is nearly always ungainly, his wit blunt, as Johnson said, and often unseasonable. As is usual with

a man who has not true humour, Burke is also without true pathos. The thought of wrong or misery moved him less to pity for the victim than to anger against the cause. Again, there are some gratuitous and unredeemed vulgarities; some images that make us shudder. But only a literary fop can be detained by specks like these.

#### LITERARY STYLE

The varieties of Burke's literary or rhetorical method are very striking. It is almost incredible that the superb imaginative amplification of the description of Hyder Ali's descent upon the Carnatic should be from the same pen as the grave, simple, unadorned *Address to the King* (1777), where each sentence falls on the ear with the accent of some golden-tongued oracle of the wise gods. His stride is the stride of a giant, from the sentimental beauty of the picture of Marie Antoinette at Versailles, or the red horror of the tale of Debi Sing in Rungpore, to the learning, positiveness and cool judicial mastery of the *Report on the Lords' Journals* (1794), which Philip Francis, no mean judge, declared on the whole to be the "most eminent and extraordinary" of all his productions. But even in the coolest and driest of his pieces there is the mark of greatness, of grasp, of comprehension. In all its varieties Burke's style is noble, earnest, deep-flowing, because his sentiment was lofty and fervid, and went with sincerity and ardent disciplined travail of judgment. He had the style of his subjects; the amplitude, the weightiness, the laboriousness, the sense, the high flight, the grandeur, proper to a man dealing with imperial themes, with the fortunes of great societies, with the sacredness of law, the freedom of nations, the justice of rulers. Burke will always be read with delight and edification, because in the midst of discussions on the local and the accidental, he scatters apophthegms that take us into the regions of lasting wisdom. In the midst of the torrent of his most strenuous and passionate deliverances, he suddenly rises aloof from his immediate subject, and in all tranquillity reminds us of some permanent relation of things, some enduring truth of human life or human society. We do not hear the organ tones of Milton, for faith and freedom had other notes in the 18th century. There is none of the complacent and wise-browed sagacity of Bacon, for Burke's were days of personal strife and fire and civil division. We are not exhilarated by the cheerfulness, the polish, the fine manners of Bolingbroke, for Burke had an anxious conscience, and was earnest and intent that the good should triumph. And yet Burke is among the greatest of those who have wrought marvels in the prose of the English tongue.

Not all the transactions in which Burke was a combatant could furnish an imperial theme. We need not tell over again the story of Wilkes and the Middlesex election. The Rockingham ministry had been succeeded by a composite government, of which it was intended that Pitt, now made Lord Chatham and privy seal, should be the real chief. Chatham's health and mind fell into disorder almost immediately after the ministry had been formed. The duke of Grafton was its nominal head, but party ties had been broken, the political connections of the ministers were dissolved, and, in truth, the king was now at last a king indeed, who not only reigned but governed. The revival of high doctrines of prerogative in the crown was accompanied by a revival of high doctrines of privilege in the House of Commons, and the ministry was so smitten with weakness and confusion as to be unable to resist the current of arbitrary policy, and not many of them were even willing to resist it. The unconstitutional persecution of Wilkes was followed by the fatal recourse to new plans for raising taxes in the American colonies. These two points made the rallying ground of the new Whig opposition. Burke helped to smooth matters for a practical union between the Rockingham party and the powerful triumvirate, composed of Chatham, whose understanding had recovered from its late disorder, and of his brothers-in-law, Lord Temple and George Grenville. He was active in urging petitions from the freeholders of the counties, protesting against the unconstitutional invasion of the right of election. And he added a durable masterpiece to political literature in a pamphlet which he called *Thoughts on the Cause of the Present Discontents* (1770). The immediate object of this excellent piece was to hold

## POLITICAL GENIUS

up the court scheme of weak, divided and dependent administrations in the light of its real purpose and design; to describe the distempers which had been engendered in parliament by the growth of royal influence and the faction of the king's friends; to show that the newly formed Whig party had combined for truly public ends, and was no mere family knot like the Grenvilles and the Bedfords; and, finally, to press for the hearty concurrence both of public men and of the nation at large in combining against "a faction ruling by the private instructions of a court against the general sense of the people." The pamphlet was disliked by Chatham on the one hand, on no reasonable grounds that we can discover; it was denounced by the extreme popular party of the Bill of Rights, on the other hand, for its moderation and conservatism. In truth, there is as strong a vein of conservative feeling in the pamphlet of 1770 as in the more resplendent pamphlet of 1790. "Our constitution," he said, "stands on a nice equipoise, with steep precipices and deep waters upon all sides of it. In removing it from a dangerous leaning towards one side, there may be a risk of oversetting it on the other. Every project of a material change in a government so complicated as ours is a matter full of difficulties; in which a considerate man will not be too ready to decide, a prudent man too ready to undertake, or an honest man too ready to promise." Neither now nor ever had Burke any other real conception of a polity for England than government by the territorial aristocracy in the interests of the nation at large, and especially in the interest of commerce, to the vital importance of which in our economy he was always keenly and wisely alive. The policy of George III., and the support which it found among men who were weary of Whig factions, disturbed this scheme, and therefore Burke denounced both the court policy and the court party with all his heart and all his strength.

Eloquence and good sense, however, were impotent in the face of such forces as were at this time arrayed against a government at once strong and liberal. The court was confident that a union between Chatham and the Rockinghams was impossible. The union was in fact hindered by the waywardness and the absurd pretences of Chatham, and the want of force in Lord Rockingham. In the nation at large, the late violent ferment had been followed by as remarkable a deadness and vapidness, and Burke himself had to admit a year or two later that any remarkable robbery at Hounslow Heath would make more conversation than all the disturbances of America. The duke of Grafton went out, and Lord North became the head of a government, which lasted twelve years (1770-82), and brought about more than all the disasters that Burke had foretold as the inevitable issue of the royal policy. For the first six years of this lamentable period Burke was actively employed in stimulating, informing and guiding the patrician chiefs of his party. "Indeed, Burke," said the duke of Richmond, "you have more merit than any man in keeping us together." They were well-meaning and patriotic men, but it was not always easy to get them to prefer politics to fox-hunting. When he reached his lodgings at night after a day in the city or a skirmish in the House of Commons, Burke used to find a note from the duke of Richmond or the marquess of Rockingham, praying him to draw a protest to be entered on the journals of the Lords, and in fact he drew all the principal protests of his party between 1767 and 1782. The accession of Charles James Fox to the Whig party, which took place at this time, and was so important an event in its history, was mainly due to the teaching and influence of Burke. In the House of Commons his industry was almost excessive. He was taxed with speaking too often, and with being too forward. And he was mortified by a more serious charge than murmurs about superfluity of zeal. Men said and said again that he was Junius. His very proper unwillingness to stoop to deny an accusation, that would have been so disgraceful if it had been true, made ill-natured and silly people the more convinced that it was not wholly false. But whatever the London world may have thought of him, Burke's energy and devotion of character impressed the better minds in the country. In 1774 he received the great distinction of being chosen as one of its representatives by Bristol, then the second town in the kingdom.

In the events which ended in the emancipation of the American colonies from the monarchy, Burke's political genius shone with an effulgence that was worthy of the great affairs over which it shed so magnificent an illumination. His speeches are almost the one monument of the struggle on which a lover of English greatness can look back with pride and a sense of worthiness, such as a churchman feels when he reads Bossuet, or an Anglican when he turns over the pages of Taylor or of Hooker. Burke's attitude in these high transactions is really more impressive than Chatham's, because he was far less theatrical than Chatham; and while he was no less nobly passionate for freedom and justice, in his passion was fused the most strenuous political argumentation and sterling reason of state. On the other hand he was wholly free from that quality which he ascribed to Lord George Sackville, a man "apt to take a sort of undecided, equivocal, narrow ground, that evades the substantial merits of the question, and puts the whole upon some temporary, local, accidental or personal consideration." He rose to the full height of that great argument. Burke here and everywhere else displayed the rare art of filling his subject with generalities, and yet never intruding commonplaces. No publicist who deals as largely in general propositions has ever been as free from truisms; no one has ever treated great themes with so much elevation, and yet been so wholly secured against the pitfalls of emptiness and the vague. And it is instructive to compare the foundation of all his pleas for the colonists with that on which they erected their own theoretic declaration of independence. The American leaders were impregnated with the metaphysical ideas of rights which had come to them from the rising revolutionary school in France. Burke no more adopted the doctrines of Jefferson in 1776 than he adopted the doctrines of Robespierre in 1793. He says nothing about men being born free and equal, and on the other hand he never denies the position of the court and the country at large, that the home legislature, being sovereign, had the right to tax the colonies. What he does say is that the exercise of such a right was not practicable; that if it were practicable, it was inexpedient; and that, even if this had not been inexpedient, yet, after the colonies had taken to arms, to crush their resistance by military force would not be more disastrous to them than it would be unfortunate for the ancient liberties of Great Britain. Into abstract discussion he would not enter. "Show the thing you contend for to be reason; show it to be common sense; show it to be the means of attaining some useful end." "The question with me is not whether you have a right to render your people miserable, but whether it is not your interest to make them happy." There is no difference in social spirit and doctrine between his protests against the maxims of the English common people as to the colonists, and his protests against the maxims of the French common people as to the court and the nobles; and it is impossible to find a single principle either asserted or implied in the speeches on the American revolution which was afterwards repudiated in the writings on the revolution in France.

It is one of the signs of Burke's singular and varied eminence that hardly any two people agree precisely which of his works to mark as the masterpiece. Every speech or tract that he composed on a great subject becomes, as we read it, the rival of every other. But the *Speech on Conciliation* (1775) has, perhaps, been more universally admired than any of his other productions, partly because its maxims are of a simpler and less disputable kind than those which adorn the pieces on France, and partly because it is most strongly characterized by that deep ethical quality which is the prime secret of Burke's great style and literary mastery. In this speech, moreover, and in the only less powerful one of the preceding year upon American taxation, as well as in the *Letter to the Sheriffs of Bristol*, in 1777, we see the all-important truth conspicuously illustrated that half of his eloquence always comes of the thoroughness with which he gets up his case. No eminent man has ever done more than Burke to justify the definition of genius as the consummation of the faculty of taking pains. Labour incessant and intense, if it was not the source, was at least an inseparable condition of his power. And magnificent rhetorician

though he was his labour was given less to his diction than to the facts; his heart was less in the form than the matter. It is true that his manuscripts were blotted and smeared, and that he made so many alterations in the proofs that the printer found it worth while to have the whole set up in type afresh. But there is no polish in his style, as in that of Junius for example, though there is something a thousand times better than polish. "Why will you not allow yourself to be persuaded," said Francis after reading the *Reflections*, "that polish is material to preservation?" Burke always accepted the rebuke, and flung himself into vindication of the sense, substance and veracity of what he had written. His writing is magnificent, because he knew so much, thought so comprehensively, and felt so strongly.

The succession of failures in America, culminating in Cornwallis's surrender at Yorktown in Oct., 1781, wearied the nation, and at length the persistent and powerful attacks of the opposition began to tell. "At this time," wrote Burke, in words of manly self-assertion, 13 years afterwards, "having a momentary lead (1780-82), so aided and so encouraged, and as a feeble instrument in a mighty hand—I do not say I saved my country—I am sure I did my country important service. There were few indeed at that time that did not acknowledge it. It was but one voice, that no man in the kingdom better deserved an honourable provision should be made for him." In the spring of 1782 Lord North resigned. It seemed as if the court system which Burke had been denouncing for a dozen years was now finally broken, and as if the party which he had been the chief instrument in instructing, directing and keeping together must now inevitably possess power for many years to come. Yet in a few months the whole fabric had fallen, and the Whigs were thrown into opposition for the rest of the century. The story cannot be omitted in the most summary account of Burke's life. Lord Rockingham came into office on the fall of North. Burke was rewarded for services beyond price by being made paymaster of the forces, with the rank of a privy councillor. He had lost his seat for Bristol two years before, in consequence of his courageous advocacy of a measure of tolerance for the Catholics, and his still more courageous exposure of the enormities of the commercial policy of England towards Ireland. He sat during the rest of his parliamentary life (to 1794) for Malton, a pocket borough first of Lord Rockingham's, then of Lord Fitzwilliam's. Burke's first tenure of office was very brief. He had brought forward in 1780 a comprehensive scheme of economical reform, with the design of limiting the resources of jobbery and corruption which the crown was able to use to strengthen its own sinister influence in parliament. Administrative reform was, next to peace with the colonies, the part of the scheme of the new ministry to which the king most warmly objected. It was carried out with greater moderation than had been foreshadowed in opposition. But at any rate Burke's own office was not spared. While Charles Fox's father was at the pay-office (1765-78) he realized, as the interest of the cash balances which he was allowed to retain in his hands, nearly a quarter of a million of money. When Burke came to this post the salary was settled at £4,000 a year. He did not long enjoy the income. In July 1782 Lord Rockingham died; Lord Shelburne took his place; Fox, who inherited from his father a belief in Lord Shelburne's duplicity, which his own experience of him as a colleague during the last three months had made stronger, declined to serve under him. Burke, though he had not encouraged Fox to take this step, still, with his usual loyalty, followed him from office. This may have been the thing to do if their distrust of Shelburne was incurable, but the next step, coalition with Lord North against him, was not only a political blunder, but a shock to party morality, which brought speedy retribution. Either they had been wrong, and violently wrong, for a dozen years, or else Lord North was the guiltiest political instrument since Strafford. Burke attempted to defend the alliance on the ground of the substantial agreement between Fox and North in public aims. The defence is wholly untenable. The Rockingham Whigs were as substantially in agreement on public affairs with the Shelburne Whigs as they were with Lord North. The movement was one of the worst in the history of

English party. It served its immediate purpose, however, for Lord Shelburne found himself (Feb. 24, 1783) too weak to carry on the government, and was succeeded by the members of the coalition, with the duke of Portland for prime minister (April 2, 1783). Burke went back to his old post at the pay-office and was soon engaged in framing and drawing the famous India Bill. This was long supposed to be the work of Fox, who was politically responsible for it. We may be sure that neither he nor Burke would have devised any government for India which they did not honestly believe to be for the advantage both of that country and of England. But it cannot be disguised that Burke had thoroughly persuaded himself that it was indispensable in the interests of English freedom to strengthen the party hostile to the court. As we have already said, dread of the peril to the constitution from the new aims of George III. was the main inspiration of Burke's political action in home affairs for the best part of his political life. The India Bill strengthened the anti-court party by transferring the government of India to seven persons named in the bill, and neither appointed nor removable by the crown. In other words, the bill gave the government to a board chosen directly by the House of Commons; and it had the incidental advantage of conferring on the ministerial party patronage valued at £300,000 a year, which would remain for a fixed term of years out of reach of the king. In a word, judging the India Bill from a party point of view, we see that Burke was now completing the aim of his project of economic reform. That measure had weakened the influence of the crown by limiting its patronage. The measure for India weakened the influence of the crown by giving a mass of patronage to the party which the king hated. But this was not to be. The India Bill was thrown out by means of a royal intrigue in the Lords, and the ministers were instantly dismissed (Dec. 18, 1783). Young William Pitt, then only in his 25th year, had been chancellor of the exchequer in Lord Shelburne's short ministry, and had refused to enter the coalition government from an honourable repugnance to join Lord North. He was now made prime minister. The country in the election of the next year ratified the king's judgment against the Portland combination; and the hopes which Burke had cherished for a political lifetime were irretrievably ruined.

#### THE IMPEACHMENT OF HASTINGS

The six years that followed the great rout of the orthodox Whigs were years of repose for the country, but it was now that Burke engaged in the most laborious and formidable enterprise of his life, the impeachment of Warren Hastings for high crimes and misdemeanours in his government of India. His interest in that country was of old date. It arose partly from the fact of William Burke's residence there, partly from his friendship with Philip Francis, but most of all, we suspect, from the effect which he observed Indian influence to have in demoralizing the House of Commons. "Take my advice for once in your life," Francis wrote to Shee; "lay aside 40,000 rupees for a seat in parliament: in this country that alone makes all the difference between somebody and nobody." The relations, moreover, between the East India Company and the government were of the most important kind, and occupied Burke's closest attention from the beginning of the American war down to his own India Bill and that of Pitt and Dundas. In Feb. 1785 he delivered one of the most famous of all his speeches, that on the nabob of Arcot's debts. The real point of this superb declamation was Burke's conviction that ministers supported the claims of the fraudulent creditors in order to secure the corrupt advantages of a sinister parliamentary interest. His proceedings against Hastings had a deeper spring. The story of Hastings's crimes, as Macaulay says, made the blood of Burke boil in his veins. He had a native abhorrence of cruelty, of injustice, of disorder, of oppression, of tyranny, and all these things in all their degrees marked Hastings's course in India. They were, moreover, concentrated in individual cases, which exercised Burke's passionate imagination to its profoundest depths, and raised it to such a glow of fiery intensity as has never been rivalled in our history. For it endured for 14 years, and was just as burning and as terrible when Hastings was acquitted in 1795, as

in the select committee of 1781 when Hastings's enormities were first revealed. "If I were to call for a reward," wrote Burke, "it would be for the services in which for 14 years, without intermission, I showed the most industry and had the least success, I mean in the affairs of India; they are those on which I value myself the most; most for the importance; most for the labour; most for the judgment; most for constancy and perseverance in the pursuit." Sheridan's speech in the House of Commons upon the charge relative to the begums of Oude probably excelled anything that Burke achieved, as a dazzling performance abounding in the most surprising literary and rhetorical effects. But neither Sheridan nor Fox was capable of that sustained and overflowing indignation at outraged justice and oppressed humanity, that consuming moral fire, which burst forth again and again from the chief manager of the impeachment, with such scorching might as drove even the cool and intrepid Hastings beyond all self-control, and made him cry out with protests and exclamations like a criminal writhing under the scourge. Burke, no doubt, in the course of that unparalleled trial showed some prejudice; made some minor overstatements of his case; used many intemperances; and suffered himself to be provoked into expressions of heat and impatience by the cabals of the defendant and his party, and the intolerable incompetence of the tribunal. It is one of the inscrutable perplexities of human affairs, that in the logic of practical life, in order to reach conclusions that cover enough for truth, we are constantly driven to premises that cover too much, and that in order to secure their right weight to justice and reason good men are forced to fling the two-edged sword of passion into the same scale. But these excuses were mere trifles, and well deserve to be forgiven, when we think that though the offender was in form acquitted, yet Burke succeeded in these 14 years of laborious effort in laying the foundations once for all of a moral, just, philanthropic and responsible public opinion in England with reference to India, and in doing so performed perhaps the most magnificent service that any statesman has ever had it in his power to render to humanity.

Burke's first decisive step against Hastings was a motion for papers in the spring of 1786; the thanks of the House of Commons to the managers of the impeachment were voted in the summer of 1794. But in those eight years some of the most astonishing events in history had changed the political face of Europe. Burke was more than 60 years old when the states-general met at Versailles in the spring of 1789. He had taken a prominent part on the side of freedom in the revolution which stripped England of her empire in the West. He had taken a prominent part on the side of justice, humanity and order in dealing with the revolution which had brought to England new empire in the East. The same vehement passion for freedom, justice, humanity and order was roused in him at a very early stage of the third great revolution in his history—the revolution which overthrew the old monarchy in France. From the first Burke looked on the events of 1789 with doubt and misgiving. He had been in France in 1773, where he had not only the famous vision of Marie Antoinette at Versailles, "glittering like the morning star, full of life, and splendour and joy," but had also supped and discussed with some of the destroyers, the encyclopaedists, "the sophisters, economists and calculators." His first speech on his return to England was a warning (March 17, 1773) that the props of good government were beginning to fail under the systematic attacks of unbelievers, and that principles were being propagated that would not leave to civil society any stability. The apprehension never died out in his mind; and when he knew that the principles and abstractions, the un-English dialect and destructive dialectic, of his former acquaintances were predominant in the National Assembly, his suspicion that the movement would end in disastrous miscarriage waxed into certainty.

#### ATTITUDE TO FRENCH REVOLUTION

The scene grew still more sinister in his eyes after the march of the mob from Paris to Versailles in October, and the violent transport of the king and queen from Versailles to Paris. The same hatred of lawlessness and violence which fired him with a

divine rage against the Indian malefactors was aroused by the violence and lawlessness of the Parisian insurgents. The same disgust for abstractions and naked doctrines of right that had stirred him against the pretensions of the British parliament in 1774 and 1776, was revived in as lively a degree by political conceptions which he judged to be identical in the French assembly of 1789. And this anger and disgust were exasperated by the dread with which certain proceedings in England had inspired him, that the aims, principles, methods and language which he so misdoubted or abhorred in France were likely to infect the people of Great Britain.

In November 1790 the town, which had long been eagerly expecting a manifesto from Burke's pen, was electrified by the *Reflections on the Revolution in France, and on the proceedings in certain societies in London relative to that event*. The generous Windham made an entry in his diary of his reception of the new book. "What shall be said," he added, "of the state of things, when it is remembered that the writer is a man decried, persecuted and proscribed; not being much valued even by his own party, and by half the nation considered as little better than an ingenious madman?" But the writer now ceased to be decried, persecuted and proscribed, and his book was seized as the expression of that new current of opinion in Europe which the more recent events of the Revolution had slowly set flowing. Its vogue was instant and enormous. Eleven editions were exhausted in little more than a year, and there is probably not much exaggeration in the estimate that 30,000 copies were sold before Burke's death seven years afterwards. George III. was extravagantly delighted; Stanislaus of Poland sent Burke words of thanks and high glorification and a gold medal. Catherine of Russia, the friend of Voltaire and the benefactress of Diderot, sent her congratulations to the man who denounced French philosophers as miscreants and wretches. "One wonders," Romilly said, by and by, "that Burke is not ashamed at such success." Mackintosh replied to him temperately in the *Vindiciae Gallicae*, and Thomas Paine replied to him less temperately but far more trenchantly and more shrewdly in the *Rights of Man*. Arthur Young, with whom he had corresponded years before on the mysteries of deep ploughing and fattening hogs, added a cogent polemical chapter to that ever admirable work, in which he showed that he knew as much more than Burke about the old system of France as he knew more than Burke about soils and roots. Philip Francis, to whom he had shown the proof-sheets, had tried to dissuade Burke from publishing his performance. The passage about Marie Antoinette, which has since become a stock piece in books of recitation, seemed to Francis a mere piece of foppery; for was she not a Messalina and a jade? "I know nothing of your story of Messalina," answered Burke; "am I obliged to prove judicially the virtues of all those I shall see suffering every kind of wrong and contumely and risk of life, before I endeavour to interest others in their sufferings? . . . Are not high rank, great splendour of descent, great personal elegance and outward accomplishments ingredients of moment in forming the interest we take in the misfortunes of men? . . . I tell you again that the recollection of the manner in which I saw the queen of France in 1774, and the contrast between that brilliancy, splendour and beauty, with the prostrate homage of a nation to her, and the abominable scene of 1789 which I was describing, *did* draw tears from me and wetted my paper. These tears came again into my eyes almost as often as I looked at the description,—they may again. You do not believe this fact, nor that these are my real feelings; but that the whole is affected, or as you express it, downright foppery. My friend, I tell you it is truth; and that it is true and will be truth when you and I are no more; and will exist as long as men with their natural feelings shall exist" (*Corr.* iii. 139).

Burke's conservatism was, as such a passage as this may illustrate, the result partly of strong imaginative associations clustering round the more imposing symbols of social continuity, partly of a sort of corresponding conviction in his reason that there are certain permanent elements of human nature out of which the European order had risen and which that order satisfied, and

of whose immense merits, as of its mighty strength, the revolutionary party in France were most fatally ignorant. When Romilly saw Diderot in 1783, the great encyclopaedic chief assured him that submission to kings and belief in God would be at an end all over the world in a very few years. When Condorcet described the Tenth Epoch in the long development of human progress, he was sure not only that fulness of light and perfection of happiness would come to the sons of men, but that they were coming with all speed. Only those who know the incredible rashness of the revolutionary doctrine in the mouths of its most powerful professors at that time; only those who know their absorption in ends and their inconsiderateness about means, can feel how profoundly right Burke was in all this part of his contention. Napoleon, who had begun life as a disciple of Rousseau, confirmed the wisdom of the philosophy of Burke when he came to make the Concordat. That measure was in one sense the outcome of a mere sinister expediency, but that such a measure was expedient at all sufficed to prove that Burke's view of the present possibilities of social change was right, and the view of the Rousseauites and too sanguine Perfectibilitarians wrong. As we have seen, Burke's very first piece, the satire on Bolingbroke, sprang from his conviction that merely rationalistic or destructive criticism, applied to the vast complexities of man in the social union, is either mischievous or futile, and mischievous exactly in proportion as it is not futile.

To discuss Burke's writings on the Revolution would be to write first a volume upon the abstract theory of society, and then a second volume on the history of France. But we may make one or two further remarks. One of the most common charges against Burke was that he allowed his imagination and pity to be touched only by the sorrows of kings and queens, and forgot the thousands of oppressed and famine-stricken toilers of the land. "No tears are shed for nations," cried Francis, whose sympathy for the Revolution was as passionate as Burke's execration of it. "When the provinces are scourged to the bone by a mercenary and merciless military power, and every drop of its blood and substance extorted from it by the edicts of a royal council, the case seems very tolerable to those who are not involved in it. When thousands after thousands are dragooned out of their country for the sake of their religion, or sent to row in the galleys for selling salt against law—when the liberty of every individual is at the mercy of every prostitute, pimp or parasite that has access to power or any of its basest substitutes—my mind, I own, is not at once prepared to be satisfied with gentle palliatives for such disorders" (*Francis to Burke*, Nov. 3, 1790). This is a very terse way of putting a crucial objection to Burke's whole view of French affairs in 1789. His answer was tolerably simple. The Revolution, though it had made an end of the Bastille, did not bring the only real practical liberty; that is to say, the liberty which comes with settled courts of justice, administering settled laws, undisturbed by popular fury, independent of everything but law, and with a clear law for their direction. The people, he contended, were no worse off under the old monarchy than they will be in the long run under assemblies that are bound by the necessity of feeding one part of the community at the grievous charge of other parts, as necessitous as those who are so fed; that are obliged to flatter those who have their lives at their disposal by tolerating acts of doubtful influence on commerce and agriculture, and for the sake of precarious relief to sow the seeds of lasting want; that will be driven to be the instruments of the violence of others from a sense of their own weakness, and, by want of authority to assess equal and proportional charges upon all, will be compelled to lay a strong hand upon the possessions of a part. As against the moderate section of the Constituent Assembly this was just.

One secret of Burke's views of the Revolution was the contempt which he had conceived for the popular leaders in the earlier stages of the movement. In spite of much excellence of intention, much heroism, much energy, it is hardly to be denied that the leaders whom that movement brought to the surface were almost without exception men of the poorest political capacity. Danton, no doubt, was abler than most of the others, yet

the timidity or temerity with which he allowed himself to be vanquished by Robespierre showed that even he was not a man of commanding quality. The spectacle of men so rash, and so incapable of controlling the forces which they seemed to have presumptuously summoned, excited in Burke both indignation and contempt. And the leaders of the Constituent who came first on the stage, and hoped to make a revolution with rose-water, and hardly realized any more than Burke did how rotten was the structure which they had undertaken to build up, almost deserved his contempt, even if, as is certainly true, they did not deserve his indignation. It was only by revolutionary methods, which are in their essence and for a time as arbitrary as despotic methods, that the knot could be cut. Burke's vital error was his inability to see that a root and branch revolution was, under the conditions, inevitable. His cardinal position, from which he deduced so many important conclusions, namely, that the parts and organs of the old constitution of France were sound, and only needed moderate invigoration, is absolutely mistaken and untenable. There was not a single chamber in the old fabric that was not crumbling and tottering. The court was frivolous, vacillating, stone deaf and stone blind; the gentry were amiable, but distinctly bent to the very last on holding to their privileges, and they were wholly devoid both of the political experience that only comes of practical responsibility for public affairs, and of the political sagacity that only comes of political experience. The parliaments or tribunals were nests of faction and of the deepest social incompetence. The very sword of the state broke short in the king's hand. If the king or queen could either have had the political genius of Frederick the Great, or could have had the good fortune to find a minister with that genius, and the good sense and good faith to trust and stand by him against mobs of aristocrats and mobs of democrats; if the army had been sound and the states-general had been convoked at Bourges or Tours instead of at Paris, then the type of French monarchy and French society might have been modernized without convulsion. But none of these conditions existed.

When he dealt with the affairs of India, Burke passed over the circumstances of British acquisition of power in that continent. "There is a sacred veil to be drawn over the beginnings of all government," he said. "The first step to empire is revolution, by which power is conferred; the next is good laws, good order, good institutions, to give that power stability." Exactly on this broad principle of political force, revolution was the first step to the assumption by the French people of their own government. Granted that the Revolution was inevitable and indispensable, how was the nation to make the best of it? And how were surrounding nations to make the best of it? This was the true point of view. But Burke never placed himself at such a point. He never conceded the postulate, because, though he knew France better than anybody in England except Arthur Young, he did not know her condition well enough. "Alas!" he said, "they little know how many a weary step is to be taken before they can form themselves into a mass which has a true political personality."

#### THE BREAK WITH FOX

Burke's view of French affairs, however consistent with all his former political conceptions, put an end to more than one of his old political friendships. He had never been popular in the House of Commons, and the vehemence, sometimes amounting to fury, which he had shown in the debates on the India Bill, on the regency, on the impeachment of Hastings, had made him unpopular even among men on his own side. In May 1789—that memorable month of May in which the states-general marched in impressive array to hear a sermon at the church of Notre Dame at Versailles—a vote of censure had actually been passed on him in the House of Commons for a too severe expression used against Hastings. Fox, who led the party, and Sheridan, who led Fox, were the intimates of the prince of Wales; and Burke would have been as much out of place in that circle of gamblers and profligates as Milton would have been out of place in the court of the Restoration. The prince, as somebody said, was like his father in having closets within cabinets and cupboards within

closets. When the debates on the regency were at their height we have Burke's word that he was not admitted to the private counsels of the party. Though Fox and he were on friendly terms in society, yet Burke admits that for a considerable period before 1790 there had been between them "distance, coolness and want of confidence, if not total alienation on his part." The younger Whigs had begun to press for shorter parliaments, for the ballot, for redistribution of political power. Burke had never looked with any favour on these projects. His experience of the sentiment of the populace in the two greatest concerns of his life—American affairs and Indian affairs—had not been likely to prepossess him in favour of the popular voice as the voice of superior political wisdom. He did not absolutely object to some remedy in the state of representation (*Corr.* ii. 387), still he vigorously resisted such proposals as the duke of Richmond's in 1780 for manhood suffrage. The general ground was this:—"The machine itself is well enough to answer any good purpose, provided the materials were sound. But what signifies the arrangement of rottenness?"

Bad as the parliaments of George III. were, they contained their full share of eminent and capable men, and, what is more, their very defects were the exact counterparts of what we now look back upon as the prevailing stupidity in the country. What Burke valued was good government. His *Report on the Causes of the Duration of Mr. Hastings's Trial* shows how wide and sound were his views of law reform. His *Thoughts on Scarcity* attest his enlightenment on the central necessities of trade and manufacture, and even furnished arguments to Cobden 50 years afterwards. Pitt's parliaments were competent to discuss and willing to pass, all measures for which the average political intelligence of the country was ripe. Burke did not believe that altered machinery was at that time needed to improve the quality of legislation. If wiser legislation followed the great reform of 1832, Burke would have said that this was because the political intelligence of the country had improved.

Though averse at all times to taking up parliamentary reform, he thought all such projects downright crimes in the agitation of 1791-92. This was the view taken by Burke, but it was not the view of Fox, nor of Sheridan, nor of Francis, nor of many others of his party, and difference of opinion here was naturally followed by difference of opinion upon affairs in France. Fox, Grey, Windham, Sheridan, Francis, Lord Fitzwilliam, and most of the other Whig leaders, welcomed the Revolution in France. And so did Pitt, too, for some time. "How much the greatest event it is that ever happened in the world," cried Fox, with the exaggeration of a man ready to dance the carmagnole, "and how much the best." The dissension between a man who felt so passionately as Burke, and a man who spoke so impulsively as Charles Fox, lay in the very nature of things. Between Sheridan and Burke there was an open breach in the House of Commons upon the Revolution so early as February 1790, and Sheridan's influence with Fox was strong. This divergence of opinion destroyed all the elation that Burke might well have felt at his compliments from kings, his gold medals, his twelve editions. But he was too fiercely in earnest in his horror of Jacobinism to allow mere party associations to guide him. In May 1791 the thundercloud burst, and a public rupture between Burke and Fox took place in the House of Commons.

The scene is famous in English parliamentary annals. The minister had introduced a measure for the division of the province of Canada and for the establishment of a local legislature in each division. Fox in the course of debate went out of his way to laud the Revolution, and to sneer at some of the most effective passages in the *Reflections*. Burke was not present, but he announced his determination to reply. On the day when the Quebec Bill was to come on again, Fox called upon Burke, and the pair walked together from Burke's house in Duke Street down to Westminster. The Quebec Bill was recommitted, and Burke at once rose and soon began to talk his usual language against the Revolution, the rights of man, and Jacobinism whether English or French. There was a call to order. Fox, who was as sharp and intolerant in the House as he was amiable out of it, interposed

with some words of contemptuous irony. Pitt, Grey, Lord Sheffield, all plunged into confused and angry debate as to whether the French Revolution was a good thing, and whether the French Revolution, good or bad, had anything to do with the Quebec Bill. At length Fox, in seconding a motion for confining the debate to its proper subject, burst into the fatal question beyond the subject, taxing Burke with inconsistency, and taunting him with having forgotten that ever-admirable saying of his own about the insurgent colonists, that he did not know how to draw an indictment against a whole nation. Burke replied in tones of firm self-repression; complained of the attack that had been made upon him; reviewed Fox's charges of inconsistency; enumerated the points on which they had disagreed, and remarked that such disagreements had never broken their friendship. But whatever the risk of enmity, and however bitter the loss of friendship, he would never cease from the warning to flee from the French constitution. "But there is no loss of friends," said Fox in an eager undertone. "Yes," said Burke, "there is a loss of friends. I know the penalty of my conduct. I have done my duty at the price of my friend—our friendship is at an end." Fox rose, but was so overcome that for some moments he could not speak. At length, his eyes streaming with tears, and in a broken voice, he deplored the breach of a 20 years' friendship on a political question. Burke was inexorable. To him the political question was so vivid, so real, so intense, as to make all personal sentiment no more than dust in the balance. Burke confronted Jacobinism with the relentlessness of a Jacobin. The rupture was never healed, and Fox and he had no relations with one another henceforth beyond such formal interviews as took place in the manager's box in Westminster Hall in connection with the impeachment.

A few months afterwards Burke published the *Appeal from the New to the Old Whigs*, a grave, calm and most cogent vindication of the perfect consistency of his criticisms upon the English Revolution in 1688 and upon the French Revolution of 1789, with the doctrines of the great Whigs who conducted and afterwards defended in Anne's reign the transfer of the crown from James to William and Mary. The *Appeal* was justly accepted as a satisfactory performance for the purpose with which it was written. Events, however, were doing more than words could do to confirm the public opinion of Burke's sagacity and foresight. He had always divined by the instinct of hatred that the French moderates must gradually be swept away by the Jacobins, and now it was all coming true. The humiliation of the king and queen after their capture at Varennes; the compulsory acceptance of the constitution; the plain incompetence of the new Legislative Assembly; the growing violence of the Parisian mob, and the ascendancy of the Jacobins at the Common Hall; the fierce day of June 20, 1792, when the mob flooded the Tuileries, and the bloodier day of Aug. 10, when the Swiss Guard was massacred and the royal family flung into prison; the murders in the prisons in September; the trial and execution of the king in Jan. 1793; the proscription of the Girondins in June, the execution of the queen in October—if we realize the impression likely to be made upon the sober and homely English imagination by such a heightening of horror by horror, we may easily understand how people came to listen to Burke's voice as the voice of inspiration, and to look on his burning anger as the holy fervour of a prophet of the Lord.

#### BURKE AND PITT

Fox still held to his old opinions as stoutly as he could, and condemned and opposed the war which England had declared against the French republic. Burke, who was profoundly incapable of the meanness of letting personal estrangement blind his eyes to what was best for the commonwealth, kept hoping against hope that each new trait of excess in France would at length bring the great Whig leader to a better mind. He used to declaim by the hour in the conclaves at Burlington House upon the necessity of securing Fox; upon the strength which his genius would lend to the administration in its task of grappling with the sanguinary giant; upon the impossibility, at least, of doing either with him or without him. Fox's most important political friends

who had long wavered, at length, to Burke's great satisfaction, went over to the side of the government. In July 1794 the duke of Portland, Lord Fitzwilliam, Windham and Grenville took office under Pitt. Fox was left with a minority which was satirically said not to have been more than enough to fill a hackney coach. "That is a calumny," said one of the party; "we should have filled two." The war was prosecuted with the aid of both the great parliamentary parties of the country, and with the approval of the great bulk of the nation. Perhaps the one man in England who in his heart approved of it less than any other was William Pitt. The difference between Pitt and Burke was nearly as great as that between Burke and Fox. Burke would be content with nothing short of a crusade against France, and war to the death with her rulers. "I cannot persuade myself," he said, "that this war bears any the least resemblance to any that has ever existed in the world. I cannot persuade myself that any examples or any reasonings drawn from other wars and other politics are at all applicable to it" (*Corr.* iv. 219). Pitt, on the other hand, as Lord Russell truly says, treated Robespierre and Carnot as he would have treated other French rulers, whose ambition was to be resisted, and whose interference in the affairs of other nations was to be checked. And he entered upon the matter in the spirit of a man of business, by sending ships to seize some islands belonging to France in the West Indies, so as to make certain of repayment of the expenses of the war.

In the summer of 1794 Burke was struck to the ground by a blow to his deepest affection in life, and he never recovered from it. His whole soul was wrapped up in his only son, of whose abilities he had the most extravagant estimate and hope. All the evidence goes to show that Richard Burke was one of the most presumptuous and empty-headed of human beings. "He is the most impudent and opiniative fellow I ever knew," said Wolfe Tone. Gilbert Elliot, a very different man, gives the same account. "Burke," he says, describing a dinner party at Lord Fitzwilliam's in 1793, "has now got such a train after him as would sink anybody but himself: his son who is quite *nauseated* by all mankind; his brother, who is liked better than his son, but is rather oppressive with animal spirits and brogue; and his cousin, William Burke, who is just returned unexpectedly from India, as much ruined as when he went years ago, and who is a fresh charge on any prospects of power Burke may ever have. Mrs. Burke has in her train Miss French [Burke's niece], the most perfect *she Paddy* that ever was caught. Notwithstanding these disadvantages Burke is in himself a sort of power in the state. It is not too much to say that he is a sort of power in Europe, though totally without any of those means or the smallest share in them which give or maintain power in other men." Burke accepted the position of a power in Europe seriously. Though no man was ever more free from anything like the egoism of the intellectual coxcomb, yet he abounded in that active self-confidence and self-assertion which is natural in men who are conscious of great powers, and strenuous in promoting great causes. In the summer of 1791 he despatched his son to Coblenz to give advice to the royalist exiles, then under the direction of Calonne, and to report to him at Beaconsfield their disposition and prospects. Richard Burke was received with many compliments, but of course nothing came of his mission, and the only impression that remains with the reader of his prolix story is his tale of the two royal brothers, who afterwards became Louis XVIII. and Charles X., meeting after some parting, and embracing one another with many tears on board a boat in the middle of the Rhine, while some of the courtiers raised a cry of "Long live the king!"—the king who had a few weeks before been carried back in triumph to his capital with Mayor Pétion in his coach. When we think of the pass to which things had come in Paris by this time, and of the unappeasable ferment that boiled round the court, there is a certain touch of the ludicrous in the notion of poor Richard Burke writing to Louis XVI. a letter of wise advice how to comport himself.

At the end of the same year, with the approval of his father he started for Ireland as the adviser of the Catholic Association. He made a wretched emissary, and there was no limit to his arro-

gance, noisiness and indiscretion. The Irish agitators were glad to give him 2,000 guineas and to send him home. The mission is associated with a more important thing, his father's *Letters to Sir Hercules Langrishe*, advocating the admission of the Irish Catholics to the franchise. This short piece abounds richly in maxims of moral and political prudence. And Burke exhibited considerable courage in writing it; for many of its maxims seem to involve a contradiction, first, to the principles on which he withstood the movement in France, and second, to his attitude upon the subject of parliamentary reform. The contradiction is in fact only superficial. Burke was not the man to fall unawares into a trap of this kind. His defence of Catholic relief—and it had been the conviction of a lifetime—was very properly founded on propositions which were true of Ireland, and were true neither of France nor of the quality of parliamentary representation in England. Yet Burke threw such breadth and generality over all he wrote that even these propositions, relative as they were, form a short manual of statesmanship.

#### END OF PARLIAMENTARY LIFE

At the close of the session of 1794 the impeachment of Hastings had come to an end, and Burke bade farewell to parliament. Richard Burke was elected in his father's place at Malton. The king was bent on making the champion of the old order of Europe a peer. His title was to be Lord Beaconsfield, and it was designed to annex to the title an income for three lives. The patent was being made ready, when all was arrested by the sudden death of the son who was to Burke more than life. The old man's grief was agonizing and inconsolable. "The storm has gone over me," he wrote in words which are well known, but which can hardly be repeated too often for any who have an ear for the cadences of noble and pathetic speech "The storm has gone over me, and I lie like one of those old oaks which the late hurricane has scattered about me. I am stripped of all my honours; I am torn up by the roots and lie prostrate on the earth . . . I am alone. I have none to meet my enemies in the gate, . . . I live in an inverted order. They who ought to have succeeded me have gone before me. They who should have been to me as posterity are in the place of ancestors."

A pension of £2,500 was all that Burke could now be persuaded to accept. The duke of Bedford and Lord Lauderdale made some remarks in parliament upon this paltry reward to a man who, in conducting a great trial on the public behalf, had worked harder for nearly ten years than any minister in any cabinet of the reign. But it was not yet safe to kick up heels in face of the dying lion. The vileness of such criticism was punished, as it deserved to be, in the *Letter to a Noble Lord* (1796), in which Burke showed the usual art of all his compositions in shaking aside the insignificances of a subject. He turned mere personal defence and retaliation into an occasion for a lofty enforcement of constitutional principles, and this, too, with a relevancy and pertinence of consummate skilfulness. There was to be one more great effort before the end.

In the spring of 1796 Pitt's constant anxiety for peace had become more earnest than ever. He had found out the instability of the coalition and the power of France. Like the thrifty steward he was, he saw with growing concern the waste of the national resources and the strain upon commerce, with a public debt swollen to what then seemed the desperate sum of £400,000,000. Burke at the notion of negotiation flamed out in the *Letters on a Regicide Peace*, in some respects the most splendid of all his compositions. They glow with passion, and yet with all their rapidity is such steadfastness, the fervour of imagination is so skilfully tempered by close and plausible reasoning, and the whole is wrought with such strength and fire, that we hardly know where else to look either in Burke's own writings or elsewhere for such an exhibition of the rhetorical resources of our language. We cannot wonder that the whole nation was stirred to the very depths, or that they strengthened the aversion of the king, of Windham and other important personages in the government against the plans of Pitt. The prudence of their drift must be settled by external considerations. Those who think that the

French were likely to show a moderation and practical reasonableness in success, such as they had never shown in the hour of imminent ruin, will find Burke's judgment full of error and mischievous. Those, on the contrary, who think that the nation which was on the very eve of surrendering itself to the Napoleonic absolutism was not in a hopeful humour for peace and the European order, will believe that Burke's protests were as perspicacious as they were powerful, and that anything which chilled the energy of the war was as fatal as he declared it to be.

When the third and most impressive of these astonishing productions came into the hands of the public, the writer was no more. Burke died on July 8, 1797. Fox, who with all his faults was never wanting in a fine and generous sensibility, proposed that there should be a public funeral, and that the body should lie among the illustrious dead in Westminster Abbey. Burke, however, had left strict injunctions that his burial should be private; and he was laid in the little church at Beaconsfield. It was the year of Campo Formio. So a black whirl and torment of rapine, violence and fraud was encircling the Western world, as a life went out which, notwithstanding some eccentricities and some aberrations, had made great tides in human destiny very luminous.

(J. Mo.)

**BIBLIOGRAPHY.**—Of the *Collected Works*, there are two main editions—the quarto and the octavo. (1) Quarto, in eight vols., begun in 1792, under the editorship of Dr. F. Lawrence; vols. i.-iii. were published in 1792; vols. iv.-viii., edited by Dr. Walter King, sometime bishop of Rochester, were completed in 1827. (2) Octavo in 16 vols. This was begun at Burke's death, also by Drs. Lawrence and King; vols. i.-viii. were published in 1803 and reissued in 1808, when Dr. Lawrence died; vols. ix.-xii. were published in 1813 and the remaining four vols. in 1827. A new edition of vols. i.-vii. was published in 1823 and the contents of vols. i.-xii. in 2 vols. octavo in 1834. An edition in nine vols. was published in Boston, Massachusetts, in 1839. This contains the whole of the English edition in 16 volumes, with a reprint of the *Account of the European Settlements in America* which is not in the English edition.

Among the numerous editions published later may be mentioned that in Bohn's *British Classics*, published in 1853. This contains the fifth edition of Sir James Prior's life; also an edition in 12 vols., octavo, published by J. C. Nimmo, 1898. There is an edition of the *Select Works* of Burke with introduction and notes by E. J. Payne in the Clarendon Press series, new edition, 3 vols., 1897. *The Correspondence of Edmund Burke*, edited by Earl Fitzwilliam and Sir R. Bourke, with appendix, detached papers and notes for speeches, was published in 4 vols., 1844. This *Correspondence*, however, is far from being complete. It is necessary to see: *The Epistolary Correspondence of Edmund Burke and Dr. French Lawrence*, 1 vol., Rivington, 1827 (not included in the Fitzwilliam *Correspondence* of 1844); *Letters from Edmund Burke to Richard Shackleton* (in *The Leader Paper*, vol. 2.), 1862; *Correspondence of Edmund Burke and William Windham*, edited by J. P. Gilson, 1910 (Roxburghe Club). *The Speeches of Edmund Burke, in the House of Commons and Westminster Hall*, were published in 4 vols., 1816. Other editions of the speeches are those *On Irish Affairs*, collected and arranged by Matthew Arnold, with a preface (1881), *On American Taxation, On Conciliation with America*, together with the *Letter to the Sheriffs of Bristol*, edited with introduction and notes by F. G. Selby (1895).

The standard life of Burke is that by Sir James Prior, *Memoir of the Life and Character of Edmund Burke with Specimens of his Poetry and Letters* (1824). The Lives by C. MacCormick (1798) and by R. Bisset (1798, 1800) are of little value. Other lives are those by T. MacKnight (1898) and by Bertram Newman (1827). A. P. I. Samuel's *The early life, correspondence and writings of Edmund Burke* (1923), throws new light on this part of Burke's life. Of critical estimates of Burke's life the *Edmund Burke* of John Morley, "English Men of Letters" series (1879), is an elaboration of the above article; see also his *Burke, a Historical Study* (1867) lately reprinted (New York, Knapp, 1924); "Three Essays on Burke," by Sir James Fitzjames Stephen in *Horae Sabbaticae*, series iii. (1892); and *Peptographia Dublinensis, Memorial Discourses preached in the Chapel of Trinity College, Dublin, 1895-1902; Edmund Burke*, by G. Chadwick, bishop of Derry (1902). The best account of Burke's philosophy is John MacCunn's *The political philosophy of Edmund Burke* (1913). See also: Richmond Lennox, *Edmund Burke und sein politisches Arbeitsfeld* (Munich, 1923); Charles Edwyn Vaughan, "Burke," in his *Studies in the history of political philosophy* (Manchester, 1925).

**BURKE, ROBERT O'HARA** (1820-1861), Australian explorer, was born at St. Cleram, Co. Galway, Ireland, in 1820, entered the Austrian army, left it in 1848, and joined the Royal Irish Constabulary. Five years later he emigrated to Tasmania, and shortly afterwards crossed to Melbourne, where he became an inspector of police. At the end of 1857 the Philosophical Insti-

tute of Victoria appointed a committee to inquire into and report upon the exploration of the Australian interior, and an expedition was organized under the leadership of Burke, with W. J. Wills as surveyor and astronomical observer. This expedition, which left Melbourne on Aug. 21, 1860, forms a painful episode in Australian annals. Ten Europeans and three Sepoys accompanied the expedition, which was soon torn by internal dissensions. Near Menindie on the Darling, Landells, Burke's second in command, became insubordinate and resigned, his example being followed by the doctor—a German. On Nov. 11 Burke, with Wills and five assistants, 15 horses and 16 camels, reached Cooper's Creek in Queensland, where a depot was formed near good grass and abundance of water. Here Burke proposed waiting the arrival of his third officer, Wright, whom he had sent back from Torowoto to Menindie to fetch some camels and supplies. Wright, however, delayed his departure until Jan. 26, 1861. Meantime, weary of waiting, Burke, with Wills, King and Gray as companions, determined on Dec. 16 to push on across the continent, leaving an assistant named Brahe to take care of the depot until Wright's arrival. On Feb. 4, 1861, Burke and his party, worn down by famine, reached the estuary of the Flinders river, not far from the present site of Normantown on the Gulf of Carpentaria. On Feb. 26 began their return journey. The party suffered greatly from famine and exposure. In vain they looked for the relief which Wright was to bring them. On April 16 Gray died, and the emaciated survivors halted a day to bury his body. That day's delay, as it turned out, cost Burke and Wills their lives; they arrived at Cooper's Creek to find the depot deserted. But a few hours before, Brahe, unrelieved by Wright, and thinking that Burke had died or changed his plans, had taken his departure for the Darling. Burke and his companions struggled on, until death overtook Burke and Wills at the end of June. King sought the natives, who cared for him until his relief by a search party in September.

**BURKE, WILLIAM** (1792-1829), Irish criminal, was born in Ireland in 1792. After trying his hand at a variety of trades there, he went to Scotland about 1817 as a navvy, and in 1817 was living in a lodging-house in Edinburgh kept by William Hare, another Irish labourer. Towards the end of that year one of Hare's lodgers, an old army pensioner, died. This was the period of the body-snatchers or Resurrectionists, and Hare and Burke, aware that money could always be obtained for a corpse, sold the body to Dr. Robert Knox, a leading Edinburgh anatomist, for £7 10s. The price obtained and the simplicity of the transaction suggested to Hare an easy method of making a profitable livelihood, and Burke at once fell in with the plan. The two men inveigled obscure travellers to Hare's or some other lodging-house, made them drunk and then suffocated them, taking care to leave no marks of violence. The bodies were sold to Dr. Knox for prices averaging from £8 to £14. At least 15 victims had been disposed of in this way when the suspicions of the police were aroused, and Burke and Hare were arrested. The latter turned king's evidence, and Burke was found guilty and hanged at Edinburgh on Jan. 28, 1820. Hare is believed to have died in England under an assumed name. From Burke's method of killing his victims has come the verb "to burke," meaning originally to suffocate, or suppress secretly, or to kill with the object of selling the body for the purposes of dissection; later to evade or suppress an inconvenient fact or question. R. L. Stevenson's story, *The Body Snatcher*, may have been suggested in part by Burke's exploits.

See George Macgregor, *History of Burke and Hare and of the Resurrectionist Times* (Glasgow, 1884); and Messrs. Hodge's series of *Notable Trials* (1917 sqq.).

**BURLAMAQUI, JEAN JACQUES** (1694-1748), Swiss publicist, was born at Geneva, where he was honorary professor of ethics and the law of nature for 15 years. As a member of the council of state, he gained a high reputation for his practical sagacity. His *Principes du droit naturel* (1747) and *Principes du droit politique* (1751) passed through many editions, and were extensively used as text-books. His fundamental principle may be described as rational utilitarianism, and in many ways it resembles that of Cumberland.

**BURLEIGH, HENRY THACKER** (1866— ), negro barytone, composer and arranger, was born at Erie, Pa., Dec. 2, 1866. The grandson of a slave, he supported himself at various jobs until he succeeded in obtaining admittance to the National Conservatory of Music, New York, singing before a committee that included Joseffy. Here he studied for four years. The mother of Edward MacDowell took interest in him as also did Anton Dvořák, for whom he copied manuscripts. In 1894 he was appointed soloist at St. George's Episcopal church, New York, the only negro out of sixty applicants, retaining the position ever since. He is the composer of over fifty songs, including fine settings of Whitman's "Ethiopia Saluting the Colours" and Rupert Brooke's sonnet "The Soldier," festival anthems, and violin pieces, and has achieved an international reputation by his arrangements of negro spirituals, notably "Deep River." The Spingarn Medal was conferred on him in 1917.

**BURLESQUE**, a form of the comic in art, consisting broadly in an imitation of a work of art with the object of exciting laughter, by distortion or exaggeration, by turning, for example, the highly rhetorical into bombast, the pathetic into the mock-sentimental, and especially by a ludicrous contrast between the subject and the style, making gods speak like common men and common men like gods. While parody (*q.v.*), also based on imitation, relies for its effect more on the close following of the style of its counterpart, burlesque depends on broader and coarser effects. Its particular sphere is in literature, and especially in drama. The *Batrachomyomachia*, or Battle of the Frogs and Mice, is the earliest example in classical literature, being a travesty of the Homeric epic. The Italian word first appears in the *Opere Burlesche* of Francesco Berni (1497-1535). In France, during part of the reign of Louis XIV., the burlesque attained great popularity; burlesque Aeneids, Iliads and Odysseys were composed, and even the most sacred subjects were not left untravestied. Of the numerous writers of these, P. Scarron is most prominent, and his *Virgile Travesti* (1648-53) was followed by numerous imitators. In English literature Chaucer's *Rime of Sir Thopas* is a burlesque of the long-winded mediaeval romances. Among the best-known true burlesques in English dramatic literature may be mentioned the 2nd duke of Buckingham's *The Rehearsal*, a burlesque of the heroic drama, and Sheridan's *The Critic*. In the later 19th century the name "burlesque" was given to a form of musical dramatic composition with which the Gaiety theatre, London, and the names of Edward Terry, Fred Leslie, and Nellie Farren are particularly connected. The Gaiety type of burlesque gave place to the "musical comedy," and in more recent years to the "revue."

The name burlesque (*burlesca* or *burla*), is also given sometimes to instrumental compositions of an appropriately light-hearted character.

**BURLEY**, a city in southern Idaho, United States, on the Snake river and the Oregon Short Line of the Union Pacific railway system, 70m. S.W. of Pocatello; the county seat of Cassia county. The population in 1930 was 3,826. It is the shipping point for the Minidoka irrigation project (120,000ac.), and has large potato warehouses. Its industries include beet-sugar, broom, and cheese factories, alfalfa and flour mills, and a creamery. Burley was settled in 1907 and incorporated in 1918.

**BURLINGAME, ANSON** (1820-1870), American legislator and diplomat, was born in New Berlin, N.Y., on Nov. 14, 1820. In 1823 his parents took him to Ohio, and about ten years afterwards to Michigan. In 1838-41 he studied in one of the "branches" of the university of Michigan, and in 1846 graduated at the Harvard law school. He practised law in Boston, and won a wide reputation by his speeches for the Free Soil party in 1848. He was a member of the Massachusetts senate in 1853-54, and of the national House of Representatives 1855-61, being elected for the first term as a "Know Nothing" and afterwards as a member of the new Republican Party. He was an effective debater in the House, and for his impassioned denunciation (June 21, 1856) of Preston S. Brooks (1819-57), for his assault upon Senator Charles Sumner, was challenged by Brooks. Burlingame accepted the challenge and specified rifles as the weapons to be used; his

second chose Navy island, above the Niagara Falls, and in Canada, as the place for the meeting. Brooks, however, refused these conditions. In 1861 President Lincoln appointed him (June 14, 1861) minister to China. This office he held until Nov. 1867, when he resigned and was immediately appointed minister plenipotentiary to head a Chinese diplomatic mission to the United States and the principal European nations. The embassy arrived in the United States in March, 1868, and concluded at Washington (July 28, 1868) a series of articles, supplementary to the Reed Treaty of 1858, and later known as "The Burlingame Treaty." The "Burlingame Treaty" recognizes China's right of eminent domain over all her territory, gives China the right to appoint at ports in the United States consuls, "who shall enjoy the same privileges and immunities as those enjoyed by the consuls of Great Britain and Russia"; provides that "citizens of the United States in China of every religious persuasion and Chinese subjects in the United States shall enjoy entire liberty of conscience and shall be exempt from all disability or persecution on account of their religious faith or worship in either country," and grants certain privileges to citizens of either country residing in the other, the privilege of naturalization, however, being specifically withheld. Burlingame's speeches did much to awaken a more intelligent appreciation of China's attitude toward the outside world. He died suddenly at St. Petersburg on Feb. 23, 1870.

His son EDWARD LIVERMORE BURLINGAME (1848-1922) was educated at Harvard and at Heidelberg, was a member of the editorial staff of the *New York Tribune* in 1871-72 and of the *American Cyclopaedia* in 1872-76, and in 1886-1914 was the editor of *Scribner's Magazine*.

See Frederick Wells Williams, *Anson Burlingame and the First Chinese Mission to Foreign Powers* (1912); also Robert Grant, "Edward Livermore Burlingame," *Harvard Graduates' Magazine*, vol. xxxi. p. 368-370 (1923).

**BURLINGAME**, a beautiful and rapidly-growing residential town of San Mateo county, California, U.S.A., 15m. S. of San Francisco, on the bay. It has motion picture studios. The population in 1920 was 4,107; in 1930 it was 13,270 by the Federal census. The town was incorporated in 1908.

**BURLINGTON**, a city of Iowa, U.S.A., situated on the bluffs of the Mississippi river, near the south-east corner of the State; the county seat of Des Moines county. It is on Federal highways 34 and 61, and is an important railroad centre, served by the Burlington, the Rock Island, and the Toledo, Peoria and Western railways. The population in 1930 Federal census was 26,755. It has a large jobbing business, notably in furniture; extensive railway repair and construction shops; and numerous other manufactures, including baskets, furniture, Corliss engines, agricultural implements, coffins, monuments, crackers, candy, and pickles. The factory output in 1925 was valued at \$12,793,060. Crapo Park (100 ac.) occupies a camping ground of the Indian chief Black Hawk. There is a State park just north of the city, in which a municipal golf course is maintained.

Lieutenant Z. M. Pike visited the site of Burlington in 1805, and recommended the erection of a fort. A fur-trading post was established in 1829, and permanent settlers began to come in 1833, after the Black Hawk war. A town was laid out in 1834. At first it was called Flint Hills, a translation of the Indian name, but was renamed for Burlington, Vermont. The town was incorporated in 1837, and received a city charter in 1838 from the territory of Wisconsin. The territorial legislature of Wisconsin met here from 1836 to 1838, and that of Iowa from 1838 to 1840. The city adopted a commission form of government in 1917. Its two daily newspapers, the *Gazette* and the *Hawk Eye*, were established in 1837 and 1839 respectively. The latter became widely known in the years following 1872 through the humorous sketches of Robert Jones Burdette (1844-1914).

**BURLINGTON**, a city of Burlington county, New Jersey, U.S.A., on the east bank of the Delaware river and the Pennsylvania railroad, 18m. N.E. of Philadelphia. The population was 9,049 in 1920, and was 10,844 in 1930 by the Federal census. It is in the heart of a famous peach-growing region. The principal manufactures are cast-iron pipe, pipe fittings, silk, typewriter

ribbons and carbon paper. The State Masonic Home is here. Burlington is noted for its historic associations, and interesting old buildings, some of which date from early in the 18th century. One of the oldest is now the headquarters of the Daughters of the American Revolution. St. Mary's Church was built in 1703. The birthplace of James Fenimore Cooper is the home of the Historical Society, and the birthplace of Captain James Lawrence (1781-1813) still stands. Ivy-mantled St. Mary's Hall, a school for girls, was founded in 1837. The Burlington Society Library, established in 1757, and still conducted under its original charter from George II., is one of the oldest public libraries in the country. A trust fund established in 1682, when the assembly of West Jersey gave to Burlington "Matinick Island," opposite the town, "for the maintaining of a school for the education of youth," still yields revenue, which is used for the public schools.

Burlington was settled in 1677 by a colony of English Quakers, and was at first called New Beverly, but was soon renamed after Bridlington, the Yorkshire home of many of the settlers. It was incorporated as a town in 1693, and became the seat of Government of West Jersey. After the union of East and West Jersey (1702) it was one of the two capitals of the new royal province, and until 1790 the meetings of the legislature alternated between Burlington and Perth Amboy. The city was chartered in 1784. The first newspaper in the state, the *New Jersey Gazette*, established here in 1777, was influential during the Revolution.

**BURLINGTON**, an industrial city of Alamance county, North Carolina, U.S.A., on the southern railway, about 55m. N.W. of Raleigh. The population in 1930 was 9,737. It has cotton-mills making 1,000,000 yards of cloth per week; hosiery-mills with a weekly output of over 75,000 pairs; dyeing plants, furniture factories, and several other industries. The jobbing business in hosiery amounts to from \$8,000,000 to \$10,000,000 a year. The assessed valuation of property in 1927 was \$10,000,000. Burlington was founded in 1866, to be the headquarters of the North Carolina railroad, and was called Company Shops until in 1887 it was incorporated as Burlington. Elon college, a co-educational institution of the Southern Christian Church, chartered in 1889, is three miles west.

**BURLINGTON**, the largest city of Vermont, U.S.A., is situated in a beautiful spot on the east shore of Lake Champlain, just below the mouth of the Winooski river, 90m. S.E. of Montreal; it is a port of entry and the county seat of Chittenden county. It is on Federal highway 7; is served by the Central Vermont and the Rutland railways, and by lake steamers; and has a municipal airport. The area is ten square miles. The population in 1920 was 22,779, of whom 3,116 were foreign-born white; and was 24,789 in 1930 by the Federal census; in 1880 the population was 11,365, and in 1900, 18,640.

The city is built on a slope which rises to a height of 275ft., commanding views from the Green mountains 20m. E. to the Adirondacks across the lake. It is a touring centre in summer, and also attracts many visitors for the winter sports, which include ice-boat regattas. Large quantities of lumber were imported formerly from Canada, but by 1925 the total commerce of the harbour had fallen to 16,430 tons. Burlington has a large wholesale and retail trade, and numerous manufactures, including lumber, venetian blinds, windowshade rollers, ovens, dyes, butter colour, spools and bobbins, maple-sugar utensils, cotton and woollen goods, refrigerators, overalls, candy and chocolate, and printing. The total factory output in 1925 was valued at \$10,855,463. It is in the sugar-maple region, and there are many co-operative creameries in the vicinity. The assessed valuation of property in 1927 was \$25,000,000.

The University of Vermont and State Agricultural college, with an annual enrolment of about 2,000, occupies a hilltop overlooking the city. The original constitution of the republic of Vermont, drafted in 1777, provided for a university. It was chartered, largely through the efforts of Ira Allen, in 1791, by the first general assembly after the State became a member of the Union; and the agricultural college was incorporated with it in 1865. Its college of medicine, dating back to the appointment of a lecturer in chirurgery and anatomy in 1804, is one of the oldest

in the country. Ft. Ethan Allen, a cavalry and artillery post of the United States Army, is 4m. east of the city. It was the base of the relief operations by troops and by aeroplane and seaplane after the disastrous floods of November 1927.

Burlington was chartered by Governor Benning Wentworth of New Hampshire, in 1763. Settlement began in 1774, and the city was incorporated in 1865. It was the home of Ethan Allen from 1778 until his death.

**BURMA** is politically a province of the Indian empire, but is geographically a part of Indo-China, and is frequently called by the French "Indo-Chine anglaise." The province of Burma, as constituted since the annexation of Upper Burma in 1886 comprises the British territory of Upper and Lower Burma, the extensive native States known as the Federated Shan States, and Karenni, as well as several tracts of unadministered territory in the more remote parts. Lower Burma corresponds to the area acquired by the British Indian Government in the two wars of 1826 and 1852, while Upper Burma is the former independent kingdom of Burma, annexed on Jan. 1, 1886. The province stretches from 9° 55' to about 28° 30' N. and from long. 92° 10' to 101° 9' E. The extreme length from north to south is almost 1,200m. and the broadest part, which is in about lat. 21° N., is 575m. from east to west. The total area is estimated at 262,733 sq. miles. Burma proper, inclusive of the Chin hills and the administered Kachin hill tracts, occupies about 184,102 sq.m., the Shan States, which comprise the whole of the eastern portion of the province, some 62,305 sq.m., and the unadministered territory some 16,325 sq. miles. Thus the province of Burma is the largest of the provinces of India.

Roughly half of Burma lies outside the Tropics, but the configuration of the country is such that the whole may be regarded as a tropical country. In the north the boundary between Burma, Tibet and China, has not yet been precisely determined. The north-western frontier touches Assam, the dependent State of Manipur, and those portions of Bengal included in the Lushai hills and Chittagong. On the west the boundary is formed by the Bay of Bengal, in the south-west by the Gulf of Martaban. On the east the frontier touches the Chinese province of Yunnan, the Chinese Shan and Lao States, French Indo-China and Siam. In the south the boundary is formed by the Pakchan river.

**Geomorphology.**—Burma falls naturally into three great geomorphological units: (a) The Arakan Yoma, a great series of fold ranges of Alpine age, which forms the barrier between Burma and India. The foothills of the Arakan Yoma stretch as far as the shores of the Bay of Bengal. (b) The Shan plateau massif, occupying the whole of the east of the country and extending southwards into Tenasserim. The massif forms part of what has been called the Indo-Malayan mountain system and has existed as a geomorphological unit since the close of the Mesozoic. (c) The Central basin, lying between the Arakan Yoma and the Shan plateau. Formerly a gulf of the early Tertiary sea, open to the south, it is now occupied by a great spread of Tertiary rocks.

The great mountain range of the Arakan Yoma and its continuation northwards has a core of old crystalline rocks. On either side are hard, tightly folded sedimentary rocks, mainly Tertiary in age. Rocks of Jurassic and Cretaceous age are also known to occur, but the geology of the ranges is still very imperfectly known. Extensive strike faulting occurs along the eastern flanks of the Arakan Yoma and large serpentine intrusions, probably of Cretaceous age, are associated with the faults. Chromite and other useful minerals are known to occur, especially in association with the serpentine, but are not at present exploited. The western edge of the Shan plateau massif is well marked both physically and geologically. It rises

BY COURTESY OF THE NORTHERN BAPTIST CONVENTION

A "RED KAREN" GIRL. Reddish brown in colour the Karens form one of the chief hill tribes of Burma. The women weave the material for clothing

abruptly from the valley, and for 400 or 500m. the edge is formed by a long strip of granitic or gneissose rocks. The predominant rocks in the Shan plateau are gneisses—which yield the rubies and other gems for which Burma has so long been famous—and a massive limestone of Devonian-carboniferous age. Rocks of all ages from pre-Cambrian to Jurassic occur in the massif, whilst deposits of late Tertiary and Pleistocene age occupy old lake-basins. In pre-Cambrian rocks at Mogoke occur the principal ruby “mines,”—but the industry is now of minor importance. At Bawdwin, associated with a group of ancient volcanic rocks, are very extensive deposits of silver-lead ore, mainly argentiferous galena, which are worked by the Burma Corporation, Ltd., and smelted at the nearby works of Namtu. The refined silver and lead are sent by rail to Rangoon for export. Other silver-lead deposits are known in other parts of the Shan States, and have been worked in the past by the Chinese. Tenasserim forms a continuation of the tin-bearing belt of Malaya, and large quantities of tin and tungsten are obtained. Geologically this portion of the Indo-Malayan mountains consists of large granitic intrusions, elongated in the north-south direction and intruded into a series of ancient rocks of unknown age. The basin of the Irrawaddy between the Arakan Yoma and the Shan plateau, consists almost entirely of Tertiary rocks. The beds are remarkable for their enormous thickness; the Eocene beds reach upwards of 15,000ft.; the Peguan (Oligo-Miocene) upwards of 16,000ft., and the Irrawaddian (Mid-Pliocene) upwards of 5,000 feet. Forming a line down the centre of the basin are the well known oilfields of Burma. The oil occurs mainly in rocks of Peguan age. From north to south are the fields of Indaw, Yenangyat, Singu, Yenangaung, Minbu and several minor fields. The most important fields are Yenangaung and Singu. Brown coal also occurs in considerable quantities in the valley of the Chindwin and elsewhere in the Tertiary rocks, but as yet has been little used. Along a line running, roughly, along the centre of the ancient Tertiary trough, are numerous extinct volcanoes; some form small tuff cones with small crater lakes; others are plugs of rhyolitic matter, but the largest is the complex cone of Mt. Popa.

**Physical Features.**—The three physical units into which Burma is naturally divided have already been mentioned as geomorphical units. Burma is separated from the remainder of the Indian empire by a long fold range, uplifted at the same time as the Himalayas in India. In the north the range is narrow, and known as the Patkai hills. Further south the direction changes from south-west to south and the ranges broaden out, enclosing the Manipur plateau. The individual parts have received different names, and include the Naga hills, Chin hills and Lushai hills, but from Manipur southwards the whole range is known as the Arakan Yoma. As such it becomes narrower, curves round to south-south-east and terminates in Cape Negrais, though geologically the same series of folds is continued in the Andaman and Nicobar islands. A small part of Burma—the division of Arakan (*q.v.*)—lies between the Arakan Yoma and the Bay of Bengal. Some of the peaks of the Arakan Yoma rise to over 10,000ft., and the highest is believed to be Mt. Victoria. The whole range forms an effective barrier between Burma and India proper. The east of Burma, including the whole of the Shan States (*q.v.*), is occupied by a plateau, which forms part of the great Yunnan plateau of China. The plateau averages 3,000ft. in height, but its surface has been much dissected, and running through the centre from north to south is the deep trough occupied by the Salween river. Southwards, the plateau passes through Karenni into that part of Burma known as Tenasserim, and gradually loses its plateau character.

Between the Arakan Yoma on the west and the Shan plateau on the east, lie the basin of the Irrawaddy and its great tributary, the Chindwin, and the basin of the smaller Sittang. This is for the most part a lowland area, with ranges of hills—of which the Pegu Yoma is the most important—running from north to south. Almost in the centre the extinct volcano of Mt. Popa reaches nearly 5,000ft. above sea-level. The Arakan coast of Burma is Pacific in type, it is rocky and dangerous, backed by high mountains and fringed by islands. Of the islands, Ramree and Cheduba

are the largest. The Tenasserim coast is similar; in the south is the Mergui archipelago. Between the Arakan and Tenasserim coasts lies the low delta of the Irrawaddy and Sittang rivers.

Most of the hilly and mountainous regions were formerly forest covered, and over large areas have good, fertile forest soils. Where clearings have been made, temporary cultivation has destroyed the virgin richness of the soil. In the wetter regions the heavy rains often entirely wash away the soil from cleared hill sides and expose the bare rock. The limestone rocks of the Shan plateau are usually covered by a thin red soil from which the lime has been entirely leached out. The richest soils in the province are the alluvial soils of the flat Irrawaddy delta and the broad river valleys. Excellent loamy soil is also afforded by the mixed clays and sands of the Peguan rocks, but the Irrawaddian and other sandy series give rise to extensive tracts of very light soil, almost pure sand. In the wetter parts of Burma, owing to the well marked dry season, a thick mantle of lateritic soil stretches over most of the lowland tracts.

**Climate.**—Burma forms part of the great Monsoon region of Asia, but its climate is profoundly modified by the relief of the country. There are really three seasons, the cool season, which is also rainless, sets in towards the end of October and lasts till February, the hot season (rainless) from March to the end of May or early June and the rainy season from June to October. October is an unpleasant month; the rains have almost ceased, but the temperature and humidity are high. Along the coast, and especially in the south (Tenasserim), both the daily and annual range of temperature are small. In Moulmein the annual range is 8°; in Rangoon it is 10°. Away from the moderating influence of the sea, the range of temperature increases greatly, and is especially large in the dry belt. The annual range in Mandalay is 20°. The average temperature in the south of Burma is 80°.

From October to May Burma is under the influence of the north-east trade wind or the north-east monsoon as it is more often called. The north and south alignment of the mountains causes this wind to blow almost directly from the north. It is a cool wind, but decreases in intensity towards the end of the dry season. The change to the south-west monsoon is heralded by thunderstorms towards the end of May, but the rains do not usually break until about June 15. The south-west monsoon, blowing as it does from the Indian ocean, is the rain-bearing wind. A glance at a physical map will show that the coastal districts receive the full force of the wind, and a heavy rainfall in consequence. Most of Arakan has nearly 200in. (5,120mm.) of rain. Rangoon enjoys an annual fall of 99.in. (2,537mm.). The heart of Burma lies in the lee of the lofty Arakan Yoma and the rainfall is scanty—as little as 20in. in the heart of the dry belt. Mandalay lies in this dry region and receives an average of 33.4in. (855mm.). Owing to its elevation, the Shan plateau has a moderately good rainfall.

**Rivers and Lakes.**—The rivers of Burma fall into three groups. There are numerous short, rapid streams, such as the Naaf, Kaladan, Lemru and An, which flow down from the Arakan Yoma into the Bay of Bengal. The centre of Burma is drained by the Irrawaddy (*q.v.*) and its tributaries, and by the Sittang. The Shan plateau is drained mainly by the Salween (*q.v.*) and its tributaries; in Tenasserim there are again a number of short, rapid rivers flowing from the hills into the Gulf of Martaban. The longest is the Tenasserim river.

The largest lake in Burma is a shallow stretch of water in the Federated Shan States, known as Inlé lake. It is the remnant of a much larger lake; is rapidly becoming smaller, and occupies a hollow in the surface of the plateau. A large lake known as Indawgyi, is found in the north of Burma near Mogaung. It has an area of nearly 100 sq.m. and, with the decreasing size of Inlé lake, should perhaps be given pride of place. It is surrounded on three sides by ranges of hills, but is open to the north where it has an outlet in the Indaw river. In all the lowland tracts there are numerous small lakes occupying deserted river meanders. In the heart of the delta numerous large lakes or marshes, abounding in fish, are formed by the overflow of the Irrawaddy river during the rainy season, but decrease in the dry season.

**Vegetation.**—The wide range of rainfall in Burma is responsible for great variations in the natural vegetation. Frost never occurs in the lowlands, but roughly, above 3,000 ft. the occasional frosts have caused a great change in vegetation. Above that level, which may conveniently be called the frost line, evergreen oak forests, sporadic pine forests and wide areas of open land, with bracken and grass, are the rule. Rhododendron forests occur at high levels. Below the frost line the natural vegetation depends mainly upon the rainfall: (a) With more than 80 in. of rain, evergreen tropical rain forests occur. The trees of the forests are of many species, but more than one-half belong to the Dipterocarpaceae. The timbers are hard and little used. (b) With between 40 and 80 in. of rain are the monsoon forests which lose their leaves during the hot season. These forests are the home of the valuable teak tree, as well as the pyinkado and other useful timber trees. (c) With less than 40 in. the forest becomes very poor and passes into scrubland and semi-desert. There is little or no true grassland. (d) Extensive areas of the Irrawaddy delta are clothed with tidal forests, in which some of the trees reach a height of over 100 ft., and are of considerable value.

The wasteful methods of the native cultivator have, in the past, resulted in the destruction of vast areas of valuable forest. The practice was to cut down and burn a tract of virgin forest, cultivate the field (*taung-ya*) so formed for two or three years while the pristine freshness of the soil lasted and then to desert it for a fresh tract. It is but rarely that the forest established itself again over the deserted *taung-ya*; more often the area became covered with a tangled mass of bamboo, bracken or grass. For more than half a century, however, the Forest Department has been at work, and all the valuable forests are constituted into Government reserves. Reserves covered 28,372 sq.m. in 1926. Various privileges are accorded to the natives who live within the reserved area. The timber (mainly teak for constructional work and pyinkado—*Xylia dolabriformis*—for railway sleepers), is worked either by Government or by lessees—public and private companies—under careful supervision. Extraction is so controlled that it shall not exceed regeneration. The output of teak in 1925–26 was 339,526 tons, and of other reserved timbers 163,318 tons. Timber is third in importance amongst the exports of Burma, and for some years past the annual exports have been roughly 150,000 tons annually; worth about £1,500,000. More than half Burma is forested.

**Fauna.**—The anthropoid apes are represented by two gibbons, and there are about a dozen species of monkeys. Tigers are still common throughout the province; leopards and several species of wild cat also occur. The Himalayan black bear and the Malayan bear are found in the hills. Bats are numerous and the huge flying fox is particularly common in several of the large towns. Amongst the hoofed quadrupeds, the elephant is still numerous in many of the denser forests, and numbers are caught annually in “keddahs” and trained for forest work. Two species of rhinoceros occur, but are now far from common. Amongst wild oxen and deer the *sain*g or wild buffalo is common, and so is the *banting*. The small barking deer (*gyi*) is the commonest of the larger animals and is still abundant almost everywhere. The *thamin*, *sambhuar* and hog-deer are also common. A licence is required for hunting most of the larger animals, and many of them enjoy a “close season.” The half-wild pariah or “pi” dogs swarm in every village. Amongst the numerous birds, the bright hued small parrots may be specially noted, and the ubiquitous paddy bird. Crows are exceedingly abundant and very bold. A characteristic lizard is the house gecko or *taukte* (so called because it makes a loud croaking noise like *taukte*, repeated four to ten times). Snakes, including the python, are numerous.

**Natural Regions.**—For an adequate study of this large and varied province, a division into at least seven natural regions is desirable: (1) The Arakan coastal strip is hilly or mountainous, has a very heavy rainfall and is covered with the remnants of a dense evergreen forest which has, however, been largely replaced by dense bamboo thickets. This region is sparsely inhabited, and the population is concentrated round the principal town and port of Akyab. Communication with the rest of Burma is

difficult, except by sea. The region coincides roughly with the districts of Akyab, Kyaukpyu, Sandoway and the western strip of Bassein. (See ARAKAN and AKYAB.) (2) The Tenasserim coastal strip is similar, but is of importance as the tin and wolfram producing region. Rubber plantations are increasing in importance. Moulmein is the chief town. The region coincides roughly with the districts of Mergui, Tavoy, Amherst, Thaton and Salween. (See TENASSERIM and MOULMEIN.) (3) The Western hills region consists of the mountainous, almost uninhabited, tracts of the Arakan Yoma and its hill ranges. Such districts as the hill district of Arakan, Pakokku hill tracts, Chin hills and Somra tract, lie wholly within this region. (4) The Northern hills region occupies the north of the country and includes the sources of the Irrawaddy and its principal tributary, the Chindwin. The region is as yet little developed. It includes the districts of Upper Chindwin, Myitkyina, Katha and most of Bhamo. (5) The dry belt occupies the heart of Burma. It is a flat and fairly thickly populated region, extensively cultivated and having some irrigated areas. The oilfields, with one exception, lie in this region. It coincides, roughly, with the districts of Lower Chindwin, Shwebo, Sagaing, Mandalay, Pakokku, Myingyan, Meiktila, Minbu, Magwe, Thayetmyo and Yamethin. (6) The deltas region, including the deltas of the Irrawaddy and Sittang rivers and the intervening forested ridge of the Pegu Yoma, is the most important and the most thickly populated part of Burma. It includes the districts of Hanthawaddy, Pyapon, Maubin, Myaungmya, most of Bassein, Henzada, most of Prome, Tharrawaddy, Insein, Pegu and Toungoo. (7) The Shan plateau was, until recently, cut off in a remarkable way from the rest of Burma, and still preserves many distinctive features. The region coincides, roughly, with the Federated Shan States.

Burma is essentially a rural country. Only two towns have over 100,000 inhabitants—Rangoon with 341,962, and Mandalay with 148,917. The smaller towns are river ports, collecting and distributing centres, or have achieved some importance from having been chosen as the headquarters of a district. The dry belt is the natural geographical centre of Burma and therein lie the old Burmese capitals—Pagan, Shwebo, Ava, Amarapura and Mandalay, with Prome on the southern borders of the dry belt.

**Population.**—The census of 1921 gives the population of Burma as 13,212,192.

Total Population of Burma over Comparable Area

| Census year    | Number     | Increase % |
|----------------|------------|------------|
| 1901 . . . . . | 10,278,715 |            |
| 1911 . . . . . | 11,763,961 | 14.4       |
| 1921 . . . . . | 12,790,754 | 8.7        |

The inhabitants of Burma belong to many races and speak many languages. In general, the native races are all Mongolians: the Burmans are the most advanced, and occupy the fertile lowlands; the other races are restricted to the hills. Every year large numbers of Indians are attracted to Burma by the higher rates of wages, and the opportunities for trading and cultivation. A considerable proportion of the Indian immigrants settle permanently. Burma is in the interesting position of being an underpopulated country, capable of considerable development, lying between two of the most densely populated countries in the world—India and China. It is believed that Burma has been populated by successive waves of migration from the north; indeed the advance of the Kachin races was still in progress when Burma was annexed to the British empire. The Burmans, including the closely allied Arakanese of the Arakan coast, the Talaings of the country around Moulmein, and the Tavoyans around Tavoy, number more than 11 millions. The national dress is a cylindrical skirt, called a lungyi, worn folded over in a simple fold in the front and reaching to the ankles. All Burmese, of both sexes, prefer silks of bright but delicate shades, and even the poorest possesses at least one silk lungyi. The distinctive silk woven in the district round Mandalay, is still in general use. The lungyi is worn by both sexes, the men wear also a single breasted short jacket of sombre hue, called an *aingyi*; the women

# BURMESE LIFE AND INDUSTRY

1. The Ananda Pagoda, in Pagan, a town on the Irawaddy river
2. Bullock cart, customary means of travel on a country road
3. A market in Rangoon. Most of the retail trade of the city is carried on in these markets, which are built on stilts
4. Women drawing buckets of oil from open well at Yanangyang
5. Burmese well, Yanangyang, showing a windlass run by hand
6. Oil press, Yanangyang, showing a windlass run by hand
7. Burmese girls of Rangoon smoking native cigars or cheroots
8. Bamboo rafts on a tidal creek in the Irawaddy delta
9. Women working in a lower class of native well. Others are working in a first class well, which is built on stilts

garment is similar but double breasted and usually white. The older generation of Burmese men wear their straight black hair long, tied in a knot on one side of the head. It is now general to cut the hair in European style. The men's head-dress is a gambauing—a strip of brightly-coloured thin silk wound round the head. The women oil their long tresses with coconut oil and coil them in a cylindrical coil on the top of the head.

The Burmans are Buddhists, and their religion occupies a large place in their life. The spiritual head of every village is the yellow-robed Hpoongyi, or monk. The monastery, or hpoongyi-kyauing just outside the village walls—all Burmese villages are surrounded by a fence against wild animals and robbers—is also the village school. Every village has its pagoda, a silent reminder of the precepts of Buddha, and the whitewashed pagodas crown almost every hill, but there are no temples in the ordinary sense of the word. As a result of the numerous village schools, the percentage of wholly illiterate men is small. The women are more industrious and business-like than the men, but their school education has been neglected. The Burmese women enjoy an amount of freedom unusual in non-European races. As a whole the Burmese are characterized by cleanliness, a sense of honour and a love of sport, but addicted to a life of ease and laziness. The various hill tribes are, in general, less advanced than the Burmese. Perhaps the most advanced are the Karens, who inhabit the Arakan Yoma, the Pegu Yoma and the native State of Karenni, and are also found as scattered communities in the delta. The Shans occupy most of the Shan plateau and are also found in the upper part of the Chindwin valley. The Kachins belong mainly to the far north, the Chins to the western mountains, whilst on the Chinese borders are found the Palaungs, Was, etc. Some of the latter are still addicted to the barbarous practice of head hunting. All the hill tribes of Burma are non-Buddhists, being for the most part Animists. Christianity has made rapid strides amongst them, especially amongst the Karens.

The Indians have settled mainly in the delta regions, in Arakan and along the rivers and railway lines. Except in the remoter districts, Indians supply nearly all the coolie labour, whilst the indolent habits of the Burman often result in his falling into the clutches of the Indian moneylender. There are now roughly a million Indians in Burma, drawn mainly from Madras, Behar and Orissa and Bengal. The Chinese form an important community. Except on the border in the north-east, where the Yunnanese and Chinese Shans are found, the Chinese belong essentially to the artisan and merchant classes, and make excellent law-abiding citizens.

Europeans, mainly English and Scotch, number rather less than 10,000; very few can be regarded as permanent residents. Eurasians (now officially termed Anglo-Indians) number about 10,000. The Eurasians find employment as clerks in minor administrative capacities, and on the railways.

**Religion.**—The chief religious principle of the Burman is to acquire merit for the next re-incarnation by good works done in this life. The bestowal of alms, offerings of rice to priests, the founding of a monastery, the erection of a pagoda or the building of a rest house (zeyat) for travellers, are all works of religious merit. An analysis shows that less than two in every thousand Burmans profess Christianity, and there are one per thousand of Mohammedans among them. It is admitted by the missionaries themselves that Christianity has progressed very slowly amongst the Burmans in comparison with the rapid progress made amongst the Karens. It is amongst the Sgaw Karens that the greatest progress in Christianity has been made, and the number of Animists among them is very much smaller. The number of Burmese Christians is considerably increased by the in-

BURMESE WOMAN IN NATIONAL DRESS, OF BRIGHT SILK LUNGYI (SKIRT) AND WHITE DOUBLE BREASTED JACKET

clusion among them of the Christian descendants of the Portuguese settlers of Syriam deported to the old Burmese Tabayin, a village now included in the Ye-u sub-division of Shwebo. These Christians returned themselves as Burmese. The forms of Christianity which make most converts in Burma are the Baptist and Roman Catholic faiths.

**Education.**—Education, apart from the old established monastic schools, is controlled by the Education Department. There are primary, middle and high schools, divided into two groups; the English schools mainly for Anglo-Indians, in which the medium of instruction is English, and the Anglo-vernacular schools, in which the medium of instruction is usually the vernacular in the lower standards and English in the higher standards. In 1925-26 there were 6,694 institutions, with 411,398 pupils. A university with two colleges, one Christian and one non-religious, has been constituted at Rangoon since 1920; formerly the Rangoon college was a constituent college of Calcutta university.

The Burmese language is a monosyllabic, agglutinative language, more closely allied to Chinese than to the Indian languages. A single syllable may have six or more meanings, according to the tone used or to the way in which the syllable is stressed. Many dialects and languages belonging to the Burmese group are distinguished, quite apart from the entirely distinct languages spoken by the Shans, Kachins, Karens and other hill tribes. Burmese and English are the official languages. Hindustani is widely spoken wherever Indian labour is employed.

*Languages Spoken in Burma, 1921*

(Distribution of total population by race groups, classified by language)

|   | No. of persons | No. per 10,000 of population |
|---|----------------|------------------------------|

|   | 13,169,099     | 10,000                       |

*Note:* There is an increasing tendency for Burmese to become the language of people belonging racially to such groups as Kuki-Chin, Kachin and Tai.

The Burmans adopted alphabets borrowed from the old, rock-cut Pali of India. Thus their alphabet, their religion and a considerable number of words, are of Indian origin. Burmese music is distinctive; their melodies are mainly composed of the five notes, C, D, E, G, A; they do not use semi-tones, so the chromatic scale is unknown. Music is essentially associated with the drama. Characteristic instruments include the *kyi-waing*, a series of gongs cast out of bell metal, arranged in a circular frame of

stout cane and the *saing-waing*, composed of 18 cylindrical drums hung from a circular frame.

**Government.**—The divisions of Arakan and Tenasserim were annexed to the British empire after the First Burmese War in 1826; Pegu after the Second Burmese War in 1853. These three divisions constitute Lower Burma. Upper Burma was annexed in 1886 after the Third Burmese War. As a province of India, Burma comes under the Central Government of India, and so under the secretary of State for India in London. At the head of the Provincial Government of Burma is the governor. In accordance with the policy of the British Government in giving a large measure of self-government to the native races of India, native ministers have, since Jan. 1923, played an important part in government. An excellent summary of the present form of administration is given in the *Report on the Administration of Burma for the Year 1921-22*. With effect from Jan. 2, 1923, the province of Burma was constituted a governor's province under the Government of India Act. The executive authority of Government vests in a governor in council in respect of a small number of subjects known as reserved subjects, and in the governor acting with ministers in respect of subjects known as transferred subjects. The governor and the two members of his executive council (one of whom must have been for at least 12 years in the service of the Crown in India) are appointed by the King by warrant under the royal sign manual. The ministers also number two, and are appointed by the governor from among the non-official elected members of the Legislative Council. The principal transferred subjects dealt with by the ministers (who are normally natives of Burma) include local self-government, medical administration, public health, education, public works, agriculture, forests, etc. The Legislative Council consists of 103 members, of whom two are members of the Executive Council, 79 are elected by the popular franchise, and 22 are nominated by the governor. Of the 22 nominated members not more than 14 may be officials. In order to secure adequate representation of Indian and other minorities out of the 79 constituencies there are eight of Indian urban communities, five of rural Karen communities, eight of European and Anglo-Indian (Eurasian) communities, and six special constituencies, such as the university. The remainder are ordinary rural or urban constituencies. The legislative authority of the council extends over the territories constituting the province of Burma, with the exception of the "backward tracts." The council may not impose any new taxes or deal with matters which are the concern of India as a whole, but otherwise may repeal or alter, as to the province of Burma, any law made by any authority in British India. The annual estimates of provincial revenue and expenditure are laid before the council and, subject to certain safeguards in respect of reserved subjects, funds for proposed expenditures are voted by it. In addition to his authority over the province of Burma, the governor also exercises political control over Karenni, a tract consisting of several petty States between Burma and Siam.

The Federated Shan States, the Shan States of Hsawngsup and Singkaling Hkamti, the Chin hills (including the Pakokku hill tracts, the Somra tract and hill district of Arakan), and certain other areas, have been declared "backward tracts" under the Government of India Act, and are excepted from the authority of the Legislative Council. The authority of the ministers does not extend to these areas, which are wholly in the charge, in the case of the Federated Shan States, of the governor, and in the case of the "backward tracts," of the governor in council. A special personnel for the administration of the "backward tracts" is provided by the Burma Frontier Service.

The province is at present divided into eight divisions, each in charge of a commissioner, they are Arakan, Pegu, Irrawaddy, Tenasserim, Magwe, Mandalay, Sagaing and the Federated Shan States. The commissioners are responsible to the governor in council, each in his own division, for the working of every department of the public service except the military department and part of the judicial department. The divisions are further divided into districts (of which there are about 40) each in charge of a

deputy commissioner. Deputy commissioners perform the functions of district magistrates, collectors, registrars and sometimes of assistant commissioners of income tax and district judges. Subordinate to the deputy commissioners are assistant commissioners, extra assistant commissioners and myoöks. The myoöks or township officers are drawn from the ranks of the subordinate civil service and are the ultimate salaried representatives of Government who come into most direct contact with the people. The extra assistant commissioners are members of the Burma Civil Service; higher officials are members of the Burma Commission and are mostly officers of the Indian Civil Service. Finally there are the village headmen or *thugyis*, chosen by the villagers and approved by Government, who have limited magisterial powers and collect the *thathmeda* or head tax.

The land and revenue administration of the province is controlled by a financial commissioner assisted by a secretary. Under the control of the financial commissioner are the Excise Department (dealing with opium and salt), customs, settlements and land records. The High Court of Judicature at Rangoon was established in 1922. It consists of a chief justice and seven other judges. In 1925 the Province was divided into 23 session divisions. The activities of the Government in connection with agricultural and industrial development are under the control of a development commissioner, subordinate to whom are the Department of Agriculture, the Rangoon Development Trust, the co-operative societies registrar and the veterinary adviser. The Public Works Department is under the control of chief engineers for buildings, roads and irrigation. The Police Department is under the control of an inspector-general; the military police (used mainly in frontier tracts) are under a deputy inspector-general. The Forest Department is administered by a chief conservator of forests and the province is divided into a number of "circles," each under a conservator, assisted by officers of the Indian, provincial and subordinate forest services. (For details regarding the administration of the Federated Shan States see SHAN STATES.) For Burmese law see INDIAN LAW.

**Agriculture and Industries.**—Burma is essentially an agricultural country. Only 15% of the people were classed as urban in 1921, and a considerable proportion of this number were natives of India. The agriculture is concentrated on the alluvial lands of the delta and the valleys of the Irrawaddy, Chindwin and Sittang. Rice is by far the most important crop, and occupies two-thirds of the cropped area. The production of rice is roughly 7,000,000 tons per year, or more than half a ton per head of population. There is, in consequence, a large export. Where the rainfall is less than 40 in. rice cannot be grown without irrigation, and cultivation in the dry zone is largely concentrated on sesamum, millet, groundnuts, cotton and beans. In the dry belt nearly one and half million acres are irrigated. At the time of the British annexation of Burma there were some old irrigation systems in the Kyaukse and Minbu districts, which had been allowed to fall into disrepair, and these have now been renewed and extended. In addition to this the Mandalay canal, 40 m. in length, with 14 tributaries, was opened in 1902; the Shwebo canal, 27 m. long, was opened in 1906, and later, two branches 29 and 20 m. in length and the Mon canal, started in 1904, 53 m. in length. Throughout the country, fruits, vegetables and tobacco are grown for home consumption, and fodder where required. In comparison with India, there is room for considerable agricultural expansion. Burma, and official returns class 50 million acres as cultivable waste, as against under 20 million acres of "occupied" land. Of about 16 million acres under cultivation (not including the Shan States) the areas occupied by the principal crops are:—

|                         | 1921-22    | 1925-26    |
|-------------------------|------------|------------|
|                         | Acres      | Acres      |
| Rice . . . . .          | 10,500,000 | 11,560,000 |
| Sesamum . . . . .       | 1,000,000  | 1,135,000  |
| Millet . . . . .        | 850,000    | 700,000    |
| Various beans . . . . . | 850,000    | ..         |
| Groundnuts . . . . .    | 320,000    | 500,000    |
| Cotton . . . . .        | 300,000    | 450,000    |

There are numerous rubber plantations, especially in Mergui and Tavoy.

Small humped oxen are kept everywhere as beasts of burden and for use in ploughing. They are replaced to a considerable extent in the delta and wetter areas by the heavier water buffalo. Herds of small goats are numerous in the dry belt, and small numbers of very poor sheep are reared.

Fisheries and fish-curing exist both along the sea-coast of Burma and in inland tracts, and afforded employment to 157,855 persons in 1921. Salted fish forms, along with boiled rice, one of the chief articles of food among the Burmese. Some pearling grounds in the Mergui archipelago are worked spasmodically for mother-of-pearl.

The most important mineral product of Burma is petroleum. The following table shows the production in recent years:

|                 |                   |
|-----------------|-------------------|
| 1909-13 average | 236,500,000 gals. |
| 1916-20 average | 282,600,000 gals. |
| 1921-25 average | 276,500,000 gals. |

(249 gals.=one metric ton)

Since 1918 the value of the output has been nearly Rs.10 crores. Very little use has yet been made of the extensive deposits of brown coal or lignite. The most important fields lie in the Chindwin valley and in old lake basins of the Shan plateau. Some of the latter also yield oil shale. Mention has been made of the silver-lead deposits of Bawdwin; in 1925 the output of silver and lead ore, mainly from these mines, was 322,000 tons, valued at 108 lakhs. The Burma Corporation produced 48,000 tons of refined lead; 4,832,000oz. of refined silver, as well as zinc and copper. The mines of Tenasserim produced large quantities of tin and tungsten during the years 1914-18, but the present output fluctuates widely with the price of the metals. The output of tin in 1925-26 was 2,220 tons, worth 35 lakhs. The historic Burma Ruby Mines, Ltd., after many vicissitudes, went into liquidation in 1925-26. The famous jade of China is found in the north of Burma and exported overland to China via Mogaung and Bhamo. The mines are situated beyond Kamaing, north of Mogaung, in the Myitkyina district. The miners are all Kachins, and the right to collect the jade duty of 33½% is farmed out by the Government to a lessee, who has hitherto always been a Chinaman. The amount obtained has varied considerably. In 1887-88 the rent was Rs.50,000. This dwindled to Rs.36,000 in 1892-93, but the system was then adopted of letting for a term of three years and a higher rent was obtained. The value varies enormously according to colour, which should be a particular shade of dark green. Semi-transparency, brilliancy and hardness are, however, also essentials. The old river mines produced the best quality. The quarry mines on the top of the hill near Tawmaw produce enormous quantities, but the quality is not good.

Gold is found in most of the rivers in Upper Burma, but the gold-washing industry is for the most part spasmodic, in the intervals of agriculture. Amber is extracted by Kachins in the Hukawng valley, but the quality of the fossil resin is not very good. Salt is manufactured at various places in Upper Burma, notably in the lower Chindwin, Sagaing, Shwebo, Myingyan and Yamethin districts, as well as in the Shan States. Iron is found in many parts of the hills.

**Communications.**—From time immemorial the principal highway of Burma has been the Irrawaddy (*q.v.*) and its tributaries. Even at the present day the railways have rather supplemented than replaced the rivers as highways of trade. The Burma railways (1,749m. in 1925) are for the most part the property of the province, but are operated by the Burma Railways, Ltd. They are all metre gauge. The main line runs from Rangoon to Mandalay, where it is interrupted by the Irrawaddy, but is continued on the opposite bank of the river to Myitkyina. There is no railway connection with India proper, nor with any neighbouring country. The centre of the oilfields, Yenangyaung, is still only accessible by river. Burma is badly in need of roads, which are non-existent over most of the country. There is not even a motor road from Rangoon to Mandalay. Outside Rangoon and Mandalay, there are no hotels; but there are houses, built primarily for the use of Government officials on tour, where the

traveller may obtain shelter for a nominal payment. Most of the smaller villages of Burma consist of a collection of from a dozen to 100 or more huts, built of timber uprights and bamboo. The villages are surrounded by a bamboo or wooded stockade—mainly as a protection against wild animals. Whilst the civil head of the village is the thugyi, or headman, chosen by the villagers and recognized by Government, the spiritual head of the village is the senior hpoongyi of the neighbouring hpoongyi kyaung. Larger villages or towns arise as collecting or distributing centres, or have important bazaars. In many cases their importance has been enhanced by their having been made the administrative headquarters of a district or a division. A large number of the more important towns are river ports.

The staple industry of Burma is agriculture, but many cultivators are also artisans in the by-season. In addition to rice-growing, the felling of timber, and the fisheries, the chief occupations are rice-husking, silk-weaving and dyeing. The most important of the non-agricultural manufacturing industries is that connected with the working and refining of oil. The principal refineries are at Syriam, near Rangoon. The introduction of cheap cottons and silk fabrics has dealt a blow to hand-weaving, while aniline dyes are driving out the native vegetable product; but both industries still linger in the rural tracts. The best silk-weavers are to be found at Amarapura. The total number of persons engaged in the production of textile fabrics in Burma, according to the census of 1921, was 115,338, against 419,007 in 1901. The chief dye-product of Burma is cutch, a yellow dye obtained from the wood of the *sha* tree. Cutch-boiling forms the chief means of livelihood of a number of the poorer classes in the Prome and Thayetmyo districts of Lower Burma, and a subsidiary means of subsistence elsewhere. Cheroot making and smoking is universal with both sexes. The chief arts of Burma are lacquer working (centred at Pagan), wood carving and silver work. The floral wood-carving is remarkable for its freedom and spontaneity. The carving is done in teak wood when it is meant for fixtures, but teak has a coarse grain, and otherwise *yamane* clogwood, said to be a species of *Gmelina*, is preferred. The tools employed are chisel, gouge and mallet. The design is traced on the wood with charcoal, gouged out in the rough, and finished with sharp fine tools, using the mallet for every stroke. The great bulk of the silver work is in the form of bowls of different sizes, in shape something like the lower half of a barrel, only more convex, of betel boxes, cups and small boxes for lime. Both in the wood-carving and silver work the Burmese character displays itself, giving boldness, breadth and freedom of design, but a general want of careful finish.

The following table shows the progressive value of the trade of Burma since 1871-72 in lakhs of rupees (one lakh=Rs.100,000).

| Year    | Imports | Exports |
|---------|---------|---------|
| 1871-72 | 3.16    | 3.78    |
| 1881-82 | 6.38    | 8.06    |
| 1891-92 | 1.050   | 1.267   |
| 1901-02 | 1.278   | 1.874   |
| 1909-14 | 2.405   | 3.723   |
| 1914-19 | 2.285   | 3.838   |
| 1919-24 | 3.882   | 6.136   |
| 1925-26 | 4.588   | 7.773   |

Approximately 86% of the foreign trade of Burma passes through Rangoon (*q.v.*). Other leading ports are Bassein, a rice port on the west of the delta; Akyab, the outlet of Arakan; and Moulmein, Tavoy and Mergui, which serve the Tenasserim division. Of the export trade, well over one-third is with India, more than one-third with other parts of the British empire, especially the home country and only one-quarter with foreign countries. Of the import trade nearly one-half is with India and only one-fifth with foreign countries outside the British empire. The principal exports are rice, petroleum products, timber, cotton, hides and skins, metals and ores, beans, rubber and lac. The export of rice varies between two and three million tons, and in 1925-26 represented 44% of the total exports. The principal imports are cotton goods, machinery and hardware, coal, silk and sugar. The currency in Burma is that in use throughout India, but the common unit of weight is the Burmese viss.

### HISTORY

The earliest history of Burma is mainly conjectural. It is believed that the aborigines were a Negrito race of which the only survivals are to be found in the Andaman islands, once part of the mainland. The present inhabitants of Burma are descendants of different Mongolian tribes, which migrated at a remote period from western China and Tibet, by the Irrawaddy and Salween rivers and penetrating into Arakan. The Tais or Shans spread over the Shan States and Siam, on both sides of the Chinese frontier, and encroached into Burma proper. The Krans went off into Arakan, the Pyus established a kingdom at Prome, and the Mons or Talaings in Pegu. Immigrants came from Chittagong, into Arakan, from Manipur into Upper Burma, and from Madras and Malaya into Pegu and Tenasserim. The Hindu mythology ousted Mongolian traditions, but Buddhism, subdued by Brahminism in India, in its turn overcame Brahminism in Burma, and through its wonderful monastic system has directed the religious lives of the people for some 2,000 years. Legend and fable, in which innumerable tribal chiefs figured as mighty kings, only gave way to authentic history when King Anawrahta (a contemporary of William the Conqueror) founded the Pagan dynasty in A.D. 1054. He and his ten successors were the first real rulers of Burma. He expelled the debased Ari priesthood and forcibly imported the purest form of Buddhism, monks and scriptures from its seat at Thaton. The Ananda, the gem of the Pagan pagodas, was built in the reign of Kyanzittha (1084–1112). The Pagan dynasty included pious sovereigns like Htilominlo (1210–34), and his son, Kyaswa (1234–50), but the later sovereigns degenerated, and the last of them—Narathihapate—earned the vengeance of Kublai Khan and lost his kingdom in 1287 by the execution of three distinguished ambassadors with their retinues sent by the emperor of China.

**The Shan Dominion (1287–1531).**—Under the Shan irruption chaos supervened, and for two and a half centuries Burman history is a confused record of princes and upstarts, Talaings, Shans and Burmans constantly contending for the mastery, petty kingdoms rising and falling at Ava, in Pegu, at Toungoo, and in Arakan. Among the more famous of the Pegu kings was Razadarit (1385–1423), a man of blood and treachery. A daughter of his, Shinsawbu (1453–72) and Dammazedi, a monk who turned layman and married her daughter, ushered in a period of comparative peace, recorded as the Golden Age of Pegu. It was during this epoch that the famous Shwedagon Pagoda of Dagon (Rangoon) was twice heightened and enriched, but still barbarous practices continued. The dynasty was overthrown by the house of Toungoo in 1531, which re-established a Burmese kingdom.

**The Toungoo Dynasty.**—Toungoo began as a stronghold for Burmese refugees against Shans and Talaings alike in 1280, and was ruled by 28 chiefs in all, of whom 15 perished by assassination. The last of the house, Tabinshwehti (1531–50), with the aid of his brother-in-law, the famous general, Bayinnaung, captured Prome and Martaban, invaded Arakan, captured Pegu, attacked Siam, and was finally crowned at Ava, the Shan chiefs being ousted from Upper Burma. Bayinnaung (1551–81), who succeeded, had first to fight for his kingdom, then carry on a career of conquest. He captured the old Siamese capital of Ayutthia, subdued the Shan States and half Siam, and reigned over the whole of Burma, except Arakan. He exchanged missions with Bengal and Colombo, from whom he obtained a daughter and a sacred Tooth, but his enormous conscriptions of men and constant warfare reduced his own province almost to desolation. His son, Nandabayin, who followed in his footsteps, completed the ruin. The Siamese invaded Burma, and the Arakanese raided and burnt Pegu. The king was deposed and murdered, and for 16 years the kingdom was again split into petty States, some of which, including Ava, were retained by sons of Bayinnaung. A grandson of that monarch, Anauketun (1605–28) reconquered the de-populated south, sacked the port of Syriam, and impaled its Portuguese governor, de Brito. He restored the monarchy and set up his court at Pegu. He commanded both the terror and the admiration of his subjects. The successors of Anauketun retired to Ava, and the monarchy became increasingly effete, though Thalun (1629–48) was a patron of learning. For about a century a series of weaklings nominally reigned at Ava. During this period Upper Burma was twice over-run by the Ming and Manchu Chinese, and five times by the Manipuris. Ava's authority over Pegu constantly diminished until in 1740 the Talaings set up a king of their own, and in the course of ten years had over-run the country round Ava. Against this unnatural Talaing supremacy a leader was found in a headman of Shwebo, Alangpaya, who founded the last dynasty of Burmese kings.

**The Alangpaya Dynasty.**—Alangpaya (Alompra), beginning with the defeat of small bodies of troops sent to capture him was eventually able to establish himself as king. His energy was marvellous, for, though he reigned for eight years only (1752–60), in that brief period he had reconquered the whole country, captured Syriam, seized and sacked Pegu, defeated the Manipuris, completely subjugated the Talaings, established himself in Rangoon, and invaded Siam. The Talaings who survived fled to Siam, and the Delta was once more depopulated. While investing the Siamese capital, Ayutthia, for the fifth time in its history, he was stricken with illness, and, retiring by forced marches, died on the way.

**Early European contact with Burma.**—In the century that ended with Alangpaya the earliest European contact with Burma was that of the Portuguese, many of whom settled in the country and married Burmese wives. The Portuguese adventurer, de Brito, was left as governor of Syriam by the invading Arakanese, and Portuguese half-breeds formed contingents in some of the contending armies, these and Armenians being found in considerable numbers in the sea-ports. The British and Dutch East India Companies had branches in Burma under junior representatives from about 1627, but both of them withdrew some 50 years later. In 1709 the British re-established a factory at Syriam, which lasted till 1743, when the Talaings burnt it down, suspecting that the English were aiding the Burmese. The English factory was then moved to Negrais and it was there that the settlement and garrison were treacherously massacred in Alangpaya's reign in 1759, on the pretext that they had helped the Talaings. The company unsuccessfully sent Captain Alves as an envoy to demand redress.

When Dupleix sent two ships to save Syriam, besieged by Alangpaya, all the French officers were executed. The guns and the crews of the ships were a valuable accession to Alangpaya's military strength, and these European gunners were given a place of honour in his armies. There were many instances in which ships were seized and their crews enslaved. But in all these years the European Governments concerned were much too occupied

with other commitments to exact serious retribution for outrages against their subjects.

**Alangpaya's Successors.**—Alangpaya was succeeded by his eldest son, Naungdawgyi, who, after three years, was succeeded by his brother, Hsinbyushin (1763–76), who again made Ava the capital. He raided Manipur in person, carrying away thousands of its population into captivity, attacked Siam and eventually captured Ayutthia. This campaign was followed by a Chinese invasion, which the Burmese armies took four years to repel. A Siamese rising resulted in the Burmese being driven across the frontier. On the death of Hsinbyushin his son, Singu, reigned for six years only and was then murdered. The throne was seized by Bodawpaya (1782–1819), a son of the great Alangpaya, who shifted his capital to Amarapura, and annexed Arakan. He carried off 20,000 Arakanese into captivity, with the famous Mahamuni Buddha, which is now the Arakan pagoda at Mandalay. This subjugation was a contributory cause to the first Burmese war. The tyranny exercised over the defeated Arakanese, who were constantly dragged off in numbers to forced labour or military expeditions, provoked acts of rebellion entailing ruthless repression. Insurgent leaders took refuge in Chittagong and planned acts of war against the Burmese, leading to demands for their surrender as rebels. The indignities with which British envoys and missions to the Burma court were treated, merely served to increase the arrogance of the Burmese ruler. Manipur and Assam were once more over-run, and their inhabitants deported, enslaved or massacred. When Bodawpaya died, his dominion, except on the Siamese side, extended further than ever before. His grandson, Bagyidaw (1819–37) succeeded. The British Government in India were incredibly patient until in 1824, Burmese troops moved across over the Cachar frontier. In March, the viceroy notified a state of war and the first British transports arrived at Rangoon. This first Burmese war of 1824 was terminated by the Peace of Yandabu, the cession of Arakan and Tenasserim, the abandonment of all claims upon Assam and Manipur, and the payment by instalments of a crore of rupees. The two ceded territories were administered by commissioners as appanages of Bengal. The Yandabu Treaty provided for a resident at the court of Ava, but it was not till 1830 that Major Burney was sent there. Burney established some influence with the court, but was never properly received by the king. Bagyidaw became melancholy mad, and in 1837 was superseded by his brother, Tharawadi (1837–46). Although Tharawadi refrained from the usual massacre of kinsmen on his accession, in deference to Burney's exhortations, Burney's successors were treated ignominiously, and in 1840 the mission was withdrawn. A rebellion of the Shan States, mercilessly repressed, and a final uprising by the Talaings in Pegu, gave Tharawadi an excuse to return to the old atrocities. Before long he became so mad and outrageous in his doings that in 1845 his eldest son, Pagan Min, put him under restraint, and on his death succeeded to the throne (1846–53). Pagan Min was avaricious and immoral. The governor of Rangoon, Maung Ok, was notorious for his extortions. British ships having suffered greatly a small squadron was sent to Rangoon to demand redress and the removal of the governor. Pagan was defiant, and sent new governors with armies of several thousand men to Rangoon, Bassein and Martaban. British ships were fired upon, and Lord Dalhousie sent a stern ultimatum, expiring on April 1, 1852. No reply arriving, the second Burmese war began. The Burmese resistance was feeble, and on Dec. 20, 1852, Lord Dalhousie proclaimed the annexation of the Pegu province. In the meantime a revolution had taken place and Pagan had been deposed by his brother, Mindon Min (1853–78). The First Commissioner of Pegu, Captain, afterwards Sir Arthur Phayre, took a mission to Amarapura to negotiate a commercial treaty. He was received politely, but the treaty was not secured. In 1857 Mindon shifted his capital to Mandalay, and occupied himself with civil reforms, substituting salaries to officials for the periodical levies which were hitherto the custom. The salaries were seldom paid. In 1862 the several British territories were constituted the Province of British Burma, Phayre being the first chief commissioner. He succeeded in negotiating a commercial treaty, but the royal monopolies in which Mindon specialized stood

in the way and evasions became so notorious that Phayre's successor, Colonel Fytche, negotiated a second treaty, but without much practical effect. Mindon had two minor rebellions of princes to suppress, but in the absence of foreign wars devoted himself to pious works. He also sent a mission to Rome, Paris and London; treaties were concluded with Italy and France, the former being purely diplomatic, but the latter gave too many rights to France and Mindon refused to ratify it. Machinery was imported and a teak church was built for Dr. Marks (S.P.G. missionary). In comparison with his predecessors Mindon was a humane monarch, and when he died of dysentery in 1876 he was genuinely mourned by his subjects.

**Thebaw (1876–1885):—The End of the Burmese Monarchy.**—The last of the kings of Burma owed his selection to the ambition of the Alenandaw queen, a masterful and ferocious lady, whose daughter, the notorious Supyalat, he married. While Mindon was dying the rival princes had been treacherously arrested, and they were kept imprisoned for over two years. On Feb. 15, 1879, the usual massacre of princes began. Mandalay had by this time become an Alsatia for all sorts of foreign riff-raff, strongly anti-British in their ideas, who misled the court into thinking that the affair would blow over. For the time being action was not taken, but the cup was filling up, and in 1879, after various incidents of Burmese truculence against British subjects had occurred, the resident and his whole staff withdrew from Mandalay. Thebaw sent envoys to Thyatmyo in 1879, and another one to Simla in 1882, which he recalled. In the meantime Thebaw was intriguing with the French Consul, M. Haas, and contracts for a French Railway to Mandalay, and a French flotilla on the Irrawaddy, were actually signed. Disturbances broke out in various parts of Upper Burma, and a fresh massacre of political prisoners under cover of a bogus jail outbreak added to the excitement. The Bombay-Burma Trading Corporation were arbitrarily fined Rs. 230,000 for alleged breaches of contract. It was not until Oct. 1885, that an ultimatum was sent, to which Thebaw gave an evasive and defiant reply, issuing a Proclamation calling upon his subjects to unite and annihilate the English barbarians and conquer and annex their country. The British Expeditionary Force, under Sir Harry Prendergast, crossed the frontier on Nov. 4, proceeding up the Irrawaddy, and by the end of that month Thebaw and his family had been deported to India, and the kingdom of Burma had ceased to exist, annexation being proclaimed by Lord Dufferin on Jan. 1, 1886.

**Burma Under British Rule.**—Burma remained a chief commissionership under Sir Charles Bernard, Sir Charles Crosthwaite, Sir Alexander Mackenzie, and Sir Frederick Fryer, the last becoming the first lieutenant-governor, in 1897. He was followed by Sir Hugh Barnes, Sir Herbert Thirkell-White, and Sir Harvey Adamson. In 1915, Sir Harcourt Butler succeeded for two years, when he was translated to the United Provinces. Sir Reginald Craddock was the last lieutenant-governor, and on the completion of his term of office in 1922, Sir Harcourt Butler returned as the first governor under the new Constitution.

These successive changes in the status of the head of the province corresponded roughly with stages in the development of Burma. When Arakan and Tenasserim had been under British rule for 103 years, Pegu for 74, and Upper Burma for 42, Arakan and Tenasserim had been so reduced and depopulated that they gave but little trouble, Pegu took several years to pacify, and the pacification of Upper Burma was not completed until after five years, at first engaging the energies of 32,000 Regular troops. A force of military police 16,000 strong, half of which was recruited from India, was formed soon after the annexation, and the Chins on the north-west, and the Kachins on the north-east have occasionally given trouble by risings, the last of which occurred during the Great War. Perhaps never in the history of any country has the contrast between its past and its present been so great and so rapid.

Financial stringency first retarded progress, and the administrators of Burma long chafed against restrictions which Finance Ministers in India felt bound to impose. The civilizing influences of the impartial administration of justice, of communications by rail, river and road, of the wonderful development of trade, and the

direct humanizing effects of education, medical relief, and the labours of the great Christian missions, Catholic and Protestant, could not but produce a change in the outlook and life of the great majority of the Burmese people.

There have been boycotts of British goods, of the new Rangoon university and Government schools, echoes of Gandhi's Non-Co-operation movement, and agitations against payment of taxes, but these movements, with firm administration, have all subsided, though a section of "Nationalists" is still pressing for immediate home rule.

The early years of the new Constitution of Burma have passed without any special crisis, and among the features of this period have been the governor's efforts to suppress slavery and human sacrifices in the unadministered tracts of the Hukong Valley and the Kachin "Triangle." Burma enjoys wider franchise than the Indian provinces, women having the necessary property qualifications being enfranchised. Its effort in the Great War was remarkable, and four Battalions of Burmans were enrolled at that time, but the enthusiasm for soldiering dies away in peace-time, and the local battalions consist mainly of Karens, Chins and Kachins. The Burmese are a particularly cheerful and amusement-loving people, with pronounced artistic talents and love of beautiful things and bright colours. The reception accorded to the prince of Wales in 1922 was a most enthusiastic one, after an attempt, engineered from India, to boycott his visit had completely failed. The pagodas of Burma, her monasteries, and her emancipated womanhood appeal to the European, and make it difficult to believe that a country of such apparent sweetness and light can have so recently passed through a thousand years of tragedies and oppression.

See Dautremer, *Burma under British Rule* (trans. 1913); Sir C. Crosthwaite, *The Pacification of Burma* (1913); Sir H. T. White, *Burma* (1923).

**BURMAH OIL COMPANY LIMITED.** This, the greatest British petroleum company, had its origin in the oil works at Rangoon founded in 1871 by a Glasgow merchant. David Sime Cargill. From very small beginnings the undertaking has grown until in 1928 it had an issued capital of £10,868,000, standing at a heavy premium in the stock markets, and a direct net crude oil production in Burma of some 800,000 tons per annum, to say nothing of its interest in other oil lands in India and elsewhere.

The Burmese oil deposits have long been known, and were worked in a primitive way for possibly two centuries prior to 1871. The late Lord Curzon's saying that the Allies floated to victory on a sea of oil was by no means the earliest reference to the military uses of petroleum. We find that in the Burmese War of 1825 the native oil was used as a military weapon; we are told that the fire rafts then employed by the Burmese in their attack on British vessels in Rangoon harbour were "made of bamboos firmly fixed together, between every two or three of which lines of earthenware jars filled with petroleum and cotton were secured." It is also on record that in the early days of Mr. Cargill's enterprise, his refinery at Rangoon received its crude oil by this same method of rafts and jars floated down the river Irrawaddy from Zenangyoung to Rangoon.

The first machine-drilled oil well in Burma was completed in 1889. The growth since then may be gauged by the fact that during one month in 1928 seven times as much crude oil was handled by the company as during the whole year 1889.

Burma crude petroleum has the advantage that it requires little or no refining. It follows that the company is not a producer of fuel oil; Burma crude is relatively too limited in supply and too valuable to be sold at fuel oil prices.

It is notable that the company, in association with the Tata Iron and Steel Company, founded in India after the World War a successful native tin-plate industry. The risks were enormous, but technical success has been achieved, and production has reached over 800,000 boxes per annum; there is good reason to suppose that the industry will become permanent and a trade of great national importance established.

Returning to the company's primary product, its oil operations now give direct employment to over 40,000 people, the bulk of whom it houses and provides with medical and other services.

Hospitals and schools are run by the company in all its large centres of operation, and it has instituted provident funds and employees' profit-sharing schemes. (L. C. M.)

**BURMANN, PIETER** (1668-1741), Dutch classical scholar, known as "the Elder," was born at Utrecht. He studied at Utrecht and Leyden, and went to the bar, without, however, abandoning his classical studies. In 1696 he was nominated to the professorship of eloquence and history at Utrecht, and to this chair was soon added that of Greek and politics. In 1714 he visited Paris and ransacked the libraries. In the following year he was appointed to the chair of history, Greek language and eloquence at Leyden. He was subsequently appointed professor of history for the United Provinces and chief librarian. Burmann was rather a compiler than a critic; his commentaries show immense learning and accuracy, but are wanting in taste and judgment.

Burmann edited the following classical authors:—Phaedrus (1698), Horace (1699), Valerius Flaccus (1702), Petronius Arbiter (1709), Velleius Paterculus (1719), Quintilian (1720), Justin (1722), Ovid (1727), *Poetae Latini minores* (1731), Suetonius (1736), Lucan (1740). He also published an edition of Buchanan's works, continued Graevius's great work, *Thesaurus Antiquitatum et Historiarum Italiae*, and wrote a treatise *De Vectigalibus populi Romani* (1694), and a short manual of Roman antiquities, *Antiquitatum Romanarum Brevis Descriptio* (1711). His *Sylloge epistolarum a viris illustribus scriptarum* (1725) is of importance for the history of learned men. The list of his works occupies five pages in Saxe's *Onomasticon*. His poems and orations were published after his death. There is an account of his life in the *Gentleman's Magazine* for April (1742) by Dr. Johnson.

**BURMANN, PIETER** (1714-1778), called by himself "the Younger" (Secundus), Dutch philologist, nephew of Pieter Burmann (1668-1741) (q.v.), was born at Amsterdam on Oct. 13, 1714. In 1735 he was appointed professor of eloquence and history at Franeker, and the chair of poetry was combined with the professorship in 1741. In the year 1742 he became professor of history and philology at the Athenaeum in Amsterdam. He was subsequently professor of poetry (1744), general librarian (1752), and inspector of the gymnasium (1753). He died on June 24, 1778, at Sandhorst, near Amsterdam. He was a man of extensive learning. His violent disposition involved him in quarrels with contemporaries, notably Saxe and Klotz. His most valuable works are: *Anthologia Veterum Latinorum Epigrammatum et Poematum* (1759-73); *Aristophanis Comoediae Novem* (1760); *Rhetorica ad Herennium* (1761). He completed the editions of Virgil (1746) and Claudian (1760), which had been left unfinished by his uncle, and commenced an edition of Propertius, one of his best works, of which only half was printed at the time of his death. It was completed by L. van Santen and published in 1780.

**BURMESE BUDDHIST LAW:** see INDIAN LAW.

**BURMESE WARS.** Three wars were fought between Burma and the British during the 19th century (see BURMA: History), which resulted in the gradual extinction of Burmese independence.

**First Burmese War, 1823-26.**—On Sept. 23, 1823, an armed party of Burmese attacked a British guard on Shapura, an island close to the Chittagong side, killing and wounding six of the guard. Two Burmese armies, one from Manipur and another from Assam, also entered Cachar, which was under British protection, in Jan. 1824. War with Burma was formally declared on March 5, 1824. On May 17 a Burmese force invaded Chittagong and drove a mixed sepoy and police detachment from its position at Ramu, but did not follow up its success. The British rulers in India, however, had resolved to carry the war into the enemy's country; an armament, under Comm. Charles Grant and Sir Archibald Campbell, entered the Rangoon river, and anchored off the town on May 10, 1824. After a feeble resistance the place was surrendered, troops were landed, and the inhabitants fled. On May 28, Sir A. Campbell ordered an attack on some of the nearest posts, which were all carried after a steadily weakening defence. Another attack was made on June 10 on the stockades at the village of Kemmendine. Some of these were battered by artillery from the war vessels in the river, and the shot and shells had such effect on the Burmese that they evacuated them. The devastation of the country, which was part of the defensive system of the Burmese, was carried out with unrelenting rigour, and the invaders were soon reduced to great difficulties. The health of

the men declined, and their ranks were fearfully thinned. The monarch of Ava sent large reinforcements to his dispirited and beaten army; and early in June an attack was commenced on the British lines but proved unsuccessful. On the 8th the British assaulted. The enemy were beaten at all points; and their strongest stockaded works, battered to pieces by a powerful artillery, were in general abandoned. With the exception of an attack by the prince of Tharrawaddy in the end of August, the enemy allowed the British to remain unmolested during the months of July and August. This interval was employed by Sir A. Campbell in subduing the Burmese provinces of Tavoy and Mergui, and the whole coast of Tennasserim. This was an important conquest, as the country was salubrious and afforded convalescent stations to the sick, who were now so numerous in the British army that there were scarcely 3,000 soldiers fit for duty.

The rainy season terminated about the end of October; and the court of Ava, alarmed by the discomfiture of its armies, recalled the veteran legions which were employed in Arakan, under their renowned leader Maha Bandula. Bandula hastened by forced marches to the defence of his country; and by the end of November an army of 60,000 men had surrounded the British position at Rangoon and Kemmendine, for the defence of which Sir Archibald Campbell had only 5,000 efficient troops. The enemy in great force made repeated attacks on Kemmendine without success, and on Dec. 7 Bandula was defeated in a counter attack by Sir A. Campbell. The fugitives retired to a strong position on the river, but on the 15th were driven in confusion from the field.

Sir Archibald Campbell now resolved to advance on Prome, about 100m. higher up the Irrawaddy river. He moved with his force on Feb. 13, 1825, in two divisions, one proceeding by land, and the other, under Gen. Willoughby Cotton, destined for the reduction of Danubyu, being embarked on the flotilla. Taking the command of the land force, he continued his advance till March 11, when intelligence reached him of the failure of the attack upon Danubyu. He instantly commenced a retrograde march; on the 27th he effected a junction with Gen. Cotton's force, and on April 2 entered the entrenchments at Danubyu without resistance, Bandula having been killed by the explosion of a bomb. The English general entered Prome on the 25th and remained there during the rainy season. On Sept. 17 an armistice was concluded for one month. In the course of the summer Gen. Joseph Morrison had conquered the province of Arakan; in the north the Burmese were expelled from Assam; and the British had made some progress in Cachar.

The armistice having expired on Nov. 3, the army of Ava, amounting to 60,000 men, advanced in three divisions against the British position at Prome, which was defended by 3,000 Europeans and 2,000 native troops. Sir A. Campbell on Dec. 1 attacked the different divisions of the Burmese and successively drove them from all their positions. The Burmese retired on Malun, along the course of the Irrawaddy, where they occupied, with 10,000 or 12,000 men, a series of strongly fortified heights and a formidable stockade. On the 26th they sent a flag of truce to the British camp and negotiations having commenced, peace was proposed to them on the following conditions: (1) The cession of Arakan, together with the provinces of Mergui, Tavoy, and Ye; (2) the renunciation by the Burmese sovereign of all claims upon Assam and the contiguous petty states; (3) the Company to be paid a crore of rupees as an indemnification for the expenses of the war; (4) residents from each court to be allowed, with an escort of 50 men; while it was also stipulated that British ships should no longer be obliged to unship their rudders and land their guns as formerly in the Burmese ports. This treaty was agreed to and signed, but the ratification of the king was still wanting; and it was soon apparent that the Burmese had no intention to sign it, but were preparing to renew the contest. On Jan. 19, accordingly, Sir A. Campbell attacked and carried the enemy's position at Malun. Another offer of peace was here made by the Burmese, but it was found to be insincere; and the fugitive army made at the ancient city of Pagan a final stand in defence of the capital. They were attacked and overthrown on Feb. 9, 1826; and the invading force being now within four days' march of Ava, Dr.

Price, an American missionary, who with other Europeans had been thrown into prison when the war commenced, was sent to the British camp with the treaty (known as the treaty of Yandaboo) ratified, the prisoners of war released, and an instalment of 25 lakhs of rupees. The British army then evacuated the country.

**Second Burmese War, 1852.**—On March 15, 1852, Lord Dalhousie sent an ultimatum to King Pagan, announcing that hostile operations would be commenced if all his demands were not agreed to by April 1. Meanwhile a force consisting of 8,100 troops had been despatched to Rangoon under the command of Gen. H. T. Godwin, C.B., while Comm. Lambert commanded the naval contingent. No reply being given to this letter, the first blow of the second Burmese War was struck by the British on April 5, 1852, when Martaban was taken. Rangoon town was occupied on the 12th, and the Shwe Dagôn pagoda on the 14th, after heavy fighting, when the Burmese army retired northwards. Bassein was seized on May 19 and Pegu was taken on June 3 after some sharp fighting round the Shwe-maw-daw pagoda. During the rainy season the approval of the East India Company's court of directors and of the British government was obtained to the annexation of the lower portion of the Irrawaddy valley, including Prome. Lord Dalhousie visited Rangoon in July and August and discussed the whole situation with the civil, military, and naval authorities. In consequence, Gen. Godwin occupied Prome on Oct. 9 after but slight resistance. Early in December, Lord Dalhousie informed King Pagan that the province of Pegu would henceforth form part of the British dominions, and that if his troops resisted the measure his whole kingdom would be destroyed. The proclamation of annexation was issued on Jan. 20, 1853, and thus the Second Burmese War was brought to an end without any treaty being signed.

**Third Burmese War, 1885-86.**—The imposition of an impossible fine on the Bombay-Burma Trading Company, coupled with the threat of confiscation of all their rights and property in case of non-payment, led to the British ultimatum of Oct. 22, 1885; and by Nov. 9 a practical refusal of the terms having been received at Rangoon, the occupation of Mandalay and the dethronement of King Thibaw were determined upon. The British planned an advance by water direct on the capital, and Maj.-Gen. Prendergast had command of the expedition. As was only to be expected in an enterprise of this description, the navy as well as the army was called in requisition; and as usual the services rendered by the seamen and guns were most important. The total effective of the force was 9,034 fighting men, 2,810 native followers, and 67 guns, and for river service 24 machine guns.

Thayetmyo was the British post on the river nearest to the frontier, and here, by Nov. 14, five days after Thibaw's answer had been received, practically the whole expedition was assembled. On the same day Gen. Prendergast received instructions to commence operations. The Burmese king and his country were taken completely by surprise by the unexampled rapidity of the advance. There had been no time for them to collect and organize for the stubborn resistance of which the river and its defences were capable. They had not even been able to block the river by sinking steamers, etc., across it, for, on the very day of the receipt of orders to advance, the armed steamers "Irrawaddy" and "Kathleen" engaged the nearest Burmese batteries, and brought out from under their guns the king's steamer and some barges which were lying in readiness for this very purpose. On the 16th the batteries themselves on both banks were taken by a land attack, the enemy being evidently unprepared and making no resistance.

On Nov. 17, however, at Minhla, on the right bank of the river, the Burmans in considerable force held successively a barricade, a pagoda, and the redoubt of Minhla. The attack was pressed home by a brigade of native infantry on shore, covered by a bombardment from the river, and the enemy were defeated with a loss of 170 killed and 276 prisoners, besides many more drowned in the attempt to escape by the river. The advance was continued next day and the following days, the naval brigade and heavy artillery leading and silencing in succession the enemy's river defences at Nyaungu, Pakôkku, and Myingyan. On Nov. 26, when the flotilla was approaching the ancient capital of Ava,

envoys from King Thibaw met Gen. Prendergast with offers of surrender; and on the 27th, when the ships were lying off that city and ready to commence hostilities, the order of the king to his troops to lay down their arms was received. There were three strong forts here, full at that moment with thousands of armed Burmans, and though a large number of these filed past and laid down their arms by the king's command, many more were allowed to disperse with their weapons; and these, in the time that followed, broke up into dacoit or guerrilla bands, which became the scourge of the country and prolonged the war for years. Meanwhile, however, the surrender of the king of Burma was complete; and on Nov. 28, in less than a fortnight from the declaration of war, Mandalay had fallen, and the king himself was a prisoner, while every strong fort and town on the river, and all the king's ordnance (1,861 pieces) and thousands of rifles, muskets, and arms had been taken.

From Mandalay, Gen. Prendergast seized Bhamo on Dec. 28. This was a very important move, as it forestalled the Chinese, who were preparing to claim the place. But unfortunately, although the king was dethroned and deported, and the capital and the whole of the river in the hands of the British, the bands of armed soldiery, unaccustomed to conditions other than those of anarchy, rapine, and murder, took advantage of the impenetrable cover of their jungles to continue a desultory armed resistance. Reinforcements had to be poured into the country, and it was in this phase of the campaign, lasting several years, that the most arduous work fell to the lot of the troops. The final pacification of the country, under the direction of Sir Frederick (afterwards Earl) Roberts, was only brought about by an extensive system of small protective posts scattered all over the country, and small lightly equipped columns moving out to disperse the enemy.

No account of the third Burmese War would be complete without a reference to the first, and perhaps for this reason most notable, land advance into the enemy's country. This was carried out in Nov. 1885 from Toungoo, the British frontier post in the east of the country, by a small column of all arms under Col. W. P. Dicken, 3rd Madras Light Infantry, the first objective being Ningyan. The operations were completely successful, in spite of a good deal of scattered resistance, and the force afterwards moved forward to Yamethin and Hlaingdet. As inland operations developed, the want of mounted troops was badly felt, and several regiments of cavalry were brought over from India, while mounted infantry was raised locally.

**BURMU:** see HAMEG.

**BURN, RICHARD** (1709-1785), English legal writer, was born at Winton, Westmorland, and died at Orton on Nov. 12, 1785. Educated at Queen's College, Oxford, he entered the Church, became (1736) vicar of Orton in Westmorland, and chancellor of the diocese of Carlisle (1765). Burn's *Justice of the Peace and Parish Officer* (1755) has passed through innumerable editions. His *Ecclesiastical Law* (1760), was the basis of many modern commentaries on ecclesiastical law. The best edition is that by R. Phillimore (1842). Burn also wrote *Digest of the Militia Laws* (1760) and *A New Law Dictionary* (1792).

**BURNABY, FREDERICK GUSTAVUS** (1842-1885), English traveller and soldier, was born on March 3, 1842, at Bedford, the son of a clergyman. Educated at Harrow and in Germany, he entered the Royal Horse Guards in 1859. In the summer of 1874 he accompanied the Carlist forces as correspondent of *The Times*, but before the end of the war he was transferred to Africa to report on Gordon's expedition to the Sudan. This took Burnaby as far as Khartum. Returning to England in March 1875, he matured his plans for a journey on horseback to Khiva through Russian Asia, which had just been closed to travellers. His accomplishment of this task, in the winter of 1875-76, described in his book *A Ride to Khiva*, brought him immediate fame. His next leave of absence was spent in another adventurous journey on horseback, through Asia Minor, from Scutari to Erzerum, with the object of observing the Russian frontier, an account of which he afterwards published. In the Russo-Turkish War of 1877, Burnaby (who soon afterwards became lieutenant-colonel) acted as travelling agent to the Stafford House (Red

Cross) Committee, but had to return to England before the campaign was over. In 1882 he crossed the Channel in a balloon. Having been disappointed in his hope of seeing active service in the Egyptian campaign of 1882, he participated in the Suakin campaign of 1884 without official leave, and was wounded at El Teb when acting as an intelligence officer under General Valentine Baker. He was employed by Lord Wolseley in the Nile Expedition, and met his death in the hand-to-hand fighting of the battle of Abu Klea (Jan. 17 1885).

See R. K. Mann, *The Life of F. G. Burnaby* (1882); T. Wright, *The Life of Colonel Fred Burnaby* (1908).

**BURNAND, SIR FRANCIS COWLEY** (1836-1917), English humorist, was born in London. He was educated at Eton and Cambridge, and originally studied first for the Anglican, then for the Roman Catholic Church; but eventually took to the law and was called to the bar. He had founded the Amateur Dramatic club at Cambridge and finally he abandoned the church and the law, first for the stage and subsequently for dramatic authorship. His first great dramatic success was made with the burlesque *Black-Eyed Susan* (1866), and he wrote a large number of other burlesques, comedies and farces. Burnand became in 1862 a regular contributor to *Punch*; in 1880 he was appointed editor and only retired from that position in 1906. In 1902 he was knighted. His literary reputation as a humorist depends, apart from his long association with *Punch*, on his well-known book *Happy Thoughts*, originally published in *Punch* in 1863-64 and frequently reprinted. See his *Records and Reminiscences* (1904).

**BURNE-JONES, SIR EDWARD BURNE, BART.** (1833-1898), English painter and designer, was born Aug. 28 1833, at Birmingham. He was educated at King Edward's school, Birmingham, and Exeter college, Oxford, where William Morris was his contemporary. With Morris he read *Modern Painters* and the *Morte d'Arthur*. He studied the Italian pictures in the university galleries and Dürer's engravings; but his keenest enthusiasm was kindled by the sight of two works by a living man, Rossetti. One of these was a woodcut in Allingham's poems, "The Maids of Elfinmere"; the other was the water-colour "Dante drawing an Angel," then belonging to Mr. Coombe, of the Clarendon Press, and now in the university collection. At Easter 1856 he left college without taking a degree. This was his own decision, not due (as often stated) to Rossetti's persuasion; but on settling in London, where Morris soon joined him at 17 Red Lion square, he began to work under Rossetti's friendly instruction.

In 1859 Burne-Jones made his first journey to Italy. He saw Florence, Pisa, Siena, Venice and other places, and appears to have found the gentle and romantic Sieneese more attractive than any other school. Rossetti's influence still persisted; and its impress is visible, more strongly perhaps than ever before, in the two water-colours "Sidonia von Bork" and "Clara von Bork," painted in 1860. These little masterpieces have a directness of execution rare with the artist. In powerful characterization, combined with a decorative motive, they rival Rossetti at his best. In June of this year Burne-Jones married Miss Georgiana MacDonald, two of whose sisters were the wives of Sir E. Poynter and Mr. J. L. Kipling. They lived first in Bloomsbury, then in Kensington square, then at the Grange, Fulham. In 1862 the artist and his wife accompanied Ruskin to Italy.

Burne-Jones exhibited from 1864 to 1887 at the Society of Painters in Water-Colours. Between 1870 and 1877 he showed only two water-colours (at the Dudley gallery), but he was working hard on a number of large pictures in oils. At the first exhibition of the Grosvenor gallery, he exhibited the "Days of Creation," "The Beguiling of Merlin," and "The Mirror of Venus." His reputation was now made. In 1878 he exhibited several canvases, and in 1879 the "Annunciation," quieter in colouring, in 1884 "Cophetua and the Beggar Maid," in 1886 "The Depths of the Sea," and in 1891 "The Star of Bethlehem," commissioned by the corporation of Birmingham. He had been elected A.R.A. in 1885, but resigned in 1893. He was occupied with various decorative series, the most famous of which was perhaps "The Briar Rose," and in 1892-93 produced some portraits. He received a baronetcy in 1894. He died on June 17 1898. His son and successor in the

baronetcy, Sir Philip Burne-Jones (d. June 21, 1926), also became an artist. His only daughter, Margaret, married Mr. J. W. Mackail.

Burne-Jones's influence has been exercised far less in painting than in the wide field of decorative design. Here it has been enormous. His first designs for stained glass, 1857-61, were made for Messrs. Powell, but after 1861 he worked exclusively for Morris & Co. Windows executed from his cartoons are to be found all over England; others exist in churches abroad. For the American Church in Rome he designed a number of mosaics. Reliefs in metal, tiles, gesso-work, decorations for pianos and organs, and cartoons for tapestry represent his manifold activity. In works, however, which were only designed and not carried out by him, a decided loss of delicacy is to be noted. The colouring of the tapestries (of which the "Adoration of the Magi" at Exeter college is the best known) is more brilliant than successful. The range and fertility of Burne-Jones as a decorative inventor can be, perhaps, most conveniently studied in the sketch-book, 1885-95, which he bequeathed to the British Museum. The artist's influence on book-illustration must also be recorded. In early years he made a few drawings on wood for Dalziel's Bible and for *Good Words*; but his later work for the Kelmscott Press, founded by Morris in 1891, is that by which he is best remembered. Besides several illustrations to other Kelmscott books, he made 87 designs for the *Chaucer* of 1897.

**BIBLIOGRAPHY.**—In 1904 was published *Memorials of Edward Burne-Jones*, by his widow, two volumes of extreme interest and charm. *The Work of Burne-Jones*, a collection of 91 photogravures, appeared in 1900.

See also Julia Cartwright (Mrs. Ady), *Sir E. Burne-Jones, his Life and Work* (1894); Malcolm Bell, *Sir E. Burne-Jones: a Record and a Review* (1898); J. W. Mackail, *The Life of William Morris* (1899); *Catalogue to Burlington Club Exhibition of Drawings by Burne-Jones*, with introduction by Cosmo Monkhouse (1899).

**BURNELL, ARTHUR COKE** (1840-1882), English Sanskrit scholar, was born at St. Briavels, Gloucestershire, in 1840. In 1860 he went to Madras as a member of the Indian civil service. Here he utilized every opportunity to acquire or copy Sanskrit manuscripts. In 1870 he presented his collection of 350 mss. to the India library. In 1874 he published a *Handbook of South Indian Palaeography*, characterized by Max Müller as "indispensable to every student of Indian literature," and in 1880 issued for the Madras Government his greatest work, the *Classified Index to the Sanskrit mss. in the Palace at Tanjore*. He also translated and commented on many other Sanskrit manuscripts, being particularly successful in elucidating the essential principles of Hindu law. Burnell originated with Sir Henry Yule, the well-known dictionary of Anglo-Indian words and phrases, *Hobson-Jobson* (1886). He broke down under the strain of overwork and the Madras climate, and died at West Stratton, Hampshire, on Oct. 12, 1882. A further collection of Sanskrit manuscripts was purchased from his heirs by the India library after his death.

**BURNELL, ROBERT** (d. 1292), English bishop and chancellor, was born at Acton Burnell in Shropshire, and began his public life probably as a clerk in the royal chancery. He was soon in the service of Edward, the eldest son of King Henry III., and was constantly in attendance on the prince. Having received some ecclesiastical preferments, he acted as one of the regents of the kingdom from the death of Henry III. in Nov. 1272 until Aug. 1274, when the new king, Edward I., returned from Palestine and made him his chancellor. In 1275 Burnell was elected bishop of Bath and Wells. As the friend and chief adviser of Edward I., Burnell influenced the legislative and foreign policy of his master. In 1283 a council, or, as it is sometimes called, a parliament, met in his house at Acton Burnell, and he was responsible for the settlement of the court of chancery in London. Licentious and avaricious, he amassed great wealth; and when he died on Oct. 25, 1292, he left numerous estates in Shropshire, Worcestershire, Somerset, Kent, Surrey and elsewhere. He was, however, genial and kind-hearted, a great lawyer and a faithful minister.

See R. W. Eyton, *Antiquities of Shropshire* (1854-60); and E. Foss, *The Judges of England* (1848-64).

**BURNES, SIR ALEXANDER** (1805-1841), British traveller and explorer, was born at Montrose, Scotland, on May 16, 1805. He joined the army of the East India Company at 17, and in 1822 became interpreter at Surat. Transferred to Cutch in 1826 as assistant to the political agent, he turned his attention to the history and geography of north-western India and the adjacent countries. In 1831 he was sent to Lahore with a present of horses from King William IV. to Maharaja Ranjit Singh and made extensive investigations. Next year he started from Lahore, disguised as an Afghan, and made his way across Afghanistan to Balkh, from there to Bukhārā, Asterabad and Teheran, and across Persia to Bushire, where he embarked for England. His *Travels to Bokhara* (1834) brought him acknowledgment from the geographical societies of London and Paris, and were widely read. After his return to India he undertook (1836) a political mission to Dost Mohammed at Kabul. He advised Lord Auckland to support Dost Mohammed on the throne of Kabul, but the viceroy reinstated Shah Shuja. On the restoration of Shah Shuja in 1839, he became regular political agent at Kabul. He was assassinated on Nov. 2, 1841. In 1861 it was found that some Burnes' despatches from Kabul in 1839 had been altered, so as to convey opinions opposite to his, but Lord Palmerston refused after such a lapse of time to grant the inquiry demanded in the House of Commons. A narrative of his Afghan experiences is given in his posthumously published *Cabool* (1842).

See Sir J. W. Kaye, *Lives of Indian Officers* (1889).

**BURNET, GILBERT** (1643-1715), English bishop and historian, was born in Edinburgh on Sept. 15, 1643, the youngest son of Robert Burnet (1592-1661), afterwards Lord Crimond. Robert Burnet had been twice exiled on account of his refusal to sign the Covenant, but he was none the less a severe critic of the government of Charles I. and his attitude certainly influenced his son. Gilbert Burnet was educated at Marischal college, Aberdeen, and in 1661 became a probationer for the Scottish ministry. In that year his father died, and Gilbert was offered a benefice which he declined on account of the unsettled state of Church affairs. He now visited Oxford and Cambridge, and after six months' absence returned to Scotland. He again refused offers of preferment and went to Holland and France. In Amsterdam he studied Hebrew and met Protestant divines of all shades of opinion, and in Paris he also met the leading Protestant ministers.

On his return to England in 1664 he became intimate with Sir Robert Moray and with John Maitland, afterwards duke of Lauderdale, both of whom at that time favoured leniency towards the Scottish Covenanters. While he was in London Burnet also became a member of the newly established Royal Society. During his absence abroad the living of Saltoun, East Lothian, had been kept open for him, and he began his ministrations there in Oct. 1664. In 1669 he resigned his parish to become professor of divinity in the University of Glasgow. He had already begun to differ from Lauderdale, who was moving in the direction of repression, and became Leighton's right hand in the attempt to secure a compromise between episcopacy and presbyterianism. He had on his side Anne, duchess of Hamilton, on whose behalf he edited *Memoirs of the Lives and Actions of James and William, dukes of Hamilton and Castleherald* . . . (London, 1676). Meanwhile, he had married an heiress, Lady Margaret Kennedy, daughter of the 6th earl of Cassilis and a cousin of Lauderdale. He renounced all claim to his wife's fortune, and the marriage itself was kept secret for three years.

The ascendancy of Lauderdale in Scotland induced Burnet to settle in England. He went up to London in 1673 to arrange for the publication of the *Hamilton Memoirs* and on his return to Scotland found that Lauderdale would not see him and had denounced him to Charles II. as a centre of Scottish discontent. Burnet returned to London and resigned his professorship at Glasgow. He had been appointed one of the court chaplains, but Charles II. struck him off the roll. He became, however, chaplain to the Rolls Chapel, and was elected lecturer at St. Clement's. Up to April 1675 he had enjoyed the favour of the duke of York, who was, however, alienated when Burnet gave evidence before a committee of the House of Commons against Lauderdale.

He presently began the preparation of his *History of the Reformation in England*. This book was prepared from the original sources, but unfortunately Burnet was denied access to the Cotton library, possibly through Lauderdale's influence. The first volume was published in 1679, the second in 1681, and the third in 1715. During the agitation about the popish plot in 1678 he acted with moderation and tried to save at least one of the victims, William Staly. He proposed a compromise in place of the Exclusion bill, a course which led to a very brief reconciliation with the court. He was known to have received the confidence of Wilmot, earl of Rochester, before his death, and he attended Lord Russell on the scaffold; further, against his own wish, it is true, he preached the usual anti-Catholic sermon on Guy Fawkes day (1684). He was consequently deprived of his appointments by order of the court, and on the accession of James II. retired to Paris, and eventually to The Hague, where he took the precaution of naturalizing himself as a Dutch subject, by way of protection against a prosecution for high treason threatened in England. His first wife was now dead, and he married a Dutch heiress of Scottish descent, Mary Scott.

Burnet was able to render great service to William, prince of Orange, because of the confidence placed in him by Princess Mary. He persuaded the princess to offer to leave the whole political power in her husband's hands in the event of their joint succession to the English crown. At the revolution he returned to England with William and Mary, and the English text of their declaration was drawn up by him. On his own account he published an *Inquiry into the Measures of Submission to the Supreme Authority*, defending the revolution. For these services he was rewarded by the see of Salisbury, and was consecrated on March 31, 1689, by a commission of bishops, Archbishop Sancroft having declined personally to perform the office. Burnet commanded the confidence of Queen Mary, and after her death William III. appointed an ecclesiastical commission, of which Burnet was a prominent member, for the disposal of vacant benefices, which had been personally supervised by Mary during her lifetime. The provision for the poorer livings afterwards carried out by the measure known as Queen Anne's Bounty was originally a proposal made by Burnet. He became tutor (1699) to Princess Anne's son, the duke of Gloucester, but his influence at court declined after Queen Mary's death, and disappeared after the accession of Queen Anne.

From 1685 onwards Burnet had been employed on his *History of His Own Time*, but he had from time to time written pamphlets in defence of the Broad Church position. Of these, probably the most important was his *Exposition of the Thirty-nine Articles* (1699) which was intended to pave the way for the re-admission of Nonconformists to the Church of England, and which gave great offence to the High Church clergy. His *History of His Own Time* was, by his direction, not published until six years after his death. Even then, the work (2 vols. 1724-34) appeared with some omissions made by his sons, Gilbert and Thomas. Burnet has frequently been charged with misrepresentation, notably in his account of the birth of James, the old Pretender. The most valuable part of his work is naturally that relating to transactions of which he had personal knowledge, notably the Church history of Scotland and the events leading up to the revolution.

Burnet's second wife died in 1698, and in 1700 he married Elizabeth Berkeley, the author of *A Method of Devotion*, posthumously published in 1710. Of his children by his second wife, William (d. 1720) became a colonial governor in America; Gilbert (d. 1726) became prebendary of Salisbury in 1715, and chaplain to George I. in 1718; and Sir Thomas (1694-1753), his literary executor and biographer, became in 1741 judge in the court of common pleas.

**BIBLIOGRAPHY.**—The chief authorities for Bishop Burnet's life are the autobiography "Rough Draft of my own Life" (ed. H. C. Foxcroft, 1902, in the *Supplement to Burnet's History*), the life by Sir Thomas Burnet in the *History of His Own Time*, vol. vi. (1823), and the *History* itself. A rather severe but detailed and useful criticism is given in L. v. Ranke's *History of England*, vol. vi. pp. 45-101 (Eng. ed., 1875). Burnet's letters to his friend, George Savile, marquess of Halifax, were published by the Royal Historical Society (*Camden Miscellany*, vol. xi.). The *History of His Own Time* (fol., 1724-34)

ran through many editions before it was reprinted at the Clarendon Press (1823), and supplementary volume (1833), with the suppressed passages of the first volume and notes by the earls of Dartmouth and Hardwicke, with the remarks of Swift. This edition, under the direction of M. J. Routh, was enlarged in a second Oxford edition of 1833. A new edition, based on this, but making use of the Bodleian ms., which differs very considerably from the printed version, was edited by Osmund Airy (1897, etc.). In 1902 (Clarendon Press) Miss H. C. Foxcroft edited *A Supplement to Burnet's History of His Own Time*, to which is prefixed an account of the relation between the different versions of the *History*—the Bodleian ms., the fragmentary Harleian ms. in the British Museum and Sir Thomas Burnet's edition; the book contains the remaining fragments of Burnet's original memoirs, his autobiography, his letters to Admiral Herbert and his private meditations. His *History of the Reformation of the Church of England* was edited (Clarendon Press, 1865) by N. Pocock.

See also *A Life of Gilbert Burnet, Bishop of Salisbury* (1907), by T. E. S. Clarke and H. C. Foxcroft, with an introduction by C. H. Firth, which contains a chronological list of Burnet's published works. Of Burnet's personal character there are well-known descriptions in chapter vii. of Macaulay's *History of England*, and in W. E. H. Lecky's *History of England in the Eighteenth Century*.

**BURNET, JOHN** (1863-1928), Scottish classical scholar, was born at Edinburgh Dec. 6, 1863. Educated at Balliol college, Oxford, he was successively assistant professor of Greek at St. Andrews (1887), assistant master at Harrow (1888-90), and Fellow of Merton college, Oxford, until 1892, when he became professor of Greek at St. Andrews.

His *Early Greek Philosophy* (1892, 3rd. ed. 1920), is important as being the first historical treatment of the pre-Socratics and the first study of the relation between Greek science and early Greek philosophy. He next edited Aristotle's *Ethics* (1899) and the *Dialogues* of Plato (1900-07). In his edition of the *Phaedo* (1911) he set forth his theory, later developed in *Greek Philosophy: Thales to Plato* (1914), that Plato's own doctrines were not put into the mouth of Socrates but are discoverable in the later dialogues, where Socrates occupies a less important position, and in Aristotle's works. The companion volume to the *Phaedo* includes the *Euthyphro*, the *Apology* and the *Crito* (1924). Burnet's shorter publications include *Higher Education and the War* (1917). He died at St. Andrews on May 26, 1928.

**BURNET, THOMAS** (1635-1715), English divine, was born at Croft in Yorkshire about the year 1635. He was educated at Northallerton, and at Clare Hall, Cambridge, and became master of the Charterhouse in 1685. As master he made a noble stand against the illegal attempts to admit Andrew Popham as a pensioner of the house.

Burnet published his famous *Telluris Theoria Sacra*, or *Sacred Theory of the Earth*, in London in 1681. This work, containing a fanciful theory of the earth's structure, attracted much attention, and he was afterwards encouraged to issue an English translation, which was printed in folio, 1684-89. In 1692 he published *Archaeologiae Philosophicae: sive Doctrina antiqua de Rerum Origimibus*, in which he treated the Mosaic account of the fall of man as an allegory. This excited a great clamour against him; and the king was obliged to remove him from the office of clerk of the closet which Archbishop Tillotson had procured for him. Of this book an English translation was published in 1729. Burnet died at the Charterhouse on Sept. 27, 1715.

Two posthumous works appeared several years after his death—*De Fide et Officiis Christianorum* (1723), and *De Statu Mortuorum et Resurgentium Tractatus* (1723); in which he maintained the doctrine of a middle state, the millennium, and the limited duration of future punishment.

*A Life of Dr. Burnet*, by Heathcote, appeared in 1759.

**BURNET**, the name given to various species of *Poterium*, a genus of the rose family. The plants are perennial herbs with pinnate leaves and small flowers arranged in dense long-stalked heads. Great burnet (*Poterium officinale*) is found in damp meadows; salad burnet (*P. Sanguisorba*) is a smaller plant growing in dry pastures.

**BURNETT, FRANCES ELIZA HODGSON** (1849-1924), Anglo-American novelist, was born in Manchester, England, Nov. 24, 1849. With her family she moved to Knoxville, (Tenn.), in 1865, marrying in 1873 Dr. L. M. Burnett of Washington, whom she divorced in 1898. A prolific writer for children and adults from her girlhood, she first won recognition by her

tale of Lancashire life, *That Lass o' Lowrie's* (1877). Other favourites by her were *Through One Administration* (1883), *A Lady of Quality* (1896), *The Dawn of a To-morrow* (1906), *The Shuttle* (1907), *T. Tembarom* (1913), and *The Head of the House of Coombe* (1922), pleasantly romantic stories. Perhaps her most popular creation was the title character of *Little Lord Fauntleroy* (1886), whose charming manners and picturesque garb provided an uncomfortable model for small boys for a generation. The dramatization of *Little Lord Fauntleroy* and of *Sara Crewe* (1888) as *The Little Princess* made her best known on the stage. She was the author of several plays in two of which she collaborated with her second husband, Stephen Townsend, an English surgeon. She died Oct. 29, 1924, at Plandome, Long Island.

*One I Knew the Best of All* (1904) is autobiographical. See also Vivian Burnett's, *The Romantick Lady* (1928).

**BURNEY, CHARLES** (1726–1814), English musical historian, was born in Shrewsbury on April 12, 1726. His first music-master was Edmund Baker, organist of Chester cathedral, and a pupil of Dr. John Blow, and later he went to London as a pupil of the celebrated Dr. Arne, with whom he remained three years. In 1749 he was appointed organist of St. Dionis-Backchurch, Fenchurch street, with a salary of £30 a year; and he was also engaged to take the harpsichord in the "New Concerts" then recently established at the King's Arms, Cornhill. In that year he married Miss Esther Sleepe, who died in 1761; in 1769 he married Mrs. Stephen Allen of Lynn. Threatened with consumption, he went in 1751 to Lynn in Norfolk, where he was elected organist, with an annual salary of £100, and there he resided for the next nine years. During that time he began to entertain the idea of writing a general history of music. His *Ode for St. Cecilia's Day* was performed at Ranelagh gardens in 1759, and in 1760 he returned to London.

Amidst his various professional avocations, Burney never lost sight of his favourite object, his *History of Music*, and therefore resolved to travel abroad for the purpose of collecting materials that could not be found in Great Britain. Accordingly he left London in June 1770, and proceeded to Paris, and thence to Geneva, Turin, Milan, Padua, Venice, Bologna, Florence, Rome and Naples to collect material for his projected history of music. The first results of his observations he published in *The Present State of Music in France and Italy* (1771). In July 1772 Burney visited the Continent, to collect further materials, and after his return to London the result appeared under the title of *The Present State of Music in Germany, the Netherlands and United Provinces* (1773). In 1773 he was chosen a fellow of the Royal Society and in 1776 appeared the first volume of his long-projected *History of Music*, the remaining three volumes following some years later. The least satisfactory volume is the fourth, the treatment of Handel and Bach being quite inadequate, and the whole work was severely criticized abroad, though it constituted a notable achievement for its day.

Other works by Dr. Burney are *A Plan for a Music School* (1774), *Memoirs and Letters of Metastasio* (1796) and *An Essay towards a History of Comets* (1769). He first published in England the music performed at the Vatican in Passion Week. In 1783 Edmund Burke's influence obtained for him the appointment of organist to Chelsea hospital, and Fox procured him a pension of £300 a year in 1806. He died at Chelsea on April 12, 1814.

Burney's portrait was painted by Reynolds, and his bust was cut by Nollekens in 1805.

Dr. Burney's eldest son, James, was a distinguished officer in the royal navy, who died a rear-admiral in 1821; his second son was the Rev. Charles Burney, D.D. (1757–1817), a well-known classical scholar, whose splendid collection of rare books and mss. was ultimately bought by the nation for the British Museum; and his second daughter was Frances (Madame d'Arblay, *q.v.*). The *Diary* and letters of Madame d'Arblay contain many minute and interesting particulars of her father's public and private life, and of his friends and contemporaries. A life of Burney by Madame d'Arblay appeared in 1832.

**BURNEY, FANNY:** see D'ARBLAY, FRANCES.

**BURNHAM, DANIEL HUDSON** (1846–1912), American architect, was born at Henderson (N.Y.) Sept. 4, 1846. He was educated at Chicago and at Waltham (Mass.). He worked as an architect in Chicago, and in 1871 formed a partnership with John W. Root. They were entrusted with the planning of the Chicago world's fair (1893). On the death of Root this work fell wholly upon Burnham. In 1894 he was elected president of the American institute of architects. His success with the Chicago world's fair buildings soon led to his being called upon to design other large structures, including the rookery and railway exchange in Chicago; the flatiron building and new Wanamaker's store in New York; the Pennsylvania railroad station in Pittsburgh; Filene's store in Boston; the Union station in Washington, and Selfridge's stores, London. He also was asked to propose plans for improving several cities, including Cleveland, San Francisco, Chicago, and Baltimore. In 1905 he was asked by the U.S. Government to design plans for cities in the Philippines, including Manila. He was made chairman of the national committee appointed for beautifying Washington (D.C.). He died in Heidelberg, Germany, on June 1, 1912.

**BURNHAM, EDWARD LEVY LAWSON**, 1ST BARON (1833–1916), English newspaper proprietor, was born in London Dec. 28, 1833, and died on Jan. 9, 1916. He was educated at University College school. His father, Joseph Moses Levy (d. 1888), acquired *The Daily Telegraph and Courier* in 1855, a few months after it had been founded by Col. Sleight, and, aided by his son, soon changed the current of its fortunes, raising it to a leading position among the London dailies, of which it was the pioneer penny paper. Edward Levy (he took the added name of Lawson under his uncle Lionel Lawson's will in 1875) acted as editor of *The Daily Telegraph* till his father's death and then became its managing proprietor and sole controller till 1903, when he was made a baron and passed over these duties to his son. He had received a baronetcy in 1892.

For many years Edward Lawson was one of the outstanding figures in English journalism. No one in Great Britain did more than he to brighten and humanize the daily newspaper and transform it from a plain, severe chronicle of the day's events (only mitigated by the occasional ferocity of its political judgments) into a readable and entertaining presentation of the world's news. The abolition of the last of the paper duties in 1861, in which Edward Lawson himself bore an active part, called into being a host of fresh newspaper readers among the middle classes, which welcomed the popular features of the new journalism. Edward Lawson's conception of a popular daily paper was that it should be a faithful mirror of the times and make a strong appeal to the sentiment and the emotion of its readers. Under his direction *The Daily Telegraph* raised many large funds for various national, patriotic and charitable objects, despatched missions of exploration and discovery to Central Africa and elsewhere, and started many novel features, such as popular correspondences on live topics of the day, which have since become the established commonplace of journalism. For many years *The Daily Telegraph* warmly supported the Liberal party, but it strongly dissented from Mr. Gladstone's anti-Turkish policy and the final severance came on his Irish policy of Home Rule. Edward Lawson was not by nature a strong political partisan; what interested him most was the social advancement of the people, and the development of the British Empire, to which causes he gave strong support, whatever the politics of the government of the day.

He was more than once president of the Institute of Journalists and the Newspaper Press Fund, and in 1909 presided over the first Imperial Press Conference in London. He married Henriette Georgiana (d. 1897), daughter of the actor-manager, Benjamin Webster (*q.v.*). (J. B. F.)

**BURNHAM, HARRY LAWSON WEBSTER LAWSON**, 1ST VISCOUNT (1862– ), eldest son of the 1st Baron Burnham, was born in London, Dec. 18, 1862, and educated at Eton and Balliol college, Oxford. He represented, as a Liberal, West St. Pancras from 1885 to 1892, East Gloucestershire from 1893 to 1895, and the Mile End division of the Tower Hamlets

from 1905 to 1906, and again, but this time as a Unionist, from 1910 to 1916, when he succeeded to his father's title. He also served on the London County Council from 1889 to 1892, and from 1897 to 1904, and was mayor of Stepney in 1908 and 1909.

In 1903, when his father retired from the active duties of the managing proprietorship of *The Daily Telegraph*, the Hon. Harry Lawson, as he then was, became the sole director of the conduct and policy of that newspaper. These duties, however, did not prevent him from devoting a large share of his time to public work. Lord Burnham was a member of the committee which drafted the Reform act of 1918, and of Lord Bryce's committee on the problem of the reform of the powers and constitution of the second chamber. He has been a chairman or a member of innumerable committees, commissions, conciliation boards, etc. In the year 1921 he was unanimously elected president of the International Labour Conference of the League of Nations at Geneva and was re-elected to the same post in the following year. Lord Burnham presided over the standing joint committees on the salaries of teachers, and made an award on the proposed new scales of payment. The Burnham scales, as they are universally called, received the support of the teachers, the local authorities, and the Ministry of Education, and when they came up for revision in 1924, Lord Burnham was again asked to undertake the task.

During these years of parliamentary and public activity he gave the closest attention to the direction of *The Daily Telegraph* (which he sold at the end of 1927), and was prominent in the various organizations of the newspaper press. He succeeded his father as president of the Newspaper Press Fund and the News-vendors' Benevolent Institution. In 1910 he was president of the Institute of Journalists, chairman of the Newspaper Proprietors' Association from its foundation, during the World War he was chairman of the Press Conference, to which the Government consigned the responsible duty of the regulation of news. Lord Burnham succeeded his father as president of the Empire Press Union and presided over the National Press conferences in Canada in 1920 and in Australia in 1925. In 1917 Lord Burnham was made a companion of honour and in 1919 a viscount. He married in 1884, Olive, daughter of Sir Henry de Bathe, bart., and he has one daughter. The heir to the barony is his brother, Col. the Hon. William Arnold Webster Lawson (b. 1864).

**BURNHAM BEECHES**, a wooded tract of 375ac. in Buckinghamshire, England, acquired in 1879 by the corporation of the City of London, and preserved for public use. This tract, the remnant of an ancient forest, lies west of the road between Slough and Beaconsfield, and 2 miles north of Burnham Beeches station on the Great Western railway. Near the township of Burnham are slight Early English remains of an abbey founded in 1265. The district is developing as a residential centre. Population of civil parish of Burnham (1921) 4,113.

**BURNHAM-ON-CROUCH**, urban district, Essex, England, 43m. E. by N. from London on a branch of the L.N.E. railway. Pop. (1931) 3,395. Burnham lies 6m. from the North sea; below it the Crouch is joined on the south side by the Roch, which branches into numerous creeks, and, together with the main estuary, forms Foulness, Wallasea, Pottton and other low, flat islands, embanked and protected from incursions of the sea. The church of St. Mary is principally late Perpendicular, a good example; it has decorated portions and a Norman font. There are extensive oyster beds in the Crouch estuary.

**BURNING TO DEATH.** As a legal punishment for various crimes burning alive was formerly very widespread. It was common among the Romans, being given in the XII. Tables as the special penalty for arson. Under the Gothic codes adulterers were so punished, and throughout the middle ages it was the civil penalty for certain heinous crimes. In England, under the common law, women condemned for high treason or petty treason (murder of husband, murder of master or mistress, certain offences against the coin, etc.) were burned, this being considered more "decent" than hanging and exposure on a gibbet. In practice the convict was strangled before being burnt. The last woman burnt in England suffered in 1789, the punishment being abolished in 1790.

Burning was not included among the penalties for heresy under the Roman imperial codes; but the burning of heretics by orthodox mobs had long been sanctioned by custom before the edicts of emperor Frederick II. (1222-23) made it the civil-law punishment for heresy. His example was followed in France by Louis IX. in the Establishments of 1270. In England, where the civil law was never recognized, the common law took no cognizance of ecclesiastical offences, and the church courts had no power to condemn to death. There were, indeed, in the 12th and 13th centuries isolated instances of the burning of heretics. William of Newburgh describes the burning of certain foreign sectaries in 1169, and early in the 13th century a deacon was burnt by order of the council of Oxford (Foxe ii. 374; cf. Bracton, *de Corona*, ii. 300), but by what legal sanction is not obvious. The right of the Crown to issue writs *de haeretico comburendo*, claimed for it by later jurists, was based on that issued by Henry IV. in 1400 for the burning of William Sawtre; but Sir James Stephen (*Hist. Crim. Law*) points out that this was issued "with the assent of the lords temporal," which seems to prove that the Crown had no right under the common law to issue such writs. The burning of heretics was actually made legal in England by the statute *de haeretico comburendo* (1400), passed ten days after the issue of the above writ. This was repealed in 1533, but the Six Articles Act of 1539 revived burning as a penalty for denying transubstantiation. Under Queen Mary the acts of Henry IV. and Henry V. were revived; they were finally abolished in 1558 on the accession of Elizabeth. Edward VI., Elizabeth and James I., however, burned heretics (illegally as it would appear) under their supposed right of issuing writs for this purpose. The last heretics burnt in England were two Arians, Bartholomew Legate at Smithfield and Edward Wightman at Lichfield, both in 1610. As for witches, countless numbers were burned in most European countries, though not in England, where they were hanged. In Scotland in Charles II.'s day the law still was that witches were to be "worried at the stake and then burnt"; and a witch was burnt at Dornoch so late as 1708.

**BURNISHER**, a tool used principally in the arts, as the name implies, to give a high polish to a decorated surface. The tool differs in size, shape and material, according to the purpose for which it is intended. The burnisher used by the artist is generally about 10 to 12 in. in length. At one end is an agate, flint or blood stone, very smoothly polished, and cut in various shapes, ranging from a point to a round, square or oblong end, curved hook or spear shape, firmly set in a metal ferrule. The burnisher,

TYPES OF FLINT AND AGATE BURNISHERS USED IN BOOKBINDING

as a finishing tool, is brought into the process of gilding after the surface has been carefully prepared—scraped, cleaned, polished, washed in an acid solution and thoroughly dried. The gold leaf is then applied and the colour brought out by means of rubbing with the burnisher.

We find on very early panel and mural paintings, and on illuminated manuscripts, a thinly beaten gold-leaf or finely powdered metallic gold, applied over a smooth priming or foundation, similar to what we to-day call burnish gold size. This was prepared by the early gilders from a very high grade of rabbit or hide

glue, mixed together with natural red bolus, a variety of clay. After the gold size has dried smooth and hard, the gold-leaf or powder is carefully applied and then very gently rubbed with the burnisher until the desired high finish is obtained. It is necessary, that the gold to be burnished be laid on a very smooth and hard surface to obtain the most brilliant results. To-day, burnish gold-leaf, a variety differing only slightly from the ordinary gold-leaf—about one karat softer—is used extensively. Genuine metallic gold powder is but seldom employed owing to its high cost. As substitute, the imitation gold powder, or so-called burnishing bronze, is widely used commercially. The gilders of picture and mirror frames, book edges, greeting and playing card edges, illuminated manuscripts and other productions are the principal users of these burnishers.

Another style of burnisher made of a very high grade steel is used by the artist etcher and metal worker to remove rough burrs or to obtain a highly polished surface to parts of the copper or zinc plate, or to make corrections. The carver of leather also employs a burnisher to give a desired finish to the tooled leather. The burnisher used by the ceramic artist to finish gold decorations on china or porcelain, is made of spun glass. The gold on the china is quite dull after leaving the firing kiln. It is carefully burnished with the glass burnisher until the finish which is required is obtained.

There is no record of any definite date or period when burnishers were introduced in the arts. From earliest times there is evidence of their use. (See also POTTERIES AND PORCELAINS; CHINAWARE; GILDING.) (F. W. WE.)

**BURNLEY**, municipal, county and parliamentary borough of Lancashire, England, at the junction of the rivers Brun and Calder, 29m. N. of Manchester, on the L.M.S. railway and the Leeds and Liverpool canal. Pop. (1891) 87,016; (1931) 98,259. The church of St. Peter has a Perpendicular tower, but is largely modernized. During the cotton famine consequent upon the American Civil War of 1861–65 Burnley suffered severely, and the operatives were employed on relief works embracing an extensive system of improvements. In 1902 Towneley Hall and Park were acquired by the corporation, the mansion being adapted to use as a museum and art gallery. There are a school of science, municipal technical school, and public parks and recreation grounds. The principal industries are cotton-weaving, worsted-making, iron-founding, coal-mining, brick-burning and the making of sanitary wares. The parliamentary borough (1867) returns one member. The town was incorporated in 1861 and the county borough was created in 1888. The corporation consists of a mayor, 12 aldermen and 36 councillors. By act of parliament in 1890 Burnley was created a suffragan bishopric of the diocese of Manchester. Area of county borough, 4,686 acres.

**BURNOUF, EUGENE** (1801–1852), French orientalist, was born in Paris on April 8 1801, and died May 28 1852. He published in 1826 an *Essai sur le Pâli* . . ., written in collaboration with Christian Lassen; and in the following year *Observations grammaticales sur quelques passages de l'essai sur le Pâli*. His next great work was the deciphering of the Zend manuscripts brought to France by Anquetil Duperron (q.v.). By his labours a knowledge of the Zend language was first brought into the scientific world of Europe. He caused the *Vendidad Sade*, part of one of the books bearing the name of Zoroaster, to be lithographed with the utmost care from the Zend ms. in the Bibliothèque Nationale, and published it in folio parts, 1829–43. From 1833 to 1835 he published his *Commentaire sur le Yaçna, l'un des livres liturgiques des Parses*; he also published the Sanskrit text and French translation of the *Bhâgavata Purâna ou histoire poétique de Krichna* in three folio volumes (1840–47). His last works were *Introduction à l'histoire du Bouddhisme indien* (1844), and a translation of *Le lotus de la bonne loi* (1852).

**BIBLIOGRAPHY.**—See a notice of Burnouf's works by Barthélemy Saint-Hilaire, prefixed to the second edition (1876) of the *Intro. à l'histoire du Bouddhisme indien*; also Naudet, "Notice historique sur MM. Burnouf, père et fils," in *Mém. de l'Acad. des Inscriptions*, xx. A list of his valuable contributions to the *Journal asiatique*, and of his ms. writings, is given in the appendix to the *Choix de lettres d'Eugène Burnouf* (1891).

**BURNOUS**, a long cloak of coarse woollen stuff with a hood, usually white in colour, worn by the Arabs and Berbers throughout North Africa.

**BURNS, SIR GEORGE, BART.** (1795–1890), British ship-owner, was born in Glasgow on Dec. 10, 1795, the son of the Rev. John Burns. In partnership with a brother, James, he began as a Glasgow general merchant about 1818, and in 1824, in conjunction with a Liverpool partner, Hugh Matthie, started a line of small sailing ships which ran between Glasgow and Liverpool. As business increased the vessels were also sailed to Belfast, and steamers afterwards replaced the sailing ships. In 1830 a partnership was entered into with the McIvers of Liverpool, in which George Burns devoted himself specially to the management of the ships. In 1838 with Samuel Cunard, Robert Napier and other capitalists, the partners (McIver and Burns) started the "Cunard" Atlantic line of steamships. They secured the British Government's contract for the carrying of the mails of North America. The sailings were begun with four steamers of about 1,000 tons each, which made the passage in 15 days at some 8½ knots per hour. George Burns retired from the Glasgow management of the line in 1860. He was made a baronet in 1889. He died on June 2, 1890 at Castle Wemyss.

SIR JOHN BURNS (1829–1901), his eldest son, became head of the Cunard Company, and was created a peer, under the title of Baron Inverclyde, in 1897; he was the first to suggest to the Government the use of merchant vessels for war purposes.

GEORGE ARBUTHNOT BURNS (1861–1905), 2nd Baron Inverclyde, became chairman of the Cunard Company in 1902. He conducted the negotiations which resulted in the refusal of the Cunard Company to enter the shipping combination, the International Mercantile Marine Company, formed by Messrs. J. P. Morgan & Co., and took a leading part in the application of turbine engines to ocean liners.

**BURNS, JOHN** (1858– ), English politician, was born at Vauxhall, London, in October 1858, the second son of Alexander Burns, an engineer, of Ayrshire extraction. He attended a national school in Battersea until he was ten years old, when he was sent to work in Price's candle factory. He worked for a short time as a page-boy, then in some engine works, and at fourteen was apprenticed for seven years to a Millbank engineer. He continued his education at the night-schools, and read extensively, especially the works of Robert Owen, J. S. Mill, Paine and Cobbett. He ascribed his conversion to the principles of Socialism to his sense of the insufficiency of the arguments advanced against it by J. S. Mill, but he had learnt Socialistic doctrine from a French fellow-workman, Victor Delahaye, who had witnessed the Commune. After working at his trade in various parts of England, and on board ship, he went for a year to the West African coast at the mouth of the Niger as a foreman engineer. His earnings from this undertaking were expended on a six months' tour in France, Germany and Austria for the study of political and economic conditions. He had early begun the practice of outdoor speaking, and his exceptional physical strength and strong voice were invaluable qualifications for a popular agitator. In 1878 he was arrested and locked up for the night for addressing an open-air demonstration on Clapham Common. He was again arrested in 1886 for his share in the West End riots when the windows of the Carlton and other London clubs were broken, but cleared himself at the Old Bailey of the charge of inciting the mob to violence. In November of the next year, however, he was again arrested for resisting the police in their attempt to break up the meeting in Trafalgar Square, and was condemned to six weeks' imprisonment. In 1884 he joined the Social Democratic Federation, which put him forward unsuccessfully in the next year as parliamentary candidate for West Nottingham. His connection with the Social Democratic Federation was short-lived; but he was an active member of the executive of the Amalgamated Society of Engineers, and was still working at his trade in Hoe's printing machine works when he became a Progressive member of the first London County Council, being supported by an allowance of £2 a week subscribed by his constituents, the Battersea working men. He introduced in 1892 a

motion that all contracts for the County Council should be paid at trade union rates and carried out under trade union conditions, and devoted his efforts in general to a war against monopolies, except those of the state or the municipality. In the same year (1889) in which he became a member of the County Council he acted with Ben Tillett as the chief leader and organizer of the London dock strike. He entered the House of Commons as member for Battersea in 1892, and was re-elected in 1895, 1900 and 1906. In parliament he became well known as an Independent Radical, and he was included in the Liberal cabinet by Sir Henry Campbell-Bannerman in December 1905 as president of the Local Government Board, and retained the office in Mr. Asquith's government. His policy at the Local Government Board was thought to be too conservative even by some members of the Conservative Party, and early in 1914 he was promoted to the presidency of the Board of Trade. He left the Government in the following August, as he disagreed with the Cabinet's decision to join in the World War. He resigned without making any public statement of his reasons, and took no further active part in Parliament. At the general election of 1918 he desired to stand again for Battersea in the Labour interest. As, however, he refused to join the Labour Party he was unable to get local support.

**BURNS, ROBERT** (1759-1796), greatest of Scottish poets, was born on Jan. 25, 1759, in a cottage about 2m. from Ayr. He was the eldest son of a small farmer, William Burness, of Kincardineshire stock. "The poet," said Thomas Carlyle, "was fortunate in his father—a man of thoughtful, intense character, as the best of our peasants are, valuing knowledge, possessing some and open-minded for more, of keen insight and devout heart, friendly and fearless: a fully unfolded man seldom found in any rank in society, and worth descending far in society to seek. . . . Had he been ever so little richer, the whole might have issued otherwise. But poverty sank the whole family even below the reach of our cheap school system, and Burns remained a hard-worked plough-boy."

Through a series of migrations from one unfortunate farm to another; from Alloway (where he was taught to read) to Mt. Oliphant, and then (1777) to Lochlea in Tarbolton (where he learnt the rudiments of geometry), the poet remained in the same condition of straitened circumstances. At the age of 13 he thrashed the corn with his own hands, at 15 he was the principal labourer. "This kind of life," he writes, "the cheerless gloom of a hermit and the unceasing toil of a galley-slave, brought me to my 16th year." His naturally robust frame was overtaken, and his nervous constitution received a fatal strain. His shoulders were bowed, he became liable to headaches, palpitations and fits

BIRTHPLACE OF BURNS AT ALLOWAY, 2¼ M. SOUTH OF AYR; SCENE OF THE "COTTER'S SATURDAY NIGHT"

of depressing melancholy. From these hard tasks and his fiery temperament, craving in vain for sympathy in a frigid air, grew a thirst for stimulants and revolt against restraint. Sent to school at Kirkoswald, he became, for his scant leisure, a great reader—eating at meal-times with a spoon in one hand and a book in the other—carrying a few small volumes in his pocket to study in spare moments in the fields. "The collection of songs," he tells us, "was my *vade mecum*. I pored over them driving my cart or

walking to labour, song by song, verse by verse, carefully noting the true, tender, sublime or fustian." He lingered over the ballads in his cold room by night; by day, whilst whistling at the plough, he invented new forms and was inspired by fresh ideas, "gathering around him the memories and the traditions of his country till they became a mantle and a crown."

Burns had written his first verses of note, "Behind yon hills where Stinchar (afterwards Lugar) flows," when in 1782 he went to Irvine to learn the trade of a flax-dresser. "It was," he says, "an unlucky affair. As we were giving a welcome carousal to the New Year, the shop took fire and burned to ashes; and I was left, like a true poet, without a sixpence." His own heart, too, had unfortunately taken fire. He was poring over mathematics till, in his own phraseology—still affected in its prose by the classical pedantries caught from Pope by Ramsay—"the sun entered Virgo, when a charming *fillette*, who lived next door, overset my trigonometry, and set me off at a tangent from the scene of my studies." The poet was jilted, went through the usual despairs, and resorted to the not unusual sources of consolation. He had found that he was "no enemy to social life," and his mates had discovered that he was the best of boon companions in the lyric feasts, where his eloquence shed a lustre over wild ways of life, and where he was beginning to be distinguished as a champion of the New Lights and a satirist of the Calvinism whose waters he found like those of Marah.

In Robert's 25th year his father died, full of sorrows and apprehensions for the gifted son who wrote for his tomb in Alloway kirkyard, the fine epitaph ending with the characteristic line—

For even his failings leaned to virtue's side.

For some time longer the poet, with his brother Gilbert, lingered at Lochlea, reading agricultural books, miscalculating crops, attending markets, and in a mood of reformation resolving, "in spite of the world, the flesh and the devil, to be a wise man." Affairs, however, went no better with the family; and in 1784 they migrated to Mossgiel, where he lived and wrought, during four years, for a return scarce equal to the wage of the commonest labourer in our day. Meanwhile he had become intimate with his future wife, Jean Armour; but the father, a master mason, discountenanced the match, and the girl being disposed to "sigh as a lover," as a daughter to obey, Burns, in 1786, gave up his suit, resolved to seek refuge in exile, and having accepted a situation as book-keeper to a slave estate in Jamaica, had taken his passage in a ship for the West Indies. His old associations seemed to be breaking up, men and fortune scowled, and "hungry ruin had him in the wind," when he wrote the lines ending—

Adieu, my native banks of Ayr,

and addressed to the most famous of the loves, in which he was as prolific as Catullus or Tibullus, the proposal—

Will ye go to the Indies, my Mary.

He was withheld from his project and the current of his life was turned by the success of his first volume, which was published at Kilmarnock in June, 1786. It contained some of his most justly celebrated poems, the results of his scanty leisure at Lochlea and Mossgiel; among others "The Twa Dogs"—a graphic idealization of Aesop—"The Author's Prayer," "The Address to the Deil," "The Vision," "The Dream," "Hallowe'en," "The Cotter's Saturday Night," the lines "To a Mouse" and "To a Daisy," "Scotch Drink," "Man was made to Mourn," the "Epistle to Davie," and some of his most popular songs. This epitome of a genius so marvellous and so varied took his audience by storm. "The country murmured of him from sea to sea." "With his poems," says Robert Heron, "old and young, grave and gay, learned and ignorant, were alike transported. I was at that time resident in Galloway, and I can well remember how even plough-boys and maid-servants would have gladly bestowed the wages they earned the most hardly, and which they wanted to purchase necessary clothing, if they might but procure the works of Burns." This first edition only brought the author £20 direct return, but it introduced him to the *literati* of Edinburgh, whither

he was invited, and where he was welcomed, feasted, admired and patronized.

Sir Walter Scott bears testimony to the dignified simplicity, and almost exaggerated independence of the poet, during this *annus mirabilis* of his success. "As for Burns, *Virgilium vidi tantum*, I was a lad of 15 when he came to Edinburgh, but had sense enough to be interested in his poetry, and would have given the world to know him. I saw him one day with several gentlemen of literary reputation, among whom I remember the celebrated Dugald Stewart. Of course we youngsters sat silent, looked and listened . . . I remember . . . his shedding tears over a print representing a soldier lying dead in the snow, his dog sitting in misery on one side, on the other his widow with a child in her arms. His person was robust, his manners rustic, not clownish. . . . His countenance was more massive than it looks in any of the portraits. There was a strong expression of shrewdness in his lineaments; the eye alone indicated the poetic character and temperament. It was large and of a dark cast, and literally glowed when he spoke with feeling or interest. I never saw such another eye in a human head. His conversation expressed perfect self-confidence, without the least intrusive forwardness. . . . He was much caressed in Edinburgh, but the efforts made for his relief were extremely trifling." Burns went from those meetings, where he had been posing professors (no hard task), and turning the heads of duchesses, to share a bed in the garret of a writer's apprentice—they paid together 3s. a week for the room. It was in the house of Mr. Carfrae, Baxter's Close, Lawnmarket, "first scale stair on the left hand in going down, first door in the stair." During Burns's life it was reserved for William Pitt to recognize his place as a great poet; the more cautious critics of the north were satisfied to endorse him as a rustic prodigy, and brought upon themselves a share of his satire. Some of the friendships contracted during this period—as for Lord Glencairn and Mrs. Dunlop—are among the most pleasing and permanent in literature. But in the poet's city life there was an unnatural element. He stooped to beg for neither smiles nor favour, but the gnarled country oak is cut up into cabinets in artificial prose and verse. In the letters to Graham, the prologue to Wood, and the epistles to Clarinda, he is dancing minuets with hob-nailed shoes. When, in 1787, the second edition of the *Poems* came out, the proceeds of their sale realized for the author £400. On the strength of this sum he gave himself two long rambles, full of poetic material—one through border towns into England as far as Newcastle, returning by Dumfries to Mauchline, and another a grand tour through the East Highlands, as far as Inverness, returning by Edinburgh, and so home to Ayrshire.

In 1788 Burns took a new farm at Ellisland<sup>1</sup> on the Nith, settled there, married, lost his little money, and wrote, among other pieces, "Auld Lang Syne" and "Tam o' Shanter." In 1789 he obtained, through the good office of Mr. Graham, of Fintry, an appointment as excise-officer of the district, worth £50 per annum. In 1791 he removed to a similar post at Dumfries worth £70. In the course of the following year he was asked to contribute to George Thomson's *Select Collection of Original Scottish Airs with Symphonies and Accompaniments for the Piano-forte and Violin: the poetry by Robert Burns*. To this work he contributed about 100 songs, the best of which are now ringing in the ear of every Scotsman from New Zealand to San Francisco. For these, original and adapted, he received a shawl for his wife, a picture by David Allan representing the "Cotter's Saturday Night" and £5. The poet wrote an indignant letter and never afterwards composed for money. Unfortunately the "Rock of Independence" to which he proudly retired was but a castle of air, over which the meteors of French political enthusiasm cast a lurid gleam. In the last years of his life, exiled from polite society on account of his revolutionary opinions, he became sourer in temper and plunged more deeply into the dissipations of the lower ranks, among whom he found his only companionship and sole, though shallow, sympathy.

<sup>1</sup>In 1928 Ellisland was bequeathed to the British nation by John Williamson of Edinburgh.

Burns began to feel himself prematurely old. Walking with a friend who proposed to him to join a county ball, he shook his head, saying "that's all over now," and adding a verse of Lady Grizel Baillie's ballad—

O were we young as we ance hae been,  
We sud hae been galloping down on yon green,  
And linking it ower the lily-white lea,  
But were na my heart light I wad dee.

His hand shook; his pulse and appetite failed; his spirits sank into a uniform gloom. In April 1796 he wrote—"I fear it will be some time before I tune my lyre again. By Babel's streams I have sat and wept. I have only known existence by the pressure of sickness and counted time by the repercussions of pain. I close my eyes in misery and open them without hope. I look on the vernal day and say with poor Fergusson—

Say wherefore has an all-indulgent heaven,  
Life to the comfortless and wretched given."

On July 4 he was seen to be dying. On the 12th he wrote to his cousin for the loan of £10 to save him from passing his last days in jail. On the 21st he was no more. On the 25th, when his last son came into the world, he was buried with local honours, the volunteers of the company to which he belonged firing three volleys over his grave.

Burns's lyrics owe part of their popularity to the fact of their being an epitome of melodies, moods and memories that had belonged for centuries to the national life, the best inspirations of which have passed into them. But in gathering from his ancestors Burns has exalted their work by asserting a new dignity for their simplest themes. He is the pupil of Ramsay, but he leaves his master to make a social protest and to lead a literary revolt. The *Gentle Shepherd*, still largely a court pastoral, in which "a man's a man" if born a gentleman, may be contrasted with "The Jolly Beggars"—the one is like a minuet of the ladies of Versailles on the sward of the Swiss village near the Trianon, the other like the march of the maenads with Théroigne Méricourt. Ramsay adds to the rough tunes and words of the ballads the refinement of the wits who in the "Easy" and "Johnstone" clubs talked over their cups of Prior and Pope, Addison and Gay. Burns inspires them with a fervour that thrills the most wooden of his race. We may clench the contrast by a representative example. This is from Ramsay's version of perhaps the best-known of Scottish songs:—

Methinks around us on each bough  
A thousand Cupids play;  
Whilst through the groves I walk with you,  
Each object makes me gay.  
Since your return—the sun and moon  
With brighter beams do shine,  
Streams murmur soft notes while they run  
As they did lang syne.

Compare the verses in Burns—

We twa hae run about the braes  
And pu'd the gowans fine;  
But we've wandered mony a weary foot  
Sin auld lang syne.  
We twa hae paidl'd in the burn,  
Frae morning sun till dine:  
But seas between us braid hae roar'd  
Sin auld lang syne.

The affectations of Burns's style are insignificant and rare. His prevailing characteristic is an absolute sincerity. A love for the lower forms of social life was his besetting sin; Nature was his healing power. He compares himself to an Aeolian harp, strung to every wind of heaven. His genius flows over all living and lifeless things with a sympathy that finds nothing mean or insignificant. An uprooted daisy becomes in his pages an enduring emblem of the fate of artless maid and simple bard. He disturbs a mouse's nest and finds in the "tim'rous beastie" a fellow-mortal doomed like himself to "thole the winter's sleety dribble," and draws his oft-repeated moral. He walks abroad and, in a verse that glints with the light of its own rising sun before the fierce sarcasm of "The Holy Fair," describes the melodies of a "simmer

Sunday morn." He loiters by Afton Water and "murmurs by the running brook a music sweeter than its own." He stands by a roofless tower, where "the howlet mourns in her dewy bower," and "sets the wild echoes flying," and adds to a perfect picture of the scene his famous vision of "Libertie." In a single stanza he concentrates the sentiment of many night thoughts—

The wan moon is setting beyond the white wave,  
And Time is setting wi' me, O.

For other examples of the same graphic power we may refer to the course of his stream—

Whiles ow'r a linn the burnie plays  
As through the glen it wimpled,

or to "The Birks of Aberfeldy" or the "spate" in the dialogue of "The Brigs of Ayr." The poet is as much at home in the presence of this flood as by his "trottin' burn's meander." Familiar with all the seasons he represents the phases of a northern winter with a frequency characteristic of his clime and of his fortunes; her tempests become anthems in his verse, and the sounding woods "raise his thoughts to Him that walketh on the wings of the wind"; full of pity for the shelterless poor, the "ourie cattle," the "silly sheep," and the "helpless birds," he yet reflects that the bitter blast is not "so unkind as man's ingratitude." This constant tendency to ascend above the fair or wild features of outward things, or to penetrate beneath them, to make them symbols, to endow them with a voice to speak for humanity, distinguishes Burns as a descriptive poet from the rest of his countrymen.

Lovers of rustic festivity may hold that the poet's greatest performance is his narrative of "Hallowe'en," which for easy vigour, fullness of rollicking life, blended truth and fancy, is unsurpassed in its kind. Campbell, Wilson, Hazlitt, Montgomery, Burns himself, and the majority of his critics, have recorded their preference for "Tam o' Shanter," where the superstitious element that has played so great a part in the imaginative work of this part of Britain is brought more prominently forward. Few passages of description are finer than that of the roaring Doon and Alloway Kirk glimmering through the groaning trees; but the unique excellence of the piece consists in its variety, and a perfectly original combination of the terrible and the ludicrous. Like Goethe's *Walpurgis Nacht*, brought into closer contact with real life, it stretches from the drunken humours of Christopher Sly to a world of fantasies almost as brilliant as those of the *Midsummer Night's Dream*, half solemnized by the severer atmosphere of a sterner clime. The contrast between the lines "Kings may be blest," and those which follow, beginning "But pleasures are like poppies spread," is typical of the perpetual antithesis of the author's thought and life, in which, at the back of every revelry, he sees the shadow of a warning hand, and reads on the wall the writing, *Omnia mutantur*. With equal or greater confidence other judges have pronounced Burns's masterpiece to be "The Jolly Beggars." Certainly no other single production so illustrates his power of exalting what is insignificant, glorifying what is mean, and elevating the lowest details by the force of his genius. "The form of the piece," says Carlyle, "is a mere cantata, the theme the half-drunken snatches of a joyous band of vagabonds, while the grey leaves are floating on the gusts of the wind in the autumn of the year. But the whole is compacted, refined and poured forth in one flood of liquid harmony. It is light, airy and soft of movement, yet sharp and precise in its details; every face is a portrait, and the whole a group in clear photography. The blanket of the night is drawn aside; in full ruddy gleaming light these rough tatterdemalions are seen at their boisterous revel wringing from Fate another hour of wassail and good cheer." Over the whole is flung a half-humorous, half-savage satire—aimed, like a two-edged sword, at the laws, and the law-breakers, in the acme of which the graceless crew are raised above the level of ordinary gipsies, footpads and rogues, and are made to sit "on the hills like gods together, careless of mankind," and to launch their Titan thunders of rebellion against the world.

A fig for those by law protected;  
Liberty's a glorious feast;  
Courts for cowards were erected,  
Churches built to please the priest.

The most scathing of his *Satires*, under which head fall many of his minor and frequent passages in his major pieces, are directed against the false pride of birth, and what he conceived to be the false pretences of religion. The apologue of "Death and Dr. Hornbook," "The Ordination," the song, "No churchman am I for to rail and to write," the "Address to the Unco Guid," "Holy Willie," and above all "The Holy Fair," with its savage caricature of an ignorant ranter of the time called Moodie, and others of like stamp, not unnaturally provoked offence. Burns had a firm faith in a Supreme Being, not as a vague mysterious Power, but as the Arbiter of human life. Amid the vicissitudes of his career he responds to the cotter's summons, "Let us worship God."

An atheist's laugh's a poor exchange  
For Deity offended

is the moral of all his verse, which treats seriously of religious matters. His prayers in rhyme give him a high place among secular psalmists.

Like Chaucer, Burns was a great moralist, though a rough one. In the "Epistle to a Young Friend," the shrewdest advice is blended with exhortations appealing to the highest motive, that which transcends the calculation of consequences, and bids us walk in the straight path from the feeling of personal honour, and "for the glorious privilege of being independent." Burns, like Dante, "loved well because he hated, hated wickedness that hinders loving," and this feeling, as in the lines—"Dweller in yon dungeon dark," sometimes breaks bounds; but his calmer moods are better represented by the well-known passages in the "Epistle to Davie," in which he preaches acquiescence in our lot, and a cheerful acceptance of our duties in the sphere where we are placed. This *philosophie douce*, never better sung by Horace, is the prevailing refrain of our author's *Songs*. These have passed into the air we breathe; they are so real that they seem things rather than words, or, nearer still, living beings. They have taken all hearts, because they are the breath of his own; not polished cadences, but utterances as direct as laughter or tears. Between the first of war songs, composed in a storm on a moor, and the pathos of "Mary in Heaven," he has made every chord in our northern life to vibrate. The distance from "Duncan Gray" to "Auld Lang Syne" is nearly as great as that from Falstaff to Ariel. There is the vehemence of battle, the wail of woe, the march of veterans "red-wat-shod," the smiles of meeting, the tears of parting friends, the gurgle of brown burns, the roar of the wind through pines, the rustle of barley rigs, the thunder on the hill—all Scotland in his verse. Let who will make her laws, Burns has made the songs, which her emigrants recall "by the long wash of Australasian seas," in which maidens are wooed, by which mothers lull their infants, which return "through open casements unto dying ears"—they are the links, the watch-words, the masonic symbols of the Scots race. (J. N.)

The greater part of Burns's verse was posthumously published, and, as he himself took no care to collect the scattered pieces of occasional verse, different editors have from time to time printed, as his, verses that must be regarded as spurious. *Poems chiefly in the Scottish dialect*, by Robert Burns (Kilmarnock, 1786), was followed by an enlarged edition printed in Edinburgh in the next year. Other editions of this book were printed—in London (1787), an enlarged edition at Edinburgh (1793) and a reprint of this in 1794. A facsimile of the 1786 edition was published in 1927. Poems by Burns appeared originally in the *Caledonian Mercury*, the *Edinburgh Evening Courant*, the *Edinburgh Herald*, the *Edinburgh Advertiser*; the London papers, *Stuart's Star* and *Evening Advertiser* (subsequently known as the *Morning Star*), the *Morning Chronicle*; and in the *Edinburgh Magazine* and the *Scots Magazine*. Many poems, most of which had first appeared elsewhere, were printed in a series of penny chap-books, *Poetry Original and Select* (Brash and Reid, Glasgow), and some appeared separately as broadsides. A series of tracts issued by Stewart and Meikle (1796-99) includes some of Burns's numbers; *The Jolly Beggars*, *Holy Willie's Prayer* and other poems making their first appearance in this way. The seven numbers of this publication were reissued in Jan. 1800 as *The Poetical Miscellany*. This was followed by Thomas Stewart's *Poems ascribed to Robert Burns* (Glasgow,

1801). Burns's songs appeared chiefly in James Johnson's *Scots Musical Museum* (1787-1803), which he appears after the first volume to have virtually edited, though the two last volumes were published only after his death; and in George Thomson's *Select Collection of Original Scottish Airs* (1793-1841). Only five of the songs done for Thomson appeared during the poet's lifetime, and Thomson's text cannot be regarded with confidence. The Hastie mss. in the British Museum (Addit. ms. 22,307) include 162 songs, many of them in Burns's handwriting; and the Dalhousie mss., at Brechin Castle, contains Burns's correspondence with Thomson. For a full account of the songs see James C. Dick, *The Songs of Robert Burns now first printed with the Melodies for which they were written* (1903); also D. Cook, *Annotations of Scottish Songs by Burns* (1922).

The items in W. Craibe Angus's *Printed Works of Robert Burns* (1899) number 930. Only the more important collected editions can be here noticed. Dr. Currie was the anonymous editor of the *Works of Robert Burns; with an Account of his Life, and a Criticism on his Writings* . . . (Liverpool, 1800). This was undertaken for the benefit of Burns's family at the desire of his friends, Alexander Cunningham and John Syme. A second and amended edition appeared in 1801, and was followed by others, but Currie's text is neither accurate nor complete. Additional matter appeared in *Reliques of Robert Burns* . . . by R. H. Cromek (London, 1808). In *The Works of Robert Burns, With his Life*, by Allan Cunningham (London, 1834) there are many additions and much biographical material. *The Works of Robert Burns*, edited by James Hogg and William Motherwell (1838-41), contains a life of the poet by Hogg, and some useful notes by Motherwell, attempting to trace the sources of Burns's songs. The *Correspondence between Burns and Clarinda* was edited by W. C. McLehose (1843). An improved text of the poems was provided in the second "Aldine Edition" of the *Poetical Works* (1839), for which Sir H. Nicolas, the editor, made use of many original mss. In *The Life and Works of Robert Burns*, ed. by Robert Chambers (1851-52; library edition, 1856-57; new edition, revised by William Wallace, 1896), the poet's works are given in chronological order, interwoven with letters and biography. Other well-known editions are those of George Gilfillan (1856); of Alexander Smith (Golden Treasury Series 1865); of P. Hatley Waddell (Glasgow, 1867); an edition with Dr. Currie's memoir and an essay by Prof. Wilson (1843-44); of W. Scott Douglas (the Kilmarnock edition, 1876, and the "library" edition, 1877-79), and of Andrew Lang, assisted by W. A. Craigie (1896). The complete correspondence between Burns and Mrs. Dunlop was printed by W. Wallace (1898).

A critical edition of the *Poetry of Robert Burns*, which may be regarded as definitive, and is provided with full notes and variant readings, was prepared by W. E. Henley and T. F. Henderson (1896-97; reprinted 1901), and is generally known as the "Centenary Burns." In vol. iii. the extent of Burns's indebtedness to Scottish folk-song and his methods of adaptation are minutely discussed; vol. iv. contains an essay on "Robert Burns. Life, Genius, Achievement," by W. E. Henley.

The chief original authority for Burns's life is his own letters. The principal "lives" are to be found in the editions just mentioned. His biography has also been written by J. Gibson Lockhart (*Life of Burns*, 1828); for the "English Men of Letters" series in 1879 by Prof. J. Campbell Shairp; and by Sir Leslie Stephen in the *Dictionary of National Biography* (vol. viii., 1886). For the more important essays on Burns see Thomas Carlyle (*Edinburgh Review*, Dec. 1828); John Nichol (W. Scott Douglas's edition of Burns); R. L. Stevenson (*Familiar Studies of Men and Books*); Auguste Angellier (*Robert Burns: La vie et les oeuvres* 1893); Lord Rosebery (*Robert Burns: Two Addresses in Edinburgh*, 1896); J. Logie Robertson (in *In Scottish Fields*, 1890, and *Furth in Field*, 1894); T. F. Henderson, *Robert Burns* (1904); A. Dakers, *Robert Burns. His Life and Genius* (1923). There is a selected bibliography in chronological order in W. A. Craigie's *Primer of Burns* (1896).

**BURNS AND SCALDS.** A burn is the effect of dry heat of 140° F and over, a scald being the result of moist heat of over 120° F. Clinically there is no distinction between the two, and their classification and treatment are identical. In Dupuytren's classification, burns are divided into six classes according to the severest part of the lesion. Burns of the first degree are characterized by severe pain, redness, transient swelling, and later exfoliation of the skin. Burns of the second degree show vesicles (small blisters) over the inflamed area. Beneath the vesicle the highly sensitive papillae of the skin are exposed. They leave no scar, but often produce a permanent discoloration. In burns of the third degree, there is a partial destruction of the true skin, leaving sloughs of a yellowish or black colour. The pain is at first intense, but passes off on about the second day to return again at the end of a week, when the sloughs separate, exposing the sensitive nerve filaments of the underlying skin. This results in a slightly depressed cicatrix which shows but slight tendency to contraction. Burns of the fourth degree, which follow the pro-

longed application of any form of intense heat, involve the total destruction of the true skin. The pain is much less severe than in the preceding class, since the nerve endings have been totally destroyed. The results, however, are far more serious, and healing is slow. Deep puckered scars are formed, which show great tendency to contract, and the resulting loss of function may be extremely serious. In burns of the fifth degree the underlying muscles are more or less destroyed, and in those of the sixth the bones are also charred.

The clinical history of a severe burn can be divided into three periods. The first lasts from 36 to 48 hours, during which the patient lies in a condition of profound shock and feels little or no pain. If death results coma first supervenes. The second period begins when the effects of shock pass, and continues until the slough separates, which takes one to two weeks. Much fever is present, and the tendency to complications is great. Bronchitis, pneumonia, pleurisy, meningitis, intestinal catarrh, and ulceration of the duodenum, have been recorded. These complications are the result of septic infection and absorption, and antiseptic treatment reduces their frequency. The third period lasts until recovery. The prognosis depends chiefly on the extent of skin involved, death almost invariably resulting when one-third of the total area of the body is affected, however superficially. Of secondary but still grave importance is the position of the burn, one over a serious cavity being more serious than one on a limb. Also it must be remembered that children very easily succumb to shock.

**Treatment.**—The treatment is both general and local. The general treatment in severe burns consists in dealing promptly with shock before attempting to treat the burn itself. Stimulants should be avoided, and every effort made to soothe the patient, a useful aid being immersion in a hot bath. After the stage of shock has passed, the secondary effects, such as toxæmia and septicæmia, must be dealt with on general medical principles. The local treatment should aim at preventing sepsis, avoiding frequent dressings, favouring the removal of the eschar, and of obtaining a pliant scar and avoiding deformity.

Scars from burns may be reduced to some extent by radium and X-rays, provided the treatment is commenced within a few months of the injury.

**BURNSIDE, AMBROSE EVERETT** (1824-1881), American soldier, was born at Liberty, Ind., on May 23, 1824, of Scottish pedigree, his American ancestors settling in the north-west wilderness, where his parents lived in a rude log cabin. He was appointed to the U.S. military academy through casual favour, and graduated in 1847, when war with Mexico was nearly over. In 1853 he resigned his commission, and in 1853-58 was engaged in the manufacture of firearms at Bristol, R.I. In 1856 he invented a breech-loading rifle. When the Civil War broke out he took command of a Rhode Island regiment of three months' militia, on the summons of Governor Sprague, took part in the relief of the national capital and commanded a brigade in the first battle of Bull Run. On Aug. 6, 1861 he was commissioned brigadier-general of volunteers, and placed in charge of the expeditionary force which sailed in Jan. 1862, for the North Carolina coast. The victories of Roanoke Island, Newbern and Fort Macon (Feb.-April) were the chief incidents of the campaign. He was promoted major-general U.S.V. soon afterwards and was transferred to the Virginian theatre of war. Part of his forces fought in the last battles of Pope's campaign in Virginia, and Burnside himself was engaged in the battles of South Mountain and Antietam. At the latter he was in command of McClellan's left wing, but the want of vigour in his attack was unfavourably criticized. His patriotic spirit, modesty and amiable manners, made him highly popular, and upon McClellan's final removal (Nov. 7) from the Army of the Potomac, President Lincoln chose him as successor. The choice was unfortunate. He sustained a crushing defeat at the battle of Fredericksburg (Dec. 13, 1862), and on Jan. 27, 1863, gave way to Gen. Hooker. Transferred to Cincinnati in March, 1863, he caused the arrest and court-martial of Clement L. Vallandigham

(*q.v.*), lately an opposition member of Congress, for an alleged disloyal speech, and later in the year his measures for the suppression of press criticism aroused much opposition; he helped to crush Morgan's Ohio raid in July; then, moving to relieve the loyalists in east Tennessee, in September entered Knoxville, to which the Confederate general James Longstreet unsuccessfully laid siege. In 1864 Burnside led his old corps under Grant in the Wilderness and Petersburg campaigns. After bearing his part well in the many bloody battles of that time, he was overtaken once more by disaster. The failure of the "Burnside mine" at Petersburg brought about his resignation. In 1866 he became governor of Rhode Island, serving for three terms (1866-69). From 1875 till his death he was a Republican member of the U.S. Congress. He was present with the German headquarters at the siege of Paris in 1870-71. He died at Bristol, R.I., on Sept. 13, 1881.

See B. P. Poore, *Life and Public Services of Ambrose E. Burnside* (Providence, 1882); A. Woodbury, *Major-General Burnside and the Ninth Army Corps* (Providence, 1867); Daniel Ross Ballou, *The Military Services of Major-General Ambrose Everett Burnside in the Civil War* (1914).

**BURNSIDE, WILLIAM** (1852-1927), British mathematician, was born in London on July 2, 1852. He was educated at Christ's Hospital and Cambridge. After teaching at Cambridge, Burnside was appointed, in 1885, professor of mathematics at the Royal Naval college, Greenwich, where he remained until he retired in 1919.

Burnside's earlier researches were in applied mathematics, but his later and more important work is in pure mathematics. He is the author of more than 150 papers. In his two papers on automorphic functions (1891-92) Burnside devised a new class of function simpler than that used by Henri Poincaré in his work on the periodicity of functions. This work led him to a study of the theory of groups; he wrote a number of papers on this subject and collected the material into an important book, *Theory of Groups of Finite Order* (1897; second, enlarged edition 1909). He was the author of papers on elliptic functions, non-Euclidean geometry, kinetic theory of gases and theory of waves in liquids. One paper on probability was published in 1918 and a draft of a work on this subject was found amongst his papers after his death, which occurred on Aug. 21, 1927.

Burnside received many academic honours, he was a Fellow of the Royal Society and was awarded the Royal Medal by that society in 1904.

**BURNTISLAND**, a royal, municipal and police burgh, Fife, Scotland, on the shore of the Firth of Forth, 5½ m. S.W. of Kirkcaldy by the L.N.E. railway. Pop. (1931) 5,389. Its links and beach give it repute as a summer resort. The chief industries are distilling, fisheries and shipbuilding. There are railway works and an export of coal and coke. Its harbour is the northern station of a ferry across the firth from Granton, 5 m. south. On the rocks forming the western end of the harbour stands Rossend Castle. The name Burntisland may refer to the time when the site, or part of it, formed an island, as sea-sand is the subsoil even of the oldest quarters. Another derivation is from Gaelic words meaning "the island beyond the bend." It returns one member to parliament with Dysart, Kinghorn, Kirkcaldy, Buckhaven, Methil and Innerleven.

**BURR, AARON** (1756-1836), American political leader, was born at Newark, (N.J.). His father, the Rev. Aaron Burr (1715-57), was the second president of the College of New Jersey, now Princeton university; his mother was the daughter of Jonathan Edwards, the well-known Calvinist theologian. Both parents died when the son was but three years of age and his uncle, Timothy Edwards, became his guardian. Aaron Burr graduated from the College of New Jersey, now Princeton, in 1772 and began studying law in the celebrated law school conducted by his brother-in-law, Tappan Reeve, at Litchfield, (Conn.). When the Revolution broke out the youth joined Washington's army at Cambridge. Impatient with its inaction he enlisted to accompany Arnold on the long and arduous march against Quebec and so distinguished himself that, on Arnold's recommendation, he was attached to Gen. Montgomery's staff. Upon his return he was given a place on Washington's staff, but differences between him

and his general soon resulted in his being transferred to the staff of Gen. Putnam. Burr is given credit for saving, by his vigilance, a whole brigade from capture during the retreat from Long Island, though in doing it he defied the orders of his superiors. As lieutenant-colonel of a regiment, he passed the winter of 1777 at Valley Forge guarding a pass commanding the approach to the camp, and the next June he commanded a brigade and distinguished

FROM JAMES PARTON, "AARON BURR"

HARMON BLENNERHASSETT'S HOME ON THE ISLAND OF THE SAME NAME IN THE OHIO RIVER, WHERE THE AARON BURR CONSPIRACY WAS FORMED

himself at the battle of Monmouth. In Jan. 1779 he assumed command of the American lines stretching from the Hudson to the Sound in Westchester county (N.Y.), a region in which there was much lawlessness and plundering by ill-disciplined troops from both armies. Burr established a thorough patrol system, rigorously enforced martial law and restored order.

Because of ill-health Burr resigned from the army in 1779, renewed the study of law, and in 1782 was admitted to the bar at Albany. That year also witnessed his marriage to Theodosia Prevost, the fascinating and cultured widow of a British officer. The next year, upon the evacuation of New York city by the British, Burr and his wife removed to that city and established themselves in a beautiful mansion at Richmond Hill, just outside the town. The following ten years, when Burr was a leader both in his profession and in the political world and his home the centre of brilliant social gatherings, were doubtless the happiest of his life. He was elected to the State assembly in 1784, and in 1789 his legal talents were recognized by his appointment as attorney-general of the State of New York. In 1791, at the age of 35, he was elected to the U.S. Senate, defeating Gen. Schuyler, father-in-law of Alexander Hamilton, the future leader of the Federalist party. After his service as U.S. Senator he was again for two terms in the State assembly. He had become a power among the Democratic-Republicans of the North, and in 1800 was placed on the presidential ticket with Thomas Jefferson. In New York, recognized as the pivotal State in the election, Burr's personal canvassing and admirable organization were responsible for a Democratic victory. Burr was, in this campaign, the first to organize and manipulate the Tammany society for political purposes, and is credited with starting that institution on its way to political influence. It had been intended that Burr should be vice-president, but through a blunder his name received as many electoral votes as Jefferson's, thus (according to the Constitution at that time) throwing the decision into the House of Representatives. Here a faction of Federalists, preferring Burr to Jefferson, attempted to secure his election and a deadlock for 35 ballots resulted. Hamilton's determined opposition to Burr finally resulted in Jefferson's election.

Burr during the time remained quietly away. He made no effort in his own behalf, but rumours that he had tried to wrest the presidency from his chief became so strong that the loyalty of his party was lost to him, and Jefferson distrusted him. As vice-president, however, he presided over the Senate with a fairness and dignity recognized even by his bitterest enemies. In 1804 he tried to retrieve his political fortunes by running for the governorship of New York. Many of the declining Federalist party wished to support Burr, the latter having become somewhat Federalist in his sympathies, but again Hamilton threw his influence against him as a "dangerous" man of whom he "could detail . . . a still more despicable opinion."

Burr, smarting under this final defeat, and under many assaults upon his character, demanded an explanation of these words from Hamilton. Hamilton quibbled. Burr challenged, and the two met at ten paces at Weehawken. Burr's shot was fatal. But the shot in a sense also killed Burr for it made him an outcast from his country's social and political life. Bereft of all moorings, the man disappeared for some time only to reappear as the instigator of a scheme so daring and exaggerated that it has become one of the legends of American history. Actually Burr had purchased a tract of land in Louisiana and intended to profit by leading a colony of settlers on to it and establishing, perhaps, a new State. Furthermore, in event of a war with Spain, which at that time seemed certain, Burr intended to lead an expedition of his colonists and others into Mexico to win that country for the United States, or for himself. No one was quite sure. Rumours were wildly exaggerated. General James Wilkinson, commander of the army in the west, but really a traitor who had long been in the pay of Spain, told Jefferson that Burr was raising an army to separate the western States from the Union. Jefferson, always suspicious of Burr, had him arrested for treason. A spectacular trial, with John Marshall presiding, was held at Richmond. When the evidence was sifted nothing to prove treasonable actions was found. Though the court in a fair trial found him "not guilty," public opinion would not believe him so, and Burr fled to Europe for four years. Here he lived in pathetic circumstances on borrowed funds, and his morals reached their lowest ebb. He returned to America in answer to the entreaties of his daughter, but the ship bearing her to meet him was lost in a storm and never heard from again. The lone man reopened his law office and for 22 more years gave himself to his profession. In 1833, at the age of 77, he married the wealthy widow Eliza B. Jumel, but the two soon separated. It was Burr's last adventure. He died at Port Richmond, Staten Island, (N.Y.) on Sept. 14, 1836.

Brady, *The Trial of Aaron Burr* (1913); and *The Private Journal of Aaron Burr* (W. H. Sampson, ed., 1903); M. Van Doren, ed., *Correspondence of Aaron Burr and his daughter Theodosia* (1929).

**BURR, THEODOSIA** (1783-1813), brilliant and accomplished daughter of Aaron Burr, was after Mrs. Burr's death the mistress of the Burr mansion, and, although very young, filled that station with grace and dignity. In 1801 she married Joseph Allston, wealthy planter and later governor of South Carolina. She was largely instrumental in paving the way for her father's return from Europe, and embarked from Charleston with her son and only child to meet him, but the vessel in which she sailed was never heard from and probably foundered in a storm off Cape Hatteras.

See M. Minnigerode, "Theodosia Burr, Prodigy," in his *Lives and Times* (1924); G. Bradford, "Theodosia Burr," in *Wives* (1925).

**BURRIANA**, a seaport of eastern Spain, in the province of Castellón de la Plana; on the estuary of the river Seco or Bechi. Pop. (1920), 13,895. The open roadstead of Burriana has a considerable seasonal export trade in oranges grown in the surrounding fertile plain, which is irrigated from the river Mijares, on the north. Large quantities of grain, oil, wine and melons are also produced. Burriana is connected by a light railway with the neighbouring towns of Onda (6,631), Almazra (7,273), Villarreal (16,770) and Castellón de la Plana (34,457).

**BURRITT, ELIHU** (1810-1879), American philanthropist, known as "the learned blacksmith," was born in New Britain (Conn.), on Dec. 8, 1810. For the most part self-taught, by the age of 30 he could read nearly 50 languages, including Latin, Greek, French, Spanish, Italian and German. In 1848 he organized the Brussels Congress of "Friends of Peace," which was followed by annual congresses in Paris, Frankfurt, London, Manchester and Edinburgh. He was U.S. consul at Birmingham from 1865 to 1870. He returned to America and died at New Britain on March 9, 1879.

See *Life*, by Charles Northend, in the memorial volume (1879); and an article by Ellen Strong Bartlett in the *New England Magazine* (June, 1897).

**BURROUGHS, JOHN** (1837-1921), American poet and writer on natural history, was born near Roxbury, in Delaware

county (N.Y.), April 3, 1837. In his earlier years he engaged in various pursuits—teaching, journalism, farming, and fruit-raising, and for nine years was a clerk in the treasury department at Washington. After publishing in 1867 a volume of *Notes on Walt Whitman as poet and person* (a subject to which he returned in 1896 with his *Whitman: a Study*) he began in 1871, with *Wake-Robin*, a series of books on birds, flowers, and rural scenes which has made him the successor of Thoreau as a popular essayist on the plants and animals environing human life. His later writings showed a more philosophic mood and a greater disposition toward literary or meditative allusion than their predecessors, but the general theme and method remained the same. His chief books, in addition to *Wake-Robin*, are *Birds and Poets* (1877), *Locusts and Wild Honey* (1879), *Signs and Seasons* (1886), and *Ways of Nature* (1905); these are in prose, but he wrote much also in verse, a volume of poems, *Bird and Bough*, being published in 1906. *Winter Sunshine* (1875) and *Fresh Fields* (1884) are sketches of travel in England and France. Until his death, March 29, 1921, while returning from California to his country home in New York State, he continued to write frequent essays on out-of-door life, some of which were assembled in the following volumes: *Time and Change* (1912), *The Summit of the Years* (1913), *The Breath of Life* (1915), *Under the Apple Trees* (1916), and *Field and Study* (1919).

**BIBLIOGRAPHY.**—John Burroughs, *My Boyhood* (1922); *John Burroughs' Talks, His Reminiscences and Comments* as reported by Clifton Johnson (1922); Clara Barrus, *The Life and Letters of John Burroughs* (1925); Clara Barrus, *The Heart of Burroughs' Journals* (1928).

**BURROUGHS ADDING MACHINE COMPANY**, a United States company manufacturing adding and accounting machine equipment situated in Detroit, Mich., and incorporated in 1905. It succeeded the American Arithmometer company which was organized in St. Louis, Mo., in 1886, to manufacture adding machines under patents issued to William Seward Burroughs (b. 1857; d. 1898). Burroughs, who inherited his mechanical ingenuity from his father, started as clerk in a small bank, where he conceived the idea which he later developed into the first commercially successful adding machine. Through improvements and development of new models, the company now manufactures machines which add, subtract, multiply and divide, and also machines designed especially for keeping books of account, for making out bills, and for other specific purposes. At first it was thought that banks would be the only users and that when the then 8,000 banks in the United States had each purchased a machine the market would be saturated, but as the public realized the time to be saved and the reduction in clerical help to be made through the use of such equipment, the field broadened until Burroughs machines are now used by all types of business and in many homes throughout the world. Production has at times exceeded 10,000 machines per month. Up to 1928 over 1,250,000 Burroughs machines had been sold. The adaptation of bank accounting methods to Burroughs machines has resulted in nearly all U.S. banks now using a uniform method of keeping accounts. The company has factories in Detroit, Mich., Windsor, Ont., and Nottingham, England, and sells its product in all civilized countries, either through agents or subsidiary corporations. Capital and surplus June 30, 1928, amounted to \$35,162,674. (S. B.)

**BURROWS, RONALD MONTAGU** (1867-1920), British scholar and archaeologist, was born at Rugby and educated at Charterhouse and Christ Church, Oxford. While assistant to Prof. Gilbert Murray in the Greek department at Glasgow university, 1891-97, he started his excavations at Pylos and Sphacteria (1895-96), which had the important result of vindicating Thucydides as an accurate historian. From 1898 to 1908 he was professor of Greek at University college, Cardiff, and from 1908 to 1913 at Manchester university. In 1905 and 1907 he excavated tombs at Mycalessus (Rhitsona) in Boeotia, thereby systematizing for the first time the study of Boeotian archaeology, and in 1907 published *The Discoveries in Crete*. From 1913 until his death he was principal of King's college, London, being the first layman to hold that post. From 1913 onwards he was the leading British philhellene, having "discovered" Venizelos in 1912, and

being invited by Venizelos during the World War (1916) to be the semi-official diplomatic representative in London of the Greek Provisional Government. In 1915 the British cabinet adopted his plan for bringing Greece into the war by the offer of Cyprus. Confidant and adviser of Venizelos, he wrote and lectured extensively on Near Eastern political problems. At King's college, he founded the many chairs concerned with European history and literature, and the School of Slavonic Studies.

See George Glasgow, *Ronald Burrows: A Memoir*, with foreword by E. K. Venizelos.

**BURRUS, SEXTUS AFRANIUS**, Roman general, was appointed *praefectus praetorio* by Claudius in A.D. 52, on the recommendation of Agrippina, who thought one head of the praetorian cohorts would be more amenable than two. He was joint tutor to Nero with Seneca, and organized Nero's acclamation by the praetorians on the death of Claudius (55). He opposed the executions ordered by Agrippina at the opening of the reign, and so long as he and Seneca kept their influence the reign of Nero was brilliantly successful. But in A.D. 60 Burrus refused to assist in the murder of Agrippina, and again opposed the murder of Octavia, Nero's wife, and Nero began to find him irksome. He died in A.D. 63. Tacitus alone gives Nero the benefit of the doubt whether his death was really due to poison. After his death Seneca by himself was helpless, and Nero ran his course unchecked.

See Tac. Ann. XII.-XIV.; Dio., XLII., 13; C.I.L. XII., 5842.

**BURSAR**, literally a keeper of the *bursa* or purse (M.Lat. *bursarius*). The word is now chiefly used of the official, usually one of the fellows, who administers the finances of a college, or of the treasurer of a school or other institution. The term is also applied to the holder of "a bursary," an exhibition at Scottish schools or universities, and also in England to a scholarship or exhibition enabling a pupil of an elementary school to continue his education at a secondary school.

**BURSCHENSCHAFT**, an association of students at the German universities. It was formed as a result of the German national sentiment awakened by the War of Liberation, its object being to foster patriotism and Christian conduct, as opposed to the particularism and low moral standard of the old *Landsmannschaften*. It originated at Jena, under the patronage of the Grand Duke of Saxe-Weimar, and rapidly spread, the *Allgemeine deutsche Burschenschaft* being established in 1818. The loud political idealism of the *Burschen* excited the fears of the reactionary powers, which culminated after the murder of Kotzebue (q.v.) by Karl Sand in 1819, a crime inspired by a secret society among the *Burschen* known as the Blacks (*Schwarzen*). Nominally suppressed by the Carlsbad Decrees (q.v.) and again in 1833, it lived on until, in 1848, all laws against it were abrogated. The *Burschenschaften* henceforth became purely social and non-political societies.

**BURSLER**, industrial town of Staffordshire, England, in the Potteries district, 150m. N.W. from London, on the L.M.S. railway and the Grand Trunk Canal. Pop. of parish (1891) 31,999; (1921) 41,566. In the 17th century the town was already famous for its manufacture of pottery. Here Josiah Wedgwood was born in 1730, his family having practised the manufacture in this locality for several generations, while he himself began work independently at the Ivy House pottery in 1759. He is commemorated by the Wedgwood Institute, founded in 1863. The neighbouring towns of Stoke, Hanley and Longton are connected with Burslem by tramways. Burslem is mentioned in Domesday. It was included in the county borough of Stoke-on-Trent under an act of 1908. For purposes of parliamentary representation it forms the Burslem Division of the county borough of Stoke-on-Trent.

**BURTON, SIR FREDERICK WILLIAM** (1816-1900), Irish painter and art connoisseur, and for 20 years director of the National Gallery in London. He was responsible for a large number of important purchases for the collection, among them Leonardo da Vinci's "Virgin of the Rocks," Raphael's "Ansidei Madonna," Holbein's "Ambassadors," Van Dyck's equestrian portrait of Charles I., and the "Admiral Pulido Pareja," by Velasquez; and he added largely to the noted series of Early Italian pictures. He died in Kensington on March 16, 1900.

**BURTON, JOHN HILL** (1809-1881), Scottish historian, was born at Aberdeen on Aug. 22, 1809. He qualified for the Scottish bar and practised as an advocate. His *Manual of the Law of Scotland* (1839) brought him into notice; he joined Sir John Bowring in editing the works of Jeremy Bentham, and for a short time was editor of the *Scotsman*, which he committed to the cause of free trade. In 1846 he achieved high reputation by his *Life of David Hume*, based upon extensive and unused ms. material. In 1847 he wrote his biographies of Simon, Lord Lovat, and of Duncan Forbes, and in 1849 prepared for Chambers's Series manuals of political and social economy and of emigration. He contributed largely to the *Scotsman* and *Blackwood*, writing *Narratives from Criminal Trials in Scotland* (1852), *Treatise on the Law of Bankruptcy in Scotland* (1853), and publishing in the latter year the first volume of his *History of Scotland*, which was completed in 1870. A new and improved edition of the work appeared in 1873. He had in 1854 been appointed secretary to the prison board, an office which gave him entire pecuniary independence. Two volumes of the *National Scottish Registers* were published under his supervision. His last work, *The History of the Reign of Queen Anne* (1880), is very inferior to his *History of Scotland*. He died on Aug. 10, 1881.

A memoir of Hill Burton by his wife was prefaced to an edition of *The Book Hunter* which was published in Edinburgh (1882).

**BURTON, SIR RICHARD FRANCIS** (1821-90), British consul, explorer and orientalist, was born at Torquay, March 19, 1821, and baptized at Elstree, Herts. He came of the Westmorland Burtons of Shap, but his grandfather, the Rev. Edward Burton, settled in Ireland as rector of Tuam, and his father, Lieut.-Col. Joseph Netterville Burton, of the 36th Regiment, was an Irishman by birth and character. His mother was descended from the MacGregors, and he was proud of a remote drop of Bourbon blood piously believed to be derived from a morganatic union of the Grand Monarque. There were even those, including some of the Romany themselves, who saw gipsy written in his peculiar eyes as in his character, wild and resentful, essentially vagabond, intolerant of convention and restraint.

His irregular education strengthened the inherited bias. A childhood spent in France and Italy, under scarcely any control, fostered the love of untrammelled wandering and a marvellous fluency in continental vernaculars. Such an education so little prepared him for academic proprieties, that when he entered Trinity college, Oxford, in Oct. 1840, a criticism of his military moustache by a fellow undergraduate instigated a challenge to a duel, and Burton in various ways distinguished himself by such eccentric behaviour that rustication inevitably ensued. Nor was he much more in his element as a subaltern in the 18th Regiment of Bombay Native Infantry, which he joined at Baroda in Oct. 1842. Discipline of any sort he abhorred, and the one recommendation of the East India Company's service in his eyes was that it offered opportunities for studying oriental life and languages. He had begun Arabic without a master at Oxford, and worked in London at Hindustani under Forbes before he went out; in India he laboured indefatigably at the vernaculars, and his reward was an astonishingly rapid proficiency in Gujarati, Marathi and Hindustani, as well as Persian and Arabic.

His appointment as an assistant in the Sind survey enabled him to mix with the people, and he frequently passed as a native in the bazaars and deceived his own *munshi*, to say nothing of his colonel and messmates. His wanderings in Sind were the apprenticeship for the pilgrimage to Mecca, and his seven years in India laid the foundations of his unparalleled familiarity with eastern life and customs, especially among the lower classes. Besides Government reports and contributions to the Asiatic Society, his Indian period produced four books, published after his return home: *Scinde, or the Unhappy Valley* (1851), *Sindh and the Races that Inhabit the Valley of the Indus* (1851), *Goa and the Blue Mountains* (1851), and *Falconry in the Valley of the Indus* (1852). None of these achieved popularity, but the account of Sind is remarkably vivid and faithful.

The pilgrimage to Mecca in 1853 made Burton famous. He had planned it whilst mixing disguised among the Muslims of

Sind, and had laboriously prepared for the ordeal by study and practice. No doubt the primary motive was the love of adventure, which was his strongest passion; but along with the wanderer's restlessness marched the zest for exploration, and whilst wandering was in any case a necessity of his existence, he preferred to roam in untrodden ways where mere adventure might be dignified by geographical service. There was a "huge white blot" on the maps of central Arabia where no European had ever been, and Burton's scheme, approved by the Royal Geographical Society, was to extend his pilgrimage to this "empty abode," and remove a discreditable blank from the map. War among the tribes curtailed the design, and his journey went no farther than Medina and Mecca. The exploit of accompanying the Muslim hajj to the holy cities was not unique, nor so dangerous as has been imagined. Several Europeans have accomplished it before and since Burton's visit without serious mishap. Passing himself off as an Indian Pathan covered any peculiarities or defects of speech. The pilgrimage, however, demands an intimate proficiency in a complicated ritual, and a familiarity with the minutiae of eastern manners and etiquette; and in the case of a stumble, presence of mind and cool courage may be called into request.

There are legends that Burton had to defend his life by taking others'; but he carried no arms, and confessed, rather shamefacedly, that he had never killed anybody at any time. The actual journey was less remarkable than the book in which it was recorded, the *Pilgrimage to Al-Medīnah and Meccah* (1855). Its vivid descriptions, pungent style, and intensely personal "note" distinguish it from books of its class; its insight into Semitic modes of thought and its picture of Arab manners give it the value of an historical document; its grim humour, keen observation and reckless insobriety of opinion, expressed in peculiar, uncouth but vigorous language make it a curiosity of literature.

Burton's next journey was more hazardous than the pilgrimage, but created no parallel sensation. In 1854 the Indian Government accepted his proposal to explore the interior of the Somali country, which formed a subject of official anxiety in its relation to the Red sea trade. He was assisted by Capt. J. H. Speke and two other young officers, but accomplished the most difficult part of the enterprise alone. This was the journey to Harrar, the Somali capital, which no white man had entered. Burton vanished into the desert, and was not heard of for four months. When he reappeared, he had not only been to Harrar, but had talked with the king, stayed ten days there in deadly peril, and ridden back across the desert, almost without food and water, running the gauntlet of the Somali spears all the way. Undeterred by this experience, he set out again, but was checked by a skirmish with the tribes, in which one of his young officers was killed, Captain Speke was wounded in 11 places, and Burton himself had a javelin thrust through his jaws. His *First Footsteps in East Africa* (1856), describing these adventures, is one of his most exciting and most characteristic books, full of learning, observation and humour.

After serving on the staff of Beatson's Bashi-bazouks at the Dardanelles, but never getting to the front in the Crimea, Burton returned to Africa in 1856. The Foreign Office, moved by the Royal Geographical Society, commissioned him to search for the sources of the Nile, and, again accompanied by Speke, he explored the lake regions of equatorial Africa. They discovered Lake Tanganyika in Feb. 1858, and Speke, pushing on during Burton's illness and acting on indications supplied by him, lighted upon Victoria Nyanza. The separate discovery led to a bitter dispute, but Burton's expedition, with its discovery of the two lakes, was the incentive to the later explorations of Speke and Grant, Baker, Livingstone and Stanley; and his report in volume xxxiii. of the *Proceedings of the Royal Geographical Society*, and his *Lake Regions of Equatorial Africa* (1860), are the true parents of the multitudinous literature of "darkest Africa."

Burton was the first Englishman to explore Somaliland, the first to discover the great lakes of central Africa, and one of the first to enter Mecca. His East African pioneering coincides with areas which have since become peculiarly interesting to the British empire; and three years later he was exploring on the opposite

side of Africa, at Dahomey, Benin and the Gold coast, regions which have also entered among the imperial "questions" of the day. Before middle-age Burton had compressed into his life, as Lord Derby said, "more of study, more of hardship, and more of successful enterprise and adventure, than would have sufficed to fill up the existence of half a dozen ordinary men." *The City of the Saints* (1861) was the fruit of a flying visit to the United States in 1860.

Since 1849 his connection with the Indian army had been practically severed; in 1861 he definitely entered the service of the Foreign Office as consul at Fernando Po, whence he was shifted successively to Santos in Brazil (1865), Damascus (1869), and Trieste (1871), holding the last post till his death Oct. 20 1890. Each of these posts produced its corresponding books: Fernando Po led to the publishing of *Wanderings in West Africa* (1863), *Abeokuta and the Cameroons* (1863), *A Mission to Gelele, king of Dahomé* (1864), and *Wit and Wisdom from West Africa* (1865). *The Highlands of the Brazil* (1869) was the result of four years' residence and travelling; and *Letters from the Battlefields of Paraguay* (1870) related to a journey across South America to Peru. Damascus suggested *Unexplored Syria* (1872), and might have led to much better work, since no consulate in either hemisphere was more congenial to Burton's taste and linguistic studies; but he mismanaged his opportunities, got into trouble with the Foreign Office, and was removed to Trieste, where his oriental prepossessions and prejudices could do no harm, but where, unfortunately, his oriental learning was thrown away.

He did not, however, abandon his eastern studies or his eastern travels. Various fresh journeys or revisitations of familiar scenes are recorded in his later books, such as *Zanzibar* (1872), *Ultima Thule* (1875), *Etruscan Bologna* (1876), *Sind Revisited* (1877), *The Land of Midian* (1879) and *To the Gold Coast for Gold* (1883). None of these had more than a passing interest. Burton had not the charm of style or imagination which gives immortality to a book of travel. He wrote too fast, and took too little pains about the form. His blunt, disconnected sentences and ill-constructed chapters were full of information and learning, and contained not a few thrusts for the benefit of government or other people, but they were not "readable." There was something ponderous about his very humour, and his criticism was personal and savage.

By far the most celebrated of all his books is the translation of the "Arabian Nights" (*The Thousand Nights and a Night*, 16 vols., privately printed, 1885-88), which occupied the greater part of his leisure at Trieste. As a monument of his Arabic learning and his encyclopaedic knowledge of eastern life, this translation was his greatest achievement. It is open to criticism in many ways; it is not so exact in scholarship, nor so faithful to its avowed text as might be expected from his reputation; but it reveals a profound acquaintance with the vocabulary and customs of the Muslims, with their classical idiom as well as their most vulgar "Billingsgate," with their philosophy and modes of thought as well as their most secret and most disgusting habits.

Burton's "anthropological notes," embracing a wide field of pornography, apart from questions of taste, abound in valuable observations based upon long study of the manners and the writings of the Arabs. The translation itself is often marked by extraordinary resource and felicity in the exact reproduction of the sense of the original; Burton's vocabulary was marvellously extensive, and he had a genius for hitting upon the right word; but his fancy for archaic words and phrases, his habit of coining words, and the harsh and rugged style he affected, detract from the literary quality of the work without in any degree enhancing its fidelity.

With various grave defects, but sometimes brilliant merits, the translation holds a mirror to its author. He was, as has been well said, an Elizabethan born out of time; in the days of Drake his very faults might have counted to his credit.

Of his other works, *Vikram and the Vampire*, *Hindu Tales* (1870), and a history of his favourite arm, *The Book of the Sword*, vol. i. (1884), unfinished, may be mentioned. His trans-

lation of *The Lusads of Camoens* (1880) was followed (1881) by a sketch of the poet's life. Burton had a fellow-feeling for the poet adventurer, and his translation is an extraordinarily happy reproduction of its original. A manuscript translation of the "Scented Garden," from the Arabic, was burned by his widow, acting in what she believed to be the interests of her husband's reputation. Burton married Isabel Arundell in 1861, and owed much to her courage, sympathy and passionate devotion. Besides her *Life*, other monuments of her devotion to his memory are the Arab tent of stone and marble that she built for his mausoleum at Mortlake, and the "Burton Memorial Lecture Fund," which was inaugurated in 1921 and presents (through the Royal Asiatic Society) a triennial medal to a prominent explorer of the lands with which Burton was associated.

**BIBLIOGRAPHY.**—Besides Lady Burton's *Life* (1893; abridged edn. 1898) there are:—*A Sketch of the Career of R. F. B.*, by A. B. Richards, A. Wilson, and St. C. Baddeley (1886); *The True Life of Captain Sir R. F. B.*, by his niece, G. M. Stisted (1896); a *Life* by Thos. Wright of Olney (1906), an industrious and rather critical work which casts doubt on Burton's originality as an Arabic translator and emphasizes his indebtedness to Payne's *Arabian Nights* (1881); *The Real Sir R. B.*, by W. P. Dodge (1907); and a brief sketch by S. Lane-Poole prefixed to the *Pilgrimage* (Bohn, 1898), from which some sentences are here, by permission, introduced. See also N. M. Penzer's *An Annotated Bibliography of Sir R. F. B.* (1923) and *Selected Papers on Anthropology, Travel, etc.* (1924). (S.L.-P.)

**BURTON, ROBERT** (1577–1640), English divine and author of *The Anatomy of Melancholy*, was born at Lindley, Leicestershire, on Feb. 8, 1577. He was educated at Sutton Coldfield and Nuneaton, became a commoner of Brasenose college, Oxford, in 1593, and six years later was elected a student at Christ Church, where he spent the rest of his days. In 1616 he was appointed vicar of St. Thomas's, Oxford, and about 1630 rector of Segrave, Leicestershire. He died on Jan. 25, 1640, having some years previously predicted the year of his death by the calculation of his nativity. His portrait in Brasenose shows the face of a scholar—shrewd, contemplative, humorous.

Burton's first writing, *Philosophaster* (1606), was a Latin comedy and vivacious exposure of charlatanry. It was acted at Christ Church in 1617, but was supposed to be lost, until edited by W. E. Buckley in 1862, together with a number of minor academical exercises. In 1621 appeared *The Anatomy of Melancholy* (by Democritus Junior), revised editions being published in 1624, 1628, 1632, 1638, the sixth edition posthumously printed in 1651 containing Burton's last revision. Sir William Osler has spoken of the *Anatomy* as a "great medical treatise, orderly in arrangement, serious in purpose." But it is much more; it is a mine of information on the life and the thought of the period, covering such diverse topics as the varieties of contemporary sports, current anecdotes, cosmological opinions, and religious theories; and again its abundant quotations from the patristics, the classics, and English authors put before us the gracious erudition of a scholar. In the very extensive preface, Burton declares that he wrote the treatise in order to escape melancholy, and gives his reasons for assuming the name, Democritus Junior. After remarking on the prevalence of madness, even in communities and states, he sketches a Utopia with many practical suggestions, including old-age pensions. The preface is followed by a tabular synopsis of part one. Then, after a brief description of diseases in general, the innumerable causes of melancholy, which differs from madness only in degree, are discussed. Among the natural, as opposed to the supernatural causes, Burton mentions the influence of the stars, heredity, education, bodily ills, accidental states of life, and kinds of food, exhibiting under the subdivision of particular causes a wealth of medical lore. The first part ends with a discussion of suicide. Part two is devoted to the cure of melancholy and sets forth the need of regulating the diet and organic processes, the value of pure air and exercise, the advantages of rectifying dreams, passions and mental perturbations, and the remedial powers of various drugs and of surgery. Part three is occupied firstly with love-melancholy, including an intricate treatise on love, interspersed with famous love-stories from the Bible and from history, and secondly with religious melancholy.

The *Anatomy*, widely read in the 17th century, lapsed for a time into obscurity, but Dr. Johnson greatly admired it, Sterne laid it heavily under contribution, and Charles Lamb found a kindred spirit reflected in it. Of the many editions following those cited above the best is that of A. R. Shilleto (1896), reissued in 1923 in Bohn's Library series. The 1651 edition was elaborately reprinted by the Nonesuch Press in 1925.

See *Robert Burton and the Anatomy of Melancholy*, being papers edit. by F. Madan for the Oxford Bibliographical Society (1926); and *Burton the Anatomist, Being Extracts from the Anatomy, etc.*, edit. by G. C. F. Mead and R. C. Clift (1925).

**BURTON, WILLIAM EVANS** (1804–60), English actor and playwright, born in London in Sept. 1804, was the son of William George Burton (1774–1825), a printer, and author of *Research into the religions of the Eastern nations as illustrative of the scriptures* (1805). He made his first appearance on the London stage in 1831. In 1834 he went to America, where he appeared in Philadelphia as Dr. Ollapod in *The Poor Gentleman*. He took a prominent place, both as actor and manager, in New York, Philadelphia and Baltimore, the theatre which he leased in New York being renamed Burton's theatre. He had much popular success as Captain Cuttle in John Brougham's dramatization of *Dombey and Son*, and in other low comedy parts in plays from Dickens's novels. Burton was the author of a large number of plays, one of which, *Ellen Wareham* (1833), was produced simultaneously at five London theatres. In Philadelphia he established the *Gentleman's Magazine*, of which Edgar Allan Poe was for some time the editor. He edited the *Cambridge Quarterly* and the *Souvenir*, and wrote several books, including a *Cyclopaedia of Wit and Humour* (1857). He collected a library of more than 100,000 volumes, especially rich in Shakespeariana, which was dispersed after his death at New York city on Feb. 9 1860.

**BURTON-OPITZ, RUSSELL** (1875– ), American physiologist, was born in Ft. Wayne, Ind., on Oct. 25, 1875. He graduated in 1895 at the Rush medical college of the University of Chicago and in 1905 received the degree of doctor of philosophy from the same university, having done postgraduate work also at the universities of Vienna and Breslau, in the latter of which he was assistant in physiology from 1898 to 1901. In 1901 he also carried on research at the marine biological laboratory in Naples. He was assistant in physiology in Harvard university in 1901–02 and then joined the faculty of Columbia university in which he was associate professor of physiology from 1909 to 1923 when he became lecturer in physiology and associate professor of medicine in the New York post-graduate medical school.

His publications include a *Text Book of Physiology and Advance Lessons in Physiology* (both 1920) and an *Elementary Manual of Physiology* (1925).

**BURTON-UPON-TRENT**, county borough, Staffordshire, England; lying mainly on the left bank of the river Trent. Pop. (1801) 46,047; (1931) 49,485. It is 127m. N.W. from London and is served by the L.M.S. and L.N.E. railways. The Trent is navigable from a point near the town downward. In the 9th century St. Modwen is said to have established a convent on the Isle of Andressey opposite Burton. In 1002 Wulfic, earl of Mercia, founded here a Benedictine abbey, and by charter of 1004 granted to it the town with other large endowments. Burton was evidently a mesne borough under the abbot, who held the court of the manor and received the profits of the borough according to the charter of Henry I. Later charters were given by Henry II., by John (who also granted an annual fair of three days' duration, and a weekly market on Thursday), by Henry III., by Henry VII., and by Henry VIII. At the dissolution Henry VIII. founded on the site of the abbey a collegiate church dissolved before 1545, when its lands, with all the privileges formerly vested in the abbot, were conferred on Sir William Paget, ancestor of the marquess of Anglesey, now holder of the manor. The famous brewing industry of the town is of comparatively recent development, having begun about 1708. Forty years later it had a market at St. Petersburg and the Baltic ports, and in 1796 there were nine brewing firms in the town. The use

of local well-water impregnated with sulphate of lime derived from gypsum deposits is one factor in the localization of brewing here. Upwards of 6,000 hands are employed in all, and the breweries are in the hands of companies, chiefly Bass and Allsopp. Many people are employed in the subsidiary industries, especially cask making. Metal workers are also an important element in the population. The church of St. Mary and St. Modwen embodies some remains of an ancient Gothic building. Of the Benedictine abbey dedicated to the same saints there remain a gatehouse and lodge, and a fine doorway. The former abbot's house at Seyney Park is a half-timbered building of the 15th century. The free grammar school was founded in 1525. A fine bridge over the Trent, and the municipal buildings, were provided by Lord Burton. There are recreation grounds on the Derbyshire side of the river.

Burton was incorporated in 1878, is governed by a mayor, eight aldermen and 24 councillors, and is in the Burton Parliamentary Division of Staffordshire. Area 4,203 acres.

**BURU** (Dutch, *Boeroe*), an island of the Moluccas, Dutch East Indies, between 3° 4' and 3° 50' S., and 125° 58' and 127° 15' E. It belongs to the residency of Amboyna and stands on the outer wall of Archæan rocks which encloses the symmetrical inner volcanic ring to which the Banda Islands and some of the south-western islands belong. Oval in shape, it is 90m. long, 50 wide, and in area 3,400 sq. miles. It has high mountains, especially in the north-west, where Mt. Tomahu reaches 8,254ft., whilst Kaku Siel is almost as high. In the centre of the island there is the large Lake Waikolo, at an altitude of 2,000ft., which has no affluents, and only one outlet, the Wai Nibe, on the north. In the east the mountains are comparatively low, and surrounding Kayeli Bay is a wide, circular, level plain. Crystalline slate occurs in the north, and mesozoic sandstone and chalk in the south; deposits which are rare in the Archipelago. Most of the island is covered by forest with teak, ebony, and kanari, but the north is bare of trees and overgrown with coarse *kussu* grass, whilst in swampy parts about Lisela, Kayeli, and Waesama sago palms are abundant. Ambelau Island (sago palms and coconuts) lies off the south-east coast. The mammals of Buru include two very interesting specimens—the *babi-rusa*, or pig-deer (vouched for by A. R. Wallace, whose hunters killed one during his residence in Buru), and the black, crested baboon (*Cynopithecus nigrescens*). Among birds it has kingfishers (*Ceryx cajeli*), flycatchers, honey suckers, orioles, and a beautiful sunbird (*Nectarinea proserpina*), also a rare species of *Megapodius*, or mound-builder (*Megapodius wallacei*). The indigenous people of Buru are Alfurs, resembling the Alfurs of Ceram. Agriculture is poor, but a few villages have coconut plantations. The coast has people from Buton, Amboyna, the Sula Islands, and other neighbouring coasts, together with some Alfurs, Arabs, and Chinese. Most are Mohammedans, but there are probably 2,000 or 3,000 Christians. The total population is estimated at 20,000. The Christians live mostly on the south and south-west coasts and the Mohammedans about Kayeli. The chief industry is the manufacture of cajeput oil, from distillation from the leaves of the wild *Melaleuca cajeputi* in Kayeli and other villages along the north coast by Chinese, Arabs, and Sulanese. Millet is grown, and coal is reported to exist. Namlea, on Kayeli Bay, is the chief port, and vessels of the Royal Mail Packet Company call here and at Leksula, on the south-west coast. Ambelau Island has a Mohammedan population of 1,300; the people live by fishing and trading with neighbouring islands. In former times the sultan of Ternate claimed a suzerainty over Buru, and when, in 1683, the Dutch repudiated all their contracts with that monarch, Buru, already possessing a small Portuguese fort at Kayeli, was regarded by the Dutch as open for exploitation.

See A. R. Wallace, *The Malay Archipelago* (1890).

**BURUJIRD**, a province of Persia embracing a large part of Luristan (*q.v.*), bounded on the south by Khuzistan and extending to the frontier of Iraq on the west. It lies mostly in the upper reaches of the Kerkha and Diz rivers and has the distinction of being one of the most mountainous districts of Persia, consisting of a series of parallel ranges running north-west to south-east with fertile valleys intervening. It is inhabited almost

exclusively by nomads, and to the south-west are to be found some of the finest grazing grounds in Persia. The revenue in 1926–27 amounted to 2½ million krans (about £60,000). The province is likely to be of particular importance in the future as the shortest route from the head of the Persian gulf to the capital runs through it, while from Burujird itself Kermanshah, Hamadan, and Isfahan, are easily accessible by roads now made practicable for motor-cars. A motor road from Dizful to Khoramabad is in course of construction (1927) and a railway from Mohammerah to Tehran via Dizful and Burujird is under contemplation.

Burujird town, the administrative headquarters of the province (33° 55' N. and 48° 55' E.), is situated upon a tributary of the Ab-i-Diz, at an elevation of 5,500 feet. The population is estimated at about 22,000. The town has become a distributing centre of some importance since comparative security has been restored in Luristan. The chief industries of the district are the making of carpets of inferior quality and of various kinds of native cotton stuffs, which supply the simple needs of the villages and nomad tribes in the district.

**BURUN.** The Burun, inhabiting the extreme southern portion of the Sudan and the hills north of the Khor Yabus, are a tall race whose men go naked and whose women wear a small apron. Knowledge of the Burun is limited to measurements and photographs taken by the late Dr. Pirrie. These people differ in habits and customs from the river negroids, live in small widely separated huts, have no cattle, use the bow and poisoned arrows and carry throwing sticks. Measurements and photographs suggest that the Burun nearly approach the Nuba of southern Kordofan.

**BURUSHASKI LANGUAGE.** Burushaski (*Borushaski*) is the mother tongue of some 17,600 people inhabiting the central portion of the states of Hunza and Nagir which lie to the north of Kashmir where the Hindu Kush and Karakoram ranges meet.

A distinct dialect, known as Werchikwār (*Wərčikwār*) or Wershikwār, is spoken by the (some 7,000) people of Wershegūm, part of the Yasin valley.

No affinity has yet been proved between Burushaski, and any other language.

The principal sounds of Burushaski are:

|                |    |   |    |   |    |   |    |    |    |   |    |             |
|----------------|----|---|----|---|----|---|----|----|----|---|----|-------------|
| Vowels         | a  | Δ | ə  | æ | ε  | e | i  | ɪ  | o  | u | ai | (æi and əi) |
| and the longer | a' |   | e' |   | i' |   | o' |    | u' |   |    |             |
| Consonants     | k  | χ | g  | γ | q  | ŋ | t  | d  | n  | p | f  | (pf) b w m  |
|                | č  | j | y  | s | z  | š | ž  | ts | l  | r |    |             |

There is also a series of sounds made with tip of the tongue retracted which may amount in some cases to "cerebrals" on the stricter definition of the term. So

č j š ž

Natives recognize ɖ (passing into medial ɖ).

There is a curious sound which seems to be a cerebral or retracted y.

Natives claim to recognize the aspirates: kh th ph čh jh. In a few words there appears to be a velar g corresponding to q. Werchikwār has an additional l, probably cerebral.

|         |   |   |   |   |     |   |
|---------|---|---|---|---|-----|---|
| Initial | g | d | b | γ | and | w |
|         | k | t | p | q | and | p |

after certain prefixes.

Among the many distinctive features of grammar and construction are the following:—

**Nouns** are divided into four categories according as they represent: male human beings (mh), female human beings (fh), animals of both sexes and some inanimate objects (x), the remaining inanimate objects (y).

The principles underlying the differentiation of the x and y categories cannot at present be fully stated but in general names of fruit and wood and articles made of wood are x. Names of liquids, plastic and finely divided substances, trees, metals, abstract ideas and "immaterial" objects are y.

The following vary to a greater or less extent, according to the category of the noun to which they refer:

1. Plural suffixes of nouns (and occasionally adjectives).
2. Demonstrative pronouns and adjectives.
3. Third person singular and plural of the finite tenses of verbs.

Case inflection is effected by the use of suffixes and postpositions.

**Agglutinative Pronouns** are used as pronominal prefixes with certain nouns and verbs. With nouns they indicate the possessor, with intransitive verbs the subject, and with transitive verbs sometimes the direct, sometimes the indirect object, and occasionally the subject. With a large series of verbs they are used as infixes after an initial d.

**Verbs** are conjugated by the use of terminal inflections added to two bases, present and past. The imperative is founded on the past base.

Transitive and causative verbs are formed from intransitive verbs by prefixing an element \*—A— or \*—AS— (\*— indicates the presence of a pronominal prefix).

**Numerals.**—The numeral system consists of a series of numbers from 1 to 10. The numbers from 20 to 99 are based on the numbers 20 and 40, to which are added the numbers 1 to 19, while 20 and 40 are themselves multiplied as required by a preceding number, e.g., 95 = 2 × 40 + (10 + 5). The element of 2 is emphasized: 2, 4, 8, 20 and 40 being all obviously related. There is a special series of forms of the numerals used in counting, as multipliers and with certain nouns of measure, etc.

The numbers 1 and 3 are also differentiated for h as opposed to x and y, and 2 has special forms for h, x and y.

**Vocabulary.**—Excluding obvious loan words taken chiefly from Persian, Şīna and Khawār, the vocabulary of Burushaski and the whole of its inflectional system are, so far as is known, peculiar to itself. It would probably be impossible to point out an alien among its pronouns, numerals (except sa's 1,000), verbs and nouns relating to the common objects of daily life.

**BIBLIOGRAPHY.**—*The Linguistic Survey of India* (vol. viii., ii., Calcutta, 1919), has a bibliography of works relating to Burushaski and Werchikwār; D. L. R. Lorimer, "A Burushaski Text from Hunza" *Bulletin of the School of Oriental Studies*, iv. 3, 1927, pp. 505–531; I. Zarubin, "Vershikskoe Narechie Kandzhutskovo Yazika," *Zapiski Kollegii Vostokovedov, Akademii Nauk*, ii. 2. pp. 275–364, 1927, an important work on Werchikwār, with a bibliography including Russian authorities and documents. (D. L. R. L.)

**BURY, JOHN BAGNELL** (1861–1927), British historian, was born Oct. 16, 1861, and was educated at Trinity college, Dublin, where he was elected to a fellowship in 1885. A fine Greek scholar, he edited Pindar's *Nemean and Isthmian Odes*; but he devoted himself chiefly to the study of history, and was chosen professor of modern history at Dublin in 1893, becoming regius professor of Greek in 1898. He resigned both positions in 1902, when he was elected regius professor of modern history in the university of Cambridge. His historical work was mainly concerned with the later Roman empire, and his edition of Gibbon's *Decline and Fall*, with a masterly introduction and valuable notes (1896–1900) is the standard text. He also wrote histories of *The Roman Empire*, 27 B.C.–180 A.D. (1893), *Greece to the Death of Alexander the Great* (1900), *The Eastern Roman Empire*, 802–867 (1912), and *The Later Roman Empire*, 395–565 (1923); a *Life of St. Patrick* (1905); *The Invasion of Europe by the Barbarians* (1928); etc. He died in Rome June 1, 1927. See the *Bibliography*, with *Memoir* by N. H. Baynes (1929).

**BURY, RICHARD DE:** see AUNGERVILLE, RICHARD.

**BURY**, municipal county and parliamentary borough, Lancashire, England, on the River Irwell, 10½ m. N. by W. of Manchester, on the L.M.S. railway and the Manchester and Bolton canal. Pop. (1931) 56,186. Bury, of which the name is derived from the Anglo-Saxon burh, birig or byrig (town, castle or fortified place), was the site of a Saxon station, and an old English castle stood in Castle Croft close to the town. It was a member of the Honour of Clitheroe and a fee of the royal manor of Tottington, which soon after the Conquest was held by the Lacys. The church of St. Mary is an early foundation, mention of a church being made in Domesday. The present building dates from 1876. One half of the town is glebe belonging to the rectory.

Under a grant made by Edward IV. to Sir Thomas Pilkington, fairs are still held on March 5, May 3, and Sept. 18, and a market, formerly held under the same grant on Thursday, is now held on Saturday. The woollen trade was established here through the agency of Flemish immigrants in the reign of Edward III., and in Elizabeth's time this industry was of such importance that an *aulneger* was appointed to measure and stamp the woollen cloth. But although the woollen manufacture is still carried on, the cotton trade has been gradually superseding it since the early part of the 18th century. The family of the Kays, the inventors, belonged to this place, and Robert Peel's print-works were established here in 1770. The cognate industries of calico printing, dyeing and bleaching are carried on, and there are iron foundries and machinery works. Kay's free grammar school was founded in 1726. An important business experiment established the well-known Bury Co-operative Society in 1856.

Until 1846 the town was governed by three constables chosen annually at the court leet. A charter of incorporation was granted in 1876, and the county borough created in 1888. The corporation consists of a mayor, ten aldermen and 30 councillors. Bury, together with the urban district of Tottington, returns one member to Parliament. Area of borough 5,925 acres.

**BURY ST. EDMUNDS**, municipal borough, West Suffolk, England, 87 m. N.E. by N. of London by the L.N.E. railway. Pop. (1931) 16,708. It is situated on the River Lark, a tributary of the Great Ouse, in a fertile and richly cultivated district. The settlement (Beodricesworth) was one of the royal towns of the Saxons, and may have occupied the site of a Roman villa. Sigebert, king of the East Angles, founded a monastery here about 633, which in 903 became the burial place of King Edmund, who was slain by the Danes about 870. It owed its early celebrity to the reputed miracles performed at the shrine of the martyr king. By 925 the fame of St. Edmund had spread far and wide, and the name of the town was changed to St. Edmund's Bury. Sweyn, in 1020, having destroyed the older monastery and ejected the secular priests, built a Benedictine abbey on its site. King Edmund had

BY COURTESY OF THE SOCIETY OF ANTIQUARIES OF LONDON

**THE MARTYRDOM OF ST. EDMUND** Slain by the Danes about A.D. 870, St. Edmund, the last king of the East Angles, was buried in the borough which now bears his name, in A.D. 903

granted to the abbot and convent jurisdiction over the whole town, free from all secular services; and Canute in 1020 freed it from episcopal control. By various grants from the abbots, the town gradually attained the rank of a borough. Henry III., in 1235, granted two annual fairs, one in the month of December (which still survives), the other, the great St. Matthew's fair, which was abolished by the Fairs act of 1871. Another fair was granted in 1405. In 1606 a charter of incorporation was granted, with an annual fair in Easter week and a market. Further charters date from the 17th century. Remains of the great abbey include the church gate, one of the finest specimens of early Norman architecture in England, the western gate (Decorated) and ruined walls. St. Mary's church has a beautifully carved roof and is of 15th century date, while St. James's is also Perpendicular. These remarkable buildings front one of the main streets. The free grammar school dates from the time of Edward VI.

Bury St. Edmunds formerly had a large woollen trade. The agricultural trade is important, cattle and corn markets being held; while there are agricultural implement works. The town is governed by a mayor, six aldermen and 18 councillors. Area 2,947 acres. For purposes of parliamentary representation it is included in the Bury St. Edmunds division of the administrative county of West Suffolk.

**BUSBECQ, OGIER GHISLAIN DE** (1522–1592), Flemish author, ambassador of the emperor Ferdinand I. at Constantinople, was born at Comines, Flanders, natural son of the lord of Busbecq. After serving under Charles V. he entered the service of Ferdinand of Austria, king of the Romans, and was sent by him to the court of Suleiman the Magnificent in 1555 and again in 1556, where he suffered imprisonment and ill-treatment at the hands of the Sultan, whose mind had been poisoned against him by the French ambassadors. Finally, however, he succeeded in framing terms of peace, which were ratified on his return to Vienna in 1562. After this he held various posts at the imperial court, Ferdinand having succeeded his brother Charles V. as emperor. He collected Greek mss. (now in the national library at Vienna), coins, Greek inscriptions, and introduced various plants into Germany. He also discovered the Monumentum Ancyranum; in the Crimea he found a community of Goths still retaining the Gothic customs and languages.

**BIBLIOGRAPHY.**—Busbecq's *Itinera Constantinopolitum et Amasianum* (Antwerp 1581 and 1582, Paris 1589 under the title *A. G. Busbequii Legationis Turcicae Epistolae IV.*) is an important source for the history of Turkey at this time; Eng. trans., by E. S. Forster (1927); his *Epistolae ad Rudolphum II., Imperatorem a Gallia scriptae* (Louvain, 1630) describe the French court.

**BUSBY, RICHARD** (1606–95), headmaster of Westminster school, was born at Luton in Lincolnshire in 1606. He was educated at Westminster school and Christ Church, Oxford, where he graduated in 1628. He was rewarded in 1639 for his services to the Stuart cause with the prebend and rectory of Cudworth, with the chapel of Knowle annexed, in Somersetshire. Next year he became headmaster of Westminster, a post which he retained till his death, at the age of 90. He himself once boasted that 16 of the bishops who then occupied the bench had been birched with his "little rod." Among the more illustrious of his pupils may be mentioned South, Dryden, Locke, Prior and Bishop Atterbury. He wrote and edited many works for the use of his scholars, notably his Greek and Latin grammars. He died on April 6, 1695.

**BUSBY**, the fur cap, decorated with plume and busby-bag, which forms part of the full-dress uniform of Hussars and Royal Horse Artillery. (See also UNIFORMS.)

**BUSCH, MORITZ** (1821–1899), German publicist, was born at Dresden. After a visit to the United States (1851–52), described in *Wanderungen zwischen Hudson und Mississippi* (1853), he travelled extensively in the East and wrote books on Egypt, Greece and Palestine. From 1856 he was employed at Leipzig on the *Grenzboten*, which, under Gustav Freytag, had become the organ of the Nationalist Party. He was closely connected with the Augustenburg Party in Schleswig-Holstein, but after 1866 he transferred his services to the Prussian Government, and was employed in a semi-official capacity in Hanover. From 1870 onwards he was one of Bismarck's press agents, and accompanied him during the campaign of 1870–71. In 1878 he published the first of his works on Bismarck—*Graf Bismarck und seine Leute, während des Krieges mit Frankreich*, followed by *Neue Tagebuchblätter* (1879) and *Unser Reichskanzler* (1884), chiefly dealing with the work in the foreign office in Berlin. Immediately after Bismarck's death Busch published the chancellor's famous petition to the emperor William II., dated March 18, 1890, requesting to be relieved of office. This was followed by *Bismarck und sein Werk* (1898); and, in London and in English, by the famous memoirs entitled, *Bismarck: some Secret Pages of his History*, in which were reprinted the whole of the earlier works, with a considerable amount of new matter, passages from the earlier works which had been omitted because of the attacks they contained on people in high position, records of later conversations, and some important letters and documents which had been entrusted to him by Bismarck. Many passages were of such a nature that it could not be safely published in Germany; but in 1899 a far better and more complete German edition was published at Leipzig.

See Ernst Goetz, in *Biog. Jahrbuch* (1900).

**BUSCH, WILHELM** (1832–1908), German caricaturist, was born at Wiedensahl in Hanover on April 15, 1832, and died on Jan. 9, 1908. After studying at the academies of Düsseldorf, Antwerp and Munich, he joined in 1859 the staff of *Fliegende*

*Blätter*, the leading German comic paper, and was, together with Oberländer, the founder of modern German caricature. His humorous drawings and caricatures are remarkable for the extreme simplicity and expressiveness of his pen-and-ink line, which record with a few rapid scrawls the most complicated contortions of the body and the most transitory movement. His humorous illustrated poems, such as *Max und Moritz*, *Der heilige Antonius von Padua*, *Die Fromme Helene*, *Hans Hucklebeim* and *Die Erlebnisse Knopps des Junggesellen*, play, in the German nursery, the same part that Edward Lear's nonsense verses do in England. He invented the series of comic sketches illustrating a story in scenes without words, which have inspired Caran d'Ache and his successors.

See monograph by K. W. Neumann (1919).

**BÜSCHING, ANTON FRIEDRICH** (1724–1793), German geographer, was born at Stadthagen, Schaumburg-Lippe, on Sept. 27, 1724; professor of philosophy at Göttingen (1754–57), pastor of the German congregation and director of a flourishing school at St. Petersburg (1761–65), and from 1766 onwards director of the *Gymnasium zum Grauen Kloster*, founded at Berlin by Frederick the Great. By his writings and by his work as a teacher he gave a great impulse to education in Germany. He died in Berlin on May 28, 1793. Büsching was a prolific writer. His *magnum opus* is the unfinished *Neue Erdesbeschreibung* (8th ed. 1787–88), continued by Ebeling. This book, which laid the foundation of modern statistical geography, was published in parts between 1754 and 1761 (Eng. trans. by Murdoch, 6 vols., 1762). Other important works by Büsching are *Grundriss zu einer Historie der Philosophie* (2 parts, 1772–74); and *Beiträge zur Lebensgeschichte denkwürdigen Personen* (6 vols., 1783–89). He also edited two important geographical periodicals.

**BUSENBAUM** (or BUSEMBAUM), **HERMANN** (1600–1668), Jesuit theologian, was born at Nottuln, Westphalia. Out of his lectures to students at Cologne grew his celebrated book *Medulla theologiae moralis, facili ac perspicua methodo resolvens casus conscientiae* (1645). The manual passed through over 200 editions before 1776. Pierre Lacroix added considerably to its bulk, and editions in two folio volumes appeared in both Germany (1710–14) and France (1729). In these sections on murder and especially on regicide were much amplified, and in connection with Damien's attempt on the life of Louis XV. the book was severely handled by the *parlement* of Paris. At Toulouse in 1757, though the offending sections were repudiated by the heads of the Jesuit colleges, the *Medulla* was publicly burned, and the episode undoubtedly led the way to the duc de Choiseul's attack on the Society of Jesus. Busenbaum also wrote a book on the ascetic life, *Lilium inter spinas*. He became rector of the Jesuit college at Hildesheim and then at Münster, where he died on Jan. 31 1668.

**BIBLIOGRAPHY.**—Modern editions of the *Medulla theologiae* (Tournay, 1848 and 1876); another edition with commentary by Ballerini and Palmieri (1893–94).

**BUSH.** (1) A word common to many European languages, meaning (*cf.* the Ger. *Busch*, Fr. *bois*, Ital. *bosco*, and the mediaeval Lat. *boscus*) a shrub or group of shrubs, especially of those plants whose branches grow low and thick. Collectively "the bush" is used in British colonies, particularly in Australasia and South Africa, for the tract of country covered with brushwood not yet cleared for cultivation. From the custom of hanging a bush as a sign outside a tavern comes the proverb "Good wine needs no bush."

(2) From a Teutonic word meaning "a box" (*cf.* the Ger. *Rad-büchse*, a wheel box, and the termination of "blunderbuss" and "arquebus"; the derivation from the Fr. *bouche*, a mouth, is not correct); a lining frequently inserted in the bearings of machinery. When a shaft and the bearing in which it rotates are made of the same metal the two surfaces are in certain cases apt to "seize" and abrade each other. To prevent this, bushes of some dissimilar metal are employed, thus a shaft of mild steel or wrought iron may be made to run in hard cast steel, cast iron, bronze or Babbitt metal. The last, having a low melting point, may be cast about the shaft for which it is to form a bearing.

**BUSHEL**, a dry measure of capacity, containing 8 gallons or 4 pecks (from O.Fr. *boissiel*, cf. med. Lat. *bustellus*, *busellus*, a little box). It has been in use for measuring corn, potatoes, etc., from a very early date, the value varying locally and with the article measured. The "imperial bushel," legally established in Great Britain in 1826, contains 2,218.192 cu.in., or 80lb. of distilled water, determined at 62° F, with the barometer at 30in. Previously, the standard bushel used was known as the "Winchester bushel," so named from the standard being kept in the town hall at Winchester; it contained 2,150.42 cu.in. This standard is the basis of the bushel used in the United States and Canada; but other "bushels" for use in connection with certain commodities have been legalized in different states.

**BUSHIDO**, the unwritten code of laws governing the lives of the nobles of Japan, equivalent to the European chivalry. Its maxims have been orally handed down, together with a vast accumulation of traditional etiquette, the result of centuries of feudalism. Its inception is associated with the uprise of feudal institutions under Yoritomo, the first of the Shoguns, late in the 12th century, but bushido in an undeveloped form existed before them. The word is originally Chinese and was imported into Japan with the rudiments of the "military-knight-deportment" which it represents.

See Inazo Nitobe, *Bushido: The Soul of Japan* (1905); also JAPAN: Army.

**BUSHIRE**, the chief port of Persia, near the head of the Persian gulf (28° 59' N. and 50° 49' E.), is situated on the northern part of a peninsula which nowhere exceeds 40ft. in elevation. Bushire is the headquarters of the Persian administrative division known as "The Gulf Ports," forming part of the province of Fars and Southern Ports, and as such is the residence of the governor of the division and of a director of Persian customs. It is likewise the headquarters of a British consul-general. The population of the town is about 18,000 and of the whole peninsula 25,000; the natives are more Arab in blood than Persian and are occupied mainly in seafaring, trade and, to a lesser extent, agriculture. The town is poorly built but the bazaars are fairly extensive. The ordinary water-supply is not good, being slightly brackish, but a limited supply of drinking water is now obtainable from a condensing-plant erected by the British authorities at Rishire. There is a quarantine-station on the small island of Abbasek on the north side of the inner harbour, but apart from occasional outbreaks of plague the town is comparatively healthy.

Bushire has an outer and an inner anchorage; the former distant about 4½m. from the landing-stage, is open to the winds; but the latter, or so-called harbour of Khor Deira, is a channel from 3½ to 5 cables wide and 3½ fathoms deep, extending for 1½ miles. Being the terminus of an important trade-route to Shiraz, Isfahan and Tehran, 180m. of which (as far as Shiraz) is passable by motor-car in 1½ days, Bushire is a busy place of direct trade with Basra, India, Great Britain, Egypt and various European ports. The articles of export are chiefly opium, woollen carpets, dates and nuts, hides, drugs, gum, raw cotton, wool and cereals. The total trade in 1925-26 amounted to 52,000 tons, valued at about 3½ million sterling of which 44,000 tons were imports. Of 492 vessels calling in that year 329 were British. Vessels of the British India Steam Navigation company's fast mail service between Bombay and Basra call weekly and the ships of other companies occasionally. There are cables to Fao, Hanjam and Jask; a wireless station; and Bushire is the land terminus of the Indo-European telegraph via Tehran.

Bushire has arisen only in comparatively modern times—at the expense of older sites. Its forerunner was Rishire, which had a very ancient history and, even until comparatively modern times, it was a busy maritime town, of 2,000 houses, in the 16th century. Portuguese maps of the 16th and 17th centuries show it as the chief emporium of the Persian coast. But Rishire gradually declined as Bushire arose and became the quarry which supplied the material for the greater part of Bushire. The foundations of the modern town were laid by Nadir Shah who in 1736 destined it to be the base for his Persian navy. Though his scheme came to naught, his interest in the town had the effect of concentrating the

trade of the Persian gulf there, more and more, so that Bandar Abbas lost its commercial supremacy. The British East India company finally transferred their trading activities in Persia from Bandar Abbas to Bushire in 1759 and since then Bushire has become increasingly important.

During the war with Persia (1856-57) Bushire surrendered to a British force and remained in British occupation for some months. Again in Aug. 1915 during the World War the peninsula was again occupied for a short time by British troops.

See G. N. Curzon, *Persia and the Persian Question* (1892); A. T. Wilson, *The Persian Gulf, An Historical Sketch* (1928).

**BUSHMAN LANGUAGES.** The Bushmen of S. Africa (v. S. AFRICA, *General Ethnology*) are divided into many tribal groups, each speaking a different language or dialect, which are all so clearly related that they must be regarded as belonging to the same language family. Owing to certain variations in phonetics, grammatical structure and vocabulary they are now generally classified into three main groups, the Southern, Northern and Central Groups, according to their relative geographical distribution. The Southern Group<sup>1</sup> occurs mainly in the central and western districts of the region roughly S. of the Tropic of Capricorn. It includes the languages of seven tribes, six of which are still in existence, though much broken up, while the seventh is now extinct. Of these tribes, by far the best known, both ethnologically and linguistically, is the *!xam-ka !K'e* (commonly called *Kham*) in the north-west of the Cape Province. The Northern Group is found chiefly in South West Africa and Angola, and includes three large well-known tribes—the *||kau||en* (or *Auen*), the *!Kū* (*Kung*) and the *Hei-!Kum* (*Heikum*)—together with several smaller ones. The Central Group comprises more than a dozen tribes whose territory forms a sort of wedge between the Southern and Northern Groups, and who are met with mainly in the Central and Northern Kalahari desert. The two best known of these are the *Hiechware* (*Masarwa*) of the Tati District of S. Rhodesia and the *Naron* or *laikwe* close to the S.W. border of Bechuanaland Protectorate.

The Hottentot languages are on the whole strongly akin to those of the Bushmen, but at the same time differ from them in certain features which show an affinity with the Hamitic languages. They have therefore generally been looked upon as Hamitic languages which have been greatly modified by Bushman influence. Fundamentally, however, the Hottentot languages have far more in common with the Bushman than with the Hamitic languages, and must accordingly be included in the same language family, of which they constitute a fourth distinct group.<sup>2</sup> Four Hottentot languages have been differentiated: *Nama*, still spoken by the Naman in South West Africa and by their neighbours the Bergdama, a negro people whom they have subjugated; *!Kora*, almost extinct, spoken between the Vaal and Caledon Rivers, and along the Orange River towards Namaqualand; the original *Cape Hottentot*, now quite extinct; and *!Gona* of the Eastern Province of the Cape, also extinct.

**Phonetics**<sup>3</sup>.—Except in the case of *Kung* and *Nama* no detailed studies have been made of the phonetic systems of Bushman or Hottentot languages. Certain characteristic features are readily observable, however. Diphthongs and nasalization of vowels are of frequent occurrence; while all the languages abound in click sounds and ejectives (consonants produced with simultaneous closure of the glottis), as well as in alveolar and velar consonants. In none of them do the labio-dentals *f* and *v* or the semi-vowel *l* occur. The famous "clicks" (*q.v.*) are in reality implosive consonants produced by rarefying the air between

<sup>1</sup>Detailed lists of the Bushman tribes and their distribution are given by Miss D. F. Bleek, "The Distribution of Bushman Languages in S. Africa," in *Festschrift Meinhof* (1927), pp. 55-64; and I. Schapera, "The Tribal Divisions of the Bushmen," *Man*, vol. xxvii. (1927), pp. 68-73.

<sup>2</sup>D. F. Bleek, *Comparative Vocabularies of the Bushman Languages* (ms.); I. Schapera, "The Relationship between the Bushmen and the Hottentots," *S. Afr. Journal of Science*, vol. xxiii. (1926), pp. 85 ff.

<sup>3</sup>C. M. Doke, "The Phonetics of the Language of the *Chū* Bushmen," *Bantu Studies*, vol. II. No. 3 (1925) pp. 129-165; C. Meinhof, *Lehrbuch der Nama-sprache* (1909) pp. 1-44.

some outer closure (or point of tongue articulation) and an inner closure formed either at the velum or the glottis, and then releasing the outer closure so that the air is sucked in. The position of the outer closure varies with the different types of click. Four different positional types of click are used in all the languages—dental, alveolar, palato-alveolar (sometimes called cerebral), and lateral—each of which may be pronounced unvoiced, voiced or nasal, and in various combinations with other consonants. The same four types of click are also found in *Sandawe*, a language spoken in Tanganyika, which has other marked resemblances to the Bushman-Hottentot family (v. *Sandawe*). In the Southern Bushman Group there is further a bilabial unvoiced velaric click, not met with elsewhere, while *Kung* also has a fifth type of click, the retroflex.

The grouping of sounds and the character of the syllable follow the same principles throughout. Syllables generally end in vowels or syllabic nasals, single vowels, diphthongs and nasal clicks alone often forming complete syllables and whole words. Very many syllables commence with a click, and their quick succession in speech is an outstanding feature of all the languages.

In all the languages the variation of the musical pitch of the syllable is also a most important feature. Many words, phonetically alike, but bearing different meanings, are differentiated tonically, the tone distinction being their only distinguishing feature in speech. Five species of tone are employed—high level, mid level, low level, falling and rising.

**Grammatical Processes.**—Grammatical categories and syntactic relationships are expressed in various ways, some common to all the languages, others found in only a few of them. The radical elements of words are to a very large extent monosyllabic, and any additional elements can usually be shown to have a functional significance. All the languages are characterized by the total absence of prefixes and by a paucity of infixes. The chief modification of the actual form of the root itself to express new denotative concepts lies in the employment of suffixes. Active suffixes are employed in all the languages with substantives and verbs, as well as in other parts of speech. In substantives they indicate such concepts as plurality, diminution, sex (in *Nama* and *Naron* only), and negation; while in verbs they denote duration, mood, reflection, reciprocation, etc. It is only in exceptional cases (as in *Kham* and *Hiechware*) that they are used for tense. This extensive use of suffixes is one of the most characteristic features of these languages, and the number of different suffixes and of the uses to which they are put is extremely great.

Reduplication of the root of a word is of frequent occurrence. As an active grammatical process its use is most marked in the Southern Group of languages, especially in *Kham*, where it is the principal means of forming the plural of substantives and is only used with verbs to denote causality or to give them a transitive meaning. In the Northern, Central and Hottentot languages its chief function is to give the verb a causative significance; it is hardly ever used for forming the plural. In all the languages, however, many words occur in a reduplicated form where no apparent significance attaches to the reduplication.

Composition (the uniting into a single word of two different roots) is also common. Its most usual form of occurrence is verb plus verb, the function of the second verbal root being to modify the meaning of the first in some way, usually to indicate some sort of direction.

The extensive use of particles is another characteristic feature. They are used mainly to modify the significance of the verbal root, and two classes may be distinguished, according to their mode of occurrence and function. The verbal root is as a rule unaltered; save when, as already mentioned, suffixes are added to denote duration, mood, reciprocation, etc. Tense, however, is generally denoted by particles which precede the verbal root and which can never be used alone—they always precede the root of the verb and their function always is to indicate tense. Particles of the second class always follow the words whose significance they qualify. Their main function is to indicate direction. As a mechanism particles are frequently employed, and much of the difficulty in translating these languages is created by them.

Word order as a grammatical process is more marked in some languages than in others. In the Southern and Northern Groups, and to some extent in *Hiechware*, where, e.g., there is no formal distinction between substantives and verbs or between cases, word order is of great importance in the structure of the sentence. In *Naron* and *Nama*, where there is such a distinction, the order of words is in no way rigid.

**Grammatical Categories.**—Distinction of sex is formally recognized and expressed only in *Nama* and *Naron*, where there are three grammatical genders, masculine, feminine and common, with different suffix endings. In the other languages, when such a distinction is desired, it is effected by qualifying the substantive with the words for "man" or "woman." In most of the languages there is also a classification of objects according to quality or size, substantives denoting objects which are large, strong, wide, etc., falling into one class, while those denoting small, weak or thin objects fall into another. In *Nama* and *Naron* this distinction is expressed by means of the suffixes indicating gender, the first class taking the masculine, the second the feminine, ending. In the other languages the words for "man" and "woman" respectively are used with the same significance. The principle is the same in both cases, although the mechanism for indicating it differs.

The diminutive is always formed by the addition to the substantive of a special suffix or, in certain languages, of a word meaning "child." Plurality is indicated in all the languages except *Kham* by the use of special suffixes; in *Kham*, suffixes are not unknown, but the most usual process is reduplication. In all the languages two numbers (singular and plural) are recognized; *Nama* and *Naron* are exceptional in having also a dual number. Three classes of persons are recognized in all the languages, but in *Kham* and *Nama* there are both inclusive and exclusive forms of the first person plural, while in *Hiechware* there is a slightly different distinction, an exclusive form being used to denote men only, and an inclusive form to denote both men and women. The other languages have apparently no such differentiation.

The genitive relationship is expressed by opposition, the possessor invariably preceding the possessed; in the Southern Group, in *Naron* and in *Nama* connecting particles are used, elsewhere they are not. The position of the adjective varies—in *Kham* it follows, in Central and Northern Bushman it precedes, the substantive; but it never alters in form to correspond with the number of the substantive it qualifies. In *Nama* two usages are found. In one the adjective, as in the Central and Northern Groups, precedes the substantive and does not alter in form to correspond with it in number or sex. In the other it follows the substantive, and then takes the corresponding endings for number and sex. Demonstrative pronouns and adjectives as a rule precede the substantives they qualify, although in *Nama* the demonstrative adjective may also follow the substantive, in which case it takes the corresponding endings for number and sex.

Tense is formed chiefly by the use of auxiliary particles which precede the verb. The verbal root as a rule is unmodified; but in both *Kham* and *Nama* there are also a few verbal suffixes of tense, while in *Hiechware* there is what appears to be a distinction between incomplete and completed action, indicated by the addition of a suffix to the verb in the latter case. Negation is expressed by the use of a special auxiliary word in all the languages. Direction is indicated in both *Nama* and *Kham* by the compounding of verbal roots, the second element of the compound verb modifying the meaning of the first.

The copula is distinguished from the adjective by word order, which is invariably: substantive, auxiliaries, attribute. The same order of words is found in the relation of subject and predicate. The accusative case is in all the Bushman languages determined chiefly by its position after the verb; in *Nama*, however, there is a special suffix ending for this case. The vocative is expressed by the addition of a suffix to the substantive. The passive voice is not indicated in the Southern and Northern Groups; in *Hiechware* and *Nama* it is formed by the addition of a suffix to the verbal root. Reciprocity is in *Kung* and *Nama* expressed by the use of a special suffix added to the verbal root. Finally, an

important feature in all the languages is that there is never any modification of the verbal root to correspond with the number and person of the subject, *i.e.*, there is no conjugation.

**Numerals.**—The numeral systems vary somewhat. That of the Southern Group is essentially binary in principle. The languages of this group have words for numbers up to three, but are more apt to speak of "two and one" than "three." For anything above three they generally make use of the word "many." But in some cases such formations are found as  $4=2\ 2$ ,  $5=2\ 2\ 1$ , and so on up to 10. In the Northern and Central Groups the same sort of system is found, *e.g.* in *Kung*, but occasionally modifications occur suggestive of a quinary system. Thus in *Naron* the words for "four" mean "two fingers and two fingers," but "five"="hand" (occasionally, however, "2 2 1 fingers"), "six"="one hand and one," "ten"="both hands," "fifteen"="both hands, one foot"; and the same system occurs in *Auen*. In the Hottentot languages, on the other hand, there is a fully developed decimal system, with separate words for the numbers from one to ten, from which all terms for higher number are derived. Thus "twenty"="two tens," "thirty"="three tens" etc., while "one hundred"="large ten," and "one thousand"="full ten."

**Vocabulary.**—The vocabularies of these languages are necessarily very restricted along certain lines. Terms for abstract ideas are rare, and terms are of course lacking to indicate the many things not connected with the mode of life of the people. But in terms dealing with veld lore, wild animals and birds, trees, herbs and roots, the chase and all the wealth of description which that entails, the languages are rich. A comparison of the vocabularies of the different languages shows that they have many words in common, and that even *Nama* shares a very large number of roots with one or other of the Bushman languages. Its greatest resemblances are with *Naron* and *Hiechware*, but many of its words occur in other Bushman languages also, sometimes in one, sometimes in another, even in the language spoken by the Lake Chrissie Bushmen of the Eastern Transvaal. There are many words in *Nama* which cannot be found in any of the other languages, just as there are words in *Kung* or *Kham* which are peculiar to these languages. Frequently synonyms are found in *Nama* of which one word is also found in the Bushman languages, while another is not. If the languages are arranged according to similarity of roots the Central Group shows most affinity with *Nama*, the Northern Group has less resemblance and the Southern Group still less. There is, however, no sharp division. The languages of the *Kakia Masarwa* and the *[nu]e:n* both of which belong to the Southern Group, have more in common with the Northern Group than has *Kham*, and *Hiechware* is a definite link between the Northern Group and *Naron*, which again is a step nearer *Nama*.

Bleek and L. C. Lloyd, *Specimens of Bushman Folklore* (1911; invaluable collection of *Kham* texts); S. S. Dornan, "The Tati Bushmen (Masarwas) and their Language," *J. Roy. Anthr. Inst.*, vol. xlvii. (1917) pp. 37-112 (*Hiechware* grammar and vocabulary); H. Vedder, "Grammatik der Buschmansprache der 'Ku-Buschmänner,'" *Zeits. f. Kol-Spr.*, vol. i. (1910), pp. 5-24, 106-117; K. Meinhof, *Lehrbuch der Nama-Sprache* (1909; standard work, bibl.); W. Planert, "Die Schnalzsprachen," *Bibliotheca Africana*, vol. ii. (1927) pp. 296-315 (recent bibl.). See also works of D. F. Bleek and I. Schapera referred to in the footnotes. (I. S.)

**BUSH MASTER** (*Lachesis mutus*), one of the largest members of the rattlesnake family, reaching a length of 8ft. It inhabits the Amazon region and is extremely venomous, with very large fangs. The tail terminates in a spine which makes a rustling sound as the snake moves. The bush master and the diamond-back rattlesnake of the southern United States are the largest American poisonous snakes.

See C. Darwin, *Voyage of the Beagle* (1845); H. W. Bates, *A Naturalist on the River Amazons* (1884); E. G. Boulenger, *Reptiles and Batrachians* (1914).

**BUSHMEN.** The Kalahari desert and northern neighbourhood (south-west Africa) are the present habitats of nomad hunters and food gatherers, the Khuai or San groups known as Bush-

men. The average height of the men of the southern, central and western groups is about 5ft. but in the North and East where inter-marriage and admixture with Bantu-speaking peoples have occurred, men are found occasionally of 6ft. height. The skin is yellow to olive. Steatopygia (*q.v.*) is common among the women, the head is small and flat, while the nose is very broad, the cheekbones are prominent and the forehead bulging. The hair is short, rolled up into small knots and distributed like peppercorns. The ears frequently have no lobe and the eyes are narrow and often slightly oblique.

**Social Organization.**—The family consists of a man and his wife or wives and their dependent children. The unit is the small hunting band (patrilineal), within which marriage is forbidden. In some cases marriage is matrilineal until a child is born when the wife and husband join his patrilineal group. There are no chiefs but social matters are managed by the elders.

**Religion.**—The moon is worshipped and as the hunting group breaks up into family groups during the dry season, the main religious rites fall within the rainy season when the families mass together and form the group, each group having definite territories. In Bushmen folk lore the praying mantis plays a large part.

The Bushman formerly extended over the greater part of South Africa and evidence is accumulating to show that in the north and east of Africa Bushman peoples once existed.

See G. M. Theal, *The Yellow and Dark-skinned People of South Africa* (1910); also S. AFRICA: *Ethnology and Bibliography*.

**BUSHNELL, HORACE** (1802-76), American theologian, was born in the village of Bantam, township of Litchfield, Conn., April 14, 1802. He graduated at Yale in 1827, was associate editor of the *New York Journal of Commerce* in 1828-29, and in 1829 became a tutor at Yale. Here he at first took up the study of law, but in 1831 entered the theological department of Yale college, and in 1833 was ordained pastor of the North Congregational church in Hartford, Conn., where he remained until 1859, when on account of long-continued ill-health he resigned his pastorate. Thereafter he had no settled charge, but, until his death at Hartford, Feb. 17, 1876, he preached occasionally and was diligently employed as an author. While in California in 1856, for the restoration of his health, he took an active interest in the organization, at Oakland, of the College of California (chartered in 1855 and merged in the University of California in 1869), the presidency of which he declined. As a preacher, Dr. Bushnell was a man of remarkable power. Not a dramatic orator, he was in high degree original, thoughtful and impressive in the pulpit. Four of his books were of particular importance: *Christian Nurture* (1847), in which he opposed revivalism and "effectively turned the current of Christian thought toward the young"; *Nature and the Supernatural* (1858), in which he discussed miracles and endeavoured to "lift the natural into the supernatural" by emphasizing the supernaturalness of man; *The Vicarious Sacrifice* (1866), in which he contended for what has come to be known as the "moral view" of the atonement in distinction from the "governmental" and the "penal" or "satisfaction" theories; and *God in Christ* (1849), in which he expressed, it was charged, heretical views as to the Trinity, holding, among other things, that the Godhead is "instrumentally three—three simply as related to our finite apprehension, and the communication of God's incommunicable nature." Attempts were made to bring him to trial, but they were unsuccessful, and in 1852 his church unanimously withdrew from the local "consociation," thus removing any possibility of further action against him. To his critics Bushnell formally replied by writing *Christ in Theology* (1851), in which he employed the important argument that spiritual facts can be expressed only in approximate and poetical language, and concluded that an adequate dogmatic theology cannot exist. That he did not deny the divinity of Christ he proved in *The Character of Jesus, Forbidding His Possible Classification with Men* (1861). He also published *Sermons for the New Life* (1858); *Christ and His Salvation* (1864); *Work and Play* (1864); *Moral Uses of Dark Things* (1868); *Women's Suffrage, the Reform against Nature* (1869); *Sermons on Living Subjects* (1872) and *Forgiveness and Law* (1874). Dr. Bushnell

was greatly interested in Hartford, and was the chief agent in procuring the establishment of the public park named in his honour by that city.

An edition of Dr. Bushnell's works, in eleven volumes, appeared in 1876-81; and a further volume, gathered from his unpublished papers, as *The Spirit in Man: Sermons and Selections*, in 1903. New editions of his *Nature and Supernatural, Sermons for the New Life, and Work and Play*, were published the same year. See Mrs. M. B. Cheney's *Life and Letters of Horace Bushnell* (1880; new edition, 1903); Dr. Theodore T. Munger's *Horace Bushnell, Preacher and Theologian* (1899), and a series of papers in the *Minutes of the General Association of Connecticut* (Hartford, 1902). A full bibliography, by Henry Barrett Learned, is appended to Dr. Bushnell's *Spirit in Man*.

**BUSHRANGERS**, the name given to the Australian brigands (at first escaped convicts) who, in the early 19th century, took refuge in the "bush" and, supporting themselves by plunder, terrorized the scattered inhabitants. Their activities were checked by the Bushranging Act, passed in New South Wales in 1830 (renewed 1834). Later the gold discoveries made highway robbery a profitable enterprise, and a recrudescence of bushranging took place in the middle of the century; nor was it finally stamped out till the annihilation of the Kelly gang in 1870. (See KELLY, EDWARD.)

See F. A. Hare, *The Last of the Bushrangers* (1892); G. E. Boxall, *Australian Bushrangers* (3rd ed., 1908).

**BUSH-WREN**, the name given to a family of birds (Xenicidae) confined to the highland forests of New Zealand. There are five species of these tiny, wren-like forms, placed in three genera (*Xenicus*, *Acanthidiositta* and *Traversia*).

**BUSINESS CODES**, a term applied to principles or standards of fair and ethical practice agreed upon by particular groups engaged in the sale or exchange of goods or services. The business world, especially in America, because of its rapid extension, has, since about 1910, given them increasing attention; and this is in keeping with the history of commercial law, for the voluntary group adoption of trade codes has always arisen from changing mercantile conditions, and has preceded the more formal crystallization into law of principles of equitable dealing. Thus the old law merchant, antedating and embodying a very important part of common law governing mercantile transactions, arose during the great European fairs held of the middle ages, which were attended by merchants from many countries. The city laws were temporarily suspended and a special universal code called "law merchant" used, which, during succeeding centuries, crystallized into modern mercantile law comprising negotiable instruments, partnership, trademarks, etc.

**Development.**—A similar evolution is now going on apace, particularly in America, where the conditions have given rise to similar situations that led up to the formation, during the fair days, of the code law merchant, namely, (1) inadequacy of existing law, (2) confusion and misunderstanding, (3) impediment to quick and fair trading, (4) abuse and dishonesty, (5) outcry and protest, (6) banding together of honest merchants for protection, (7) crude codification of the general consensus of opinion and fair practice, (8) efforts at enforcement, (9) refinement and general acceptance of code, (10) crystallization into law. American and English courts have always recognized that merchants' customs or codes—if they were nearly universally known and long established, and if transactions were made with knowledge of their existence—were an integral part of law merchant, which is now itself a part of common law, with all the force of law behind it; hence the increasing activity in setting up codes in America is significant, for it presages a modernization of mercantile law and custom to fit our "machine age" and large-scale commerce. It is adapting commercial ethics and practice to present-day needs, hastening emergence from pioneering chaos, and achieving in the United States a socialization of the sharp individualism which was inevitable in a period of extremely rapid advance.

**Self-government.**—Somewhat like law merchant, the first stage of present day *business codes* has been styled "self-government" or "self-discipline" in business, and is administered by business itself. In this stage the professions are the first to set up, through their associations, codes of itemized practice standards, using group pressure and moral suasion upon their members to

observe them, the finest example being the code formulated by the American Medical Association. This is possibly the oldest (dating back to the "oath of Hippocrates") and most meticulous of group codes, self-imposed and self-policed. Professional bodies in other countries also have their own codes.

**Federal Trade Commission.**—The entire American business world has shared the professional spirit, because of the "functionalizing" of modern large-scale business. The modern business manager is not so much a "steel" man, for example, as a member of the profession of purchasing agents, advertising managers, office managers, production managers, etc., happening to be working in the steel field. His loyalty is not so much to the *industry* as to his *function*, and he therefore acquires the ethics of his functional profession, placing himself under the influence and surveillance of its group pressure. Prior to this professionalizing, the purchasing agent, for example, had no specialized ethical guidance from a guild code, and in consequence, decades ago, purchasing in America was honeycombed with subtle graft, within the law and often even within the custom of the industry, which had habituated itself to expensive "presents," treats and trips for purchasing agents. In the same way advertising managers, as a body, have codes for the elimination of fraudulent, misleading and irresponsible statements in advertising, and credit managers set up codes to eliminate fraudulent bankruptcies, fire sales and other credit evils. There followed in natural sequence an interest in codes for organized lines of commerce and industry, associations of manufacturers and owners or chief company executives. These, being competitors, and not having the special personal pride of profession or craft fellowship for stimulation, naturally encountered more difficulty in agreeing upon codes. After 1920, however, they were very active, and advanced the code principle to fit their own needs. The codes of the professions are essentially personal, and do not involve the intricate mercantile relationships which face the owners and executives of commercial and industrial undertakings. As a result it has been these organized owners and executives of American commerce and industry who have brought the code principle to its second stage of development, namely more definite and detailed codification and more authoritative crystallization into some semblance of law. This has been accomplished by means not only of more and better business laws and law enforcement, but also by means of the U.S. Federal trade commission, through "trade practice conferences" and trade "stipulations." An entire industry, grocery, for instance, is officially invited by the commission—at the suggestion of its leaders to agree upon and draft codes and standards of fair trade practice. These are debated, and finally codified as representing what might be termed the special "law merchant" of that trade or industry. The distinctive differences between this second stage, involving the Federal trade commission and the first stage, involving only voluntary trade organizations are—(1) that trade organizations reach only those who choose to become members, and—unless observance of the code is made a condition of membership, and facilities for policing, trial, expulsion and threat to trade prestige are provided—it is not strictly enforceable even upon members, and tends to degenerate into mere idealistic sentiment; (2) the second stage, aided by participation of the Federal trade commission reaches the entire industry, and places behind the code, as affirmed before the commission or in up-to-date laws and vigilant enforcement thereof, first the moral power of the Government, and second, its legal power through the "cease and desist" orders of the commission and its "stipulations." Based on the authoritative "customs of the merchants" as detailed in the fair codes voluntarily agreed upon, the U.S. Government undertakes thus in some degree to enforce the special self-codified law merchant of various trades and industries. Codes in this way gradually become law.

The task of policing the business world for code-transgression is a huge one, especially in America, a young country, where an invaluable national agency is the *Better Business Bureau*, which has branches in many cities. The latter sprang from the "vigilance committees" of the advertising profession, and do a great service in holding doubtful and erring traders to the accepted codes of fair trading.

**The Commercial Standards Council**, a loose American federation of over a hundred national trade and functional organizations, has aimed at the achievement of the third stage in the upward evolution of trade codes chiefly by (1) seeking to amalgamate with the national and State laws certain particularly basic trade codes, such as an effective anti-commercial bribery law; (2) securing wider general understanding and observance of high standards of business practice in details which are still abused or confused, and on which codes are in process of formation. The particular need for such a general organization is evident from the fact that individual branches of trade and industry, as well as the functional professions, tend strongly in their codes toward self-interest; the broader aspects of general business well-being and the general public good are frequently slurred. Trade codes, therefore, tend to be lightly valued, whereas they might be—and often are—the vital raw material in the processes of growth; they are, of course, meaningless if permitted to be vaguely general, perfunctory, selfishly narrow or to settle into rigid creed; they need constant sifting, change, watching and enforcing and crystallization into law.

The American method of written codes is spreading in European and other countries through the International Rotary club movement (one of the pioneers in code development in America) and the International Advertising Association (composed of clubs all over the world), which later also pioneered for trade codes in America. In Europe many of the trade abuses which American codes aim to correct—commercial bribery, for instance—either do not arise or are covered by law. China has perhaps the most highly developed form of the unwritten trade code, and as her central government has seldom been strong, trade morality has naturally been left to her ancient and powerful guilds.

**Business Ethics.**—One of the objects of business codes is the improvement of facilities for quick trading. The increasing concentration of the mercantile world, and of competition with the accompanying low ratio of profit per transaction, has made speed of trading, turnover and standardization matters of vital importance, though, owing to the natural instability of values the necessity for quick trading long ago made itself manifest in the stock markets and perishable commodity exchanges. In the wheat pits, when a man raises his hand and in a second concludes the purchase of a million dollars' worth of wheat, the factors in the transaction are protected by trade code from start to finish. The trader has passed no money and made no expensive examination of the wheat; it will be up to the grade set; its condition will be correct; its disposition safe, the order authentic, the time of delivery understood and the money in the bank to pay for it; the broker's word is sufficient. The same principles hold good in the London, Paris or New York stock exchange, and other exchanges throughout the world. Three to four million shares of stock change hands almost daily on the New York Stock Exchange within five hours, a feat that without the strictly enforced and detailed brokers' code would be impossible. Anyone who breaks this code is "found guilty of conduct inconsistent with just and equitable principles of trade" and is completely ostracized. All business ethics are time-saving devices, and all true trade codes are efforts to reduce friction and speed up business; thus, selling by telephone to known customers is increasing because the trend in business to-day is to have full confidence in the code of the man at the other end.

The following are selections of items from various codes, illustrative of the code method:

#### *Examples from Professional Codes*

**Physicians** (Ethics, Chap. II., Art. IV., Sec. 4): "When a physician does succeed another physician in the charge of a case, he should not make comments on or insinuations regarding the practice of the one who preceded him. Such comments or insinuations tend to lower the esteem of the patient for the medical profession and so react against the critic."

**Accountants** (Rules, Sec. 10): "No member or associate shall render or offer to render professional service, the fee for which shall be contingent upon his findings and the results thereof."

**Retailers** (Code, Sec. 10): "We pledge ourselves to the use of 'special reductions,' 'specially priced' and similar terms, only when merchandise is being offered at a price, less than the regular or prevailing price in our store."

**Credit Managers** (Canons, No. 7): "It is always improper for one occupying a fiduciary position to make a secret personal profit therefrom. A member of a creditor's committee, for example, may not, without freely disclosing the fact, receive any compensation for his services, for such practices lead to secret preferences and tend to destroy the confidence of business men in each other. 'No man can serve two masters.'"

**Advertising Managers** (Declaration A.N.A.): "Resolved that we, members of the Association of National Advertisers are opposed to advertising of the following kinds: All advertising that is fraudulent or questionable, whether financial, medical or any other; all advertising that is indecent, vulgar or suggestive either in theme or treatment; that is "blind" or ambiguous in wording and calculated to mislead; that makes false, unwarranted or exaggerated claims; that makes uncalled-for reflections on competitors or competitive goods; that makes misleading "free" offers; all advertising to laymen of products containing habit-forming or dangerous drugs; all advertising that makes remedial, relief or curative claims, either directly or by inference, that are not justified by the facts or common experience; and any other advertising that may cause money loss to the reader or injury in health or morals or loss of confidence in reputable advertising and honorable business."

**Journalism** (Canons, American Society of Newspaper Editors, Sec. VI, Item 1): "A newspaper should not invade private rights or feelings without sure warrant or public right as distinguished from public curiosity."

#### *Examples from Industry and Trade Codes*

**Plumbing Supplies** (Code, Sec. II., Par. 4): "It is unethical to cancel an order placed and accepted in good faith."

**Metal Lath** (Code, Manufacturer, Sec. 2): "All bundles of lath shall be identified with a tag giving the weight of the lath per square yard and the kind of metal."

**Restaurants** (Code, Sec. II., Item 11): "It is thoroughly ethical to decline to accept goods delayed in delivery beyond the time specified, provided that acceptance would cause loss to the purchaser. It is unethical to decline goods on delayed delivery if no loss has resulted from such delay." (J. G. F.)

**BUSINESS MAN'S INVESTMENT**, a United States phrase describing stocks or bonds of companies which do not meet the requirements of "legal investments" or the "gilt edge" class, but which are comparatively sound and will ordinarily prove safe and profitable to the business man who understands how to keep in touch with business conditions and foresees the effect of such upon his holdings.

**BUSINESS ORGANIZATION:** see OFFICE MANAGEMENT; SCIENTIFIC MANAGEMENT.

**BŪSIRĪ** (Abū 'Abdallāh Muhammad ibn Sa'īd ul-Būsirī) (1211-1294), Arabian poet, lived in Egypt, where he wrote under the patronage of Ibn Hinnā, the vizier. His poems seem to have been wholly on religious subjects. The most famous of these is the so-called "Poem of the Mantle." It is entirely in praise of Mohammed, who cured the poet of paralysis by appearing to him in a dream and wrapping him in a mantle. Even in the poet's lifetime it was regarded as sacred. Its verses are used as amulets; it is employed in the lamentations for the dead; it has been frequently edited and made the basis for other poems, and new poems have been made by interpolating four or six lines after each line of the original. It has been published with English translation by Faizullahbhai (Bombay, 1893), with French translation by R. Basset (1894), with German translation by C. A. Rafis (1860), and in other languages elsewhere.

For commentaries, etc. cf. C. Brockelmann's *Gesch. der Arab. Literatur* (Weimar, 1898), vol. i. pp. 264-267.

**BUSIRIS**, in a Greek legend preserved in a fragment of Pherecydes, an Egyptian king, son of Poseidon and Lyssianassa. After Egypt had been afflicted for nine years with famine, Phrasius, a seer of Cyprus, arrived in Egypt and announced that the cessation of the famine would not take place until a foreigner was yearly sacrificed to Zeus or Jupiter. Busiris commenced by sacrificing the prophet, and continued the custom by offering a foreigner on the altar of the god. It is here that Busiris enters into the circle of the myths and *parerga* of Heracles, who had arrived in Egypt from Libya, and was seized and bound ready to be killed and offered at the altar of Zeus in Memphis. Heracles burst the bonds which bound him, and, seizing his club, slew Busiris with his son Amphidamas and his herald Chalbes. This exploit is often represented on vase paintings from the 6th century B.C. and onwards, and the legend is referred to by Herodotus and later writers. Although some of the Greek writers made

Busiris an Egyptian king and a successor of Menes, about the 60th of the series, and the builder of Thebes, those better informed by the Egyptians rejected him altogether. Various esoteric explanations were given of the myth, and the name not found as a king was recognized as that of the tomb of Osiris. Busiris is here probably an earlier and less accurate Graecism than Osiris for the name of the Egyptian god Usiri. All shrines of Osiris were called *P-usiri* (Busiris), but the principal city of the name was in the centre of the Delta, capital of the 9th (Busirite) nome of Lower Egypt. The name Busiris in the legend may have been caught up merely at random by the early Greeks, or they may have vaguely connected their legend with the Egyptian myth of the slaying of Osiris (as king of Egypt) by his mighty brother Seth, who was in certain aspects a patron of foreigners. Phrasius, Chabes and Epaphus (for the grandfather of Busiris) are all explicable as Graecized Egyptian names, but other names in the legend are purely Greek. The sacrifice of foreign prisoners before a god, a regular scene on temple walls, is perhaps only symbolical for the later days of Egyptian history, but foreign intruders must often have suffered harsh treatment at the hands of the Egyptians, in spite of the generally mild character of the latter.

See H. v. Gartringen, in Pauly-Wissowa, *Realencyklopädie*, for the evidence from the side of classical archaeology. (F. L. G.)

**BUSK, GEORGE** (1807–1886), British surgeon, zoologist and palaeontologist, son of Robert Busk, merchant of St. Petersburg (Leningrad), was born in that city on Aug. 12 1807. He studied surgery in London, at both St. Thomas's and St. Bartholomew's hospitals, was appointed assistant-surgeon to the Greenwich hospital in 1832, and served as naval surgeon first in the "Grampus," and afterwards for many years in the "Dreadnought." In 1855 he retired and settled in London, where he devoted himself mainly to the study of zoology and palaeontology. As early as 1842 he had assisted in editing the *Microscopical Journal*; later he edited the *Quarterly Journal of Microscopical Science* (1853–68) and the *Natural History Review* (1861–65). From 1856 to 1859 he was Hunterian professor of comparative anatomy and physiology in the Royal College of Surgeons, and he became president of the college in 1871. He became the leading authority on the Polyzoa; and later the vertebrate remains from caverns and river-deposits occupied him. He died in London on Aug. 10 1886.

**BUSKEN-HUET, CONRAD** (1826–1886), Dutch literary critic, was born at The Hague. After studying at Geneva and Lausanne, he was appointed pastor of the Walloon chapel in Haarlem in 1851. In 1863 he resigned on grounds of conscience, and in 1868 went out to Java as editor of a newspaper. In 1872 he published the first series of his *Literary Fantasies*, a title under which he gradually gathered in successive volumes all that was most durable in his work as a critic. His one novel, *Lidewijde*, was written under strong French influences. Busken-Huet spent his later years in Paris, where he died. For the last quarter of a century he had been the acknowledged dictator in all questions of Dutch literary taste. Perfectly honest, desirous to be sympathetic, widely read, and devoid of all sectarian obstinacy, Busken-Huet introduced into Holland the light and air of Europe. He was a brilliant writer, who would have been admired in any language, but whose appearance in a literature so stiff and dead as that of Holland in the 'fifties was dazzling.

**BUSKIN**, a word of uncertain origin, existing in many European languages [Fr. *brousequin*, Ital. *borzacchino*, etc.]. A half-boot or high shoe strapped under the ankle, and protecting the shins; the thick-soled boot or *cothurnus* in the ancient Athenian tragedy, used to increase the stature of the actors, as opposed to the *soccus*, "sock," the light shoe of comedy. The term is thus often used figuratively of a tragic style.

**BUSLAEV, FEDOR IVANOVICH** (1818–1898), Russian author and philologist, was born on April 13 1818, at Krensk, the son of a government official. After a period of travel abroad he became assistant professor, and in 1881 professor, of Russian literature in Moscow. His works on the historical grammar of the Russian language are among the earliest important contributions to the subject. He maintained that the Slavonic languages had been subject to Christian influences long before

the time of Cyril and Methodius. See S. D. Sheremetev, *Memoir of F. I. Buslaev* (1899).

**BUSONI, FERRUCCIO** (1866–1924), Italian pianist and composer, was born at Empoli, near Florence. After studying in Vienna and at Graz, he became a member of the Accademia Filarmonica of Bologna. In 1888 he was appointed professor at Helzingfors, and in 1890 became professor at the Moscow Conservatoire. His concerts in different countries brought him world-wide fame as a virtuoso. In 1913 he became director of the Liceo Musicale at Bologna, and in 1920 of the Meisterklasse for composition in Berlin, where he died. As a pianist Busoni possessed a superb mastery over the keyboard, probably unequalled since the time of Liszt, together with a great sense of beauty. His compositions include an opera, *Brautwahl* (1913), chamber music, orchestral works, piano solos and songs. His brilliant and scholarly arrangements, notably of Bach's "well-tempered clavier," have been invaluable to pianists; while his talent as a writer is shown in his essays, which include *Entwurf einer Neuen Ästhetik der Tonkunst* (1916).

**BIBLIOGRAPHY.**—See H. Leichtentritt, *F. Busoni* (1916), and G. Seldon-Goth, *F. Busoni* (1922).

**BUSS, FRANCES MARY** (1827–1894), English schoolmistress, was born in London, the daughter of the painter-etcher R. W. Buss, one of the original illustrators of *Pickwick*. She was educated at a school in Camden Town, and continued there as a teacher, but soon joined her mother in keeping a school in Kentish Town. In 1848 she was one of the original attendants at lectures at the new Queen's College for Ladies. In 1850 her school was moved to Camden street, and under its new name of the North London Collegiate School for Ladies it rapidly increased in numbers and reputation. In 1864 Miss Buss gave evidence before the Schools Inquiry Commission, and in its report her school was singled out for exceptional commendation. Indeed, under her influence, what was then pioneer work of the highest importance had been done to put the education of girls on a proper intellectual footing. Shortly afterwards the Brewers' Company and the Clothworkers' Company provided funds by which the existing North London Collegiate School was rehoused and a Camden School for Girls founded, and both were endowed under a new scheme, Miss Buss continuing to be principal of the former. She played an active part in promoting the success of the Girls' Public Day School Trust, encouraging the connection of the girls' school with the university standard by examinations, working for the establishment of women's colleges, and improving the training of teachers; and her energetic personality was a potent force among her pupils and colleagues. She died in London on Dec. 24, 1894.

**BUSSA**, a town of Borgu, Northern Nigeria, on the west bank of the Niger, in 10° 9' N., 4° 40' E. It is situated just above the rapids which mark the limit of navigability of the Niger by steamer from the sea. Here in 1806 Mungo Park, in his second expedition to trace the course of the Niger, was attacked by the inhabitants and drowned while endeavouring to escape. During 1894–98 its possession was disputed by Great Britain and France, the last-named country acknowledging by the convention of June 1898 the British claim, which carried with it the control of the lower Niger. In 1925 a new town was laid out on a more sanitary site, and the old town gradually deserted. (See **BORGU**.)

**BUSSACO, SERRA DE**, a mountain range on the frontiers of the Aveiro, Coimbra and Vizeu districts of Portugal. The highest point is the Ponta de Bussaco (1,795ft.), with a magnificent view over the Serra da Estrela, the Mondego valley and the Atlantic ocean. Luso (pop. 1,870), a village celebrated for its hot mineral springs, is the nearest railway station. Bussaco's hotel, built in the Manueline style, encloses the buildings of a secularized Trappist monastery, founded in 1268. The convent woods have long been famous for their cypress, plane, evergreen, oak, cork and other ancient forest trees. A bull of Pope Gregory XV. (1623), anathematizing trespassers and forbidding women to approach, is inscribed on a tablet at the main entrance; another bull, of Urban VIII. (1643), threatens with excommunication any person harming the trees. In 1873 a monument was erected on the southern slopes of the Serra to commemorate the battle of Bus-

saco in which the French, under Marshal Masséna, were defeated by the British and Portuguese, under Lord Wellington, on Sept. 27, 1810.

**BUSSACO, BATTLE OF.** Compelled by circumstances (see PENINSULAR WAR) to adopt a defensive policy in 1810, Wellington had spent the winter in creating the "lines of Torres Vedras" (q.v.). Before retiring behind them, however, he decided that, for the sake of the *moral* of the newly-formed Portuguese army, as well as of the Government at home, it was desirable to fight one defensive battle under the most favourable conditions. By a process of elimination he had concluded that the French invasion of Portugal, which he knew to be imminent, must follow the line of the river Mondego. He therefore disposed his army, consisting of 26,000 British and 25,000 Portuguese, along the Bussaco ridge, astride the Vizeu-Mealhada road which Masséna, the French commander, was following. This ridge, 10 m. in length and about 1,500 ft. high, ran from the Mondego on the south to the almost impassable Sierra de Caramullo in the north. Crossed by only three roads, it was itself so steep and rugged as to constitute a formidable natural obstacle. Wellington now crowned it with guns and soldiers; Hill's division, recalled at the last moment from watching the Tagus, held the extreme right; next to him Leith covered the road from San Paulo; Picton that from San Antonio; whilst the main Vizeu-Mealhada road was watched by Spencer on its south side and Craufurd on its north; on the extreme left, just below the slopes of the Sierra de Caramullo, lay Cole. Portuguese brigades were interspersed among the British units, and the walled convent of Bussaco on the main road was garrisoned by Pack's Portuguese brigade. Wellington was confident that any attempt to assault the position must fail, but there was one road over the Sierra de Caramullo to Sardao by which it might be turned; this road he ordered Trant, with a force of Portuguese irregulars, to block. Masséna, however, "the spoilt child of victory," was contemptuous of opposition; he considered the Portuguese troops to be valueless, and believed, too, that Hill was still 70 m. away at Abrantes. After a very inadequate reconnaissance, therefore, he ordered a frontal attack. Reynier's corps, on the left, was to advance on to the ridge by the San Antonio road, and having gained the summit, to sweep northward along its crest. Contingent upon this success, Ney's corps was to advance up the main Vizeu-Mealhada road, whilst Junot was to remain in reserve in rear of Ney. The whole French force numbered some 80,000 men. In the early morning of Sept. 27, Reynier advanced, having Merle's division in column on the right, Heudelet's on the left, with Foy in reserve. So arduous was the climb that when they reached the crest the French troops were utterly exhausted; they were struck by a storm of grape in front, by musketry on each flank; finally, a vigorous bayonet charge swept Merle's column headlong down the hill, while Heudelet's fell back in scarcely better order. Reynier now ordered Foy to try where Merle and Heudelet had failed, but Wellington had by this time ordered up Leith and Hill from the right, and Foy's column in its turn was driven off with heavy loss. In spite of Reynier's failure Ney advanced to the attack, having Loisson's division on the right of the main road, Marchand's on the left. Once again the superiority of British tactics was apparent; the overlapping fire of Craufurd's line withered the head and flanks of the solid French column, which could make no adequate reply. It needed but a vigorous bayonet charge to hurl Loisson's men down the hill. Marchand, meanwhile, had made no headway against Pack's Portuguese and, seeing Loisson's fate, withdrew. Though he still had Junot in reserve, Masséna realized that a frontal assault against such a position and such soldiers could not succeed. He therefore broke off the battle, having lost 5,000 men, against an Allied loss of barely 1,300. Wellington's object, moreover, had been fully achieved; the Portuguese had seen their redoubtable enemies wither before their fire, melt away before their charge. The following day Masséna found his way through the Caramullos, Trant having been too late to block the pass; but Wellington had already begun his retreat, which took him safely behind the impregnable lines of Torres Vedras.

**BUSSY, ROGER DE RABUTIN, COMTE DE** (1618-1693), known as BUSSY-RABUTIN, French writer, was born on April 13, 1618, at Epiry, near Autun. His father, Léonor de Rabutin, was lieutenant-general of the province of Nivernais. Roger entered the army when he was only 16 and fought through several campaigns, succeeding his father in the office of *mestre de camp*. In 1641 he was sent to the Bastille by Richelieu for some months as a punishment for neglect of his duties in his pursuit of gallantry. In 1645 he succeeded to his father's position in the Nivernais and served under Condé in Catalonia. He had married in 1643, but his wife died in 1646, and he became notorious by an attempt to abduct Madame de Miramion, a rich widow. This affair was settled by a considerable payment, and he afterwards married Louise de Rouville. When Condé joined the party of the Fronde, Bussy joined him, but a fancied slight on the part of the prince finally decided him for the royal side. He fought both in the civil war and under Turenne in Flanders. He distinguished himself at the battle of the Dunes and elsewhere; but his quarrelsome disposition, his overweening vanity, and his habit of composing libellous *chansons* made him eventually the enemy of most persons of position both in the army and at court. In the year 1659 he fell into disgrace for having taken part in an orgy at Roissy near Paris during Holy Week. Bussy was ordered to retire to his estates, and beguiled his enforced leisure by composing, for the amusement of his mistress, Madame de Montglas, his famous *Histoire amoureuse des Gaules*. This book, a series of witty but ill-natured sketches of the intrigues of the chief ladies of the court, circulated freely in ms., and had many spurious sequels. It was said that Bussy had not spared the reputation of Madame, and the king, angry at the report, was not appeased when Bussy sent him a copy of the book to disprove the scandal. He was sent to the Bastille on April 17, 1665, and a year later he was liberated on condition of retiring to his estates, where he lived in exile for 17 years.

The *Histoire amoureuse* is in its most striking passages adapted from Petronius, and, except in a few portraits, its attractions are chiefly those of the scandalous chronicle. But his *Mémoires*, published after his death, are extremely lively and characteristic and have all the charm of a historical romance of the adventurous type. His voluminous correspondence yields in variety and interest to few collections of the kind, except that of Madame de Sévigné, who was his cousin, and whose letters first appeared in it.

The best edition of the *Histoire amoureuse des Gaules* is that of Paul Boiteau in the *Bibliothèque Elzévirienne* (1856-59). The *Mémoires* (1857) and *Correspondance* (1858-59) were edited by Ludovic Lalanne. Bussy wrote other things, of which the most important, his *Genealogy of the Rabutin Family*, remained in ms. till 1867, while his *Considérations sur la guerre* was first published in Dresden in 1746. He also wrote, for the use of his children, a series of biographies, in which his own life serves a moral purpose.

**BUSTAMANTE, ANTONIO SÁNCHEZ DE** (1865- ), Cuban lawyer, statesman, publicist, was born on April 13, 1865, in Havana, Cuba, where his father was professor and dean of the faculty of medicine in the university. He received most of his education in his native city, and obtained his degree of advocate at the university there. In 1884, before he was yet 20, he won by public competitive examination the chair of International Law in the university, which he continues to hold. In 1902, when the Republic of Cuba was constituted, he was elected senator for the province of Pinar del Rio, and was re-elected in 1909 to represent Havana. In 1895 he was made member of the Institute of International Law, the only Cuban who has gained that honour, and in 1907 he was selected as Delegate Plenipotentiary of Cuba to the Second Peace Conference at The Hague. He is dean of the Havana Bar; member of the Permanent Arbitration Tribunal of The Hague; Custodian of Alien Enemy Property, 1918. In 1928 he was chosen president of the 6th Pan-American Congress, held at Havana. He is the author of numerous works pertaining to international law. Among them are: *Tratado de Derecho Internacional Privado* (Havana, 1896); *Programa de las Asignaturas de Derecho Internacional Público y Derecho Internacional Privado* (Madrid, 1891); *El Orden Público, Estudio de Derecho Internacional Privado* (Havana, 1893); *Le Canal de Panama et le*

*Droit International* (Bruxelles, 1895); *La Segunda Conferencia de la Paz* (Madrid, 1908); *La Autarquia Personal*, a study of International Private Law. (W. B. P.)

**BUSTARD**, a bird (*Otis tarda*), now extinct in Britain, but inhabiting other parts of Europe, Asia as far east as Mesopotamia; and also Morocco. It lives in open uncultivated country, feeding on plants, worms and small animals. It grows to a length of 4 ft., with an expanse of wing of 8 ft., and may weigh 32 lb. A wary bird, its flight is powerful and sustained. The bustard is migratory in most parts of its range, and is probably polygamous. In courting, the head is bent back so as almost to touch the uplifted tail, the throat-pouch inflated and the white secondary feathers exposed. (See *COURTSHIP OF ANIMALS*.) A more southern species is the little bustard (*O. tetrax*), a rare visitor to Britain.

GREAT BUSTARD (*OTIS TARDA*), IN HABITS SOUTHERN EUROPE, WESTERN ASIA AND NORTHERN AFRICA

**BUSTO ARSIZIO**, urban district, Italy, province of Milan, 21 m. N.W. of Milan. Pop. (1921) 24,057 (town), 27,568 (commune). The fine domed S. Maria di Piazza (1517) is from Bramante's designs: the picture over the high altar is one of Gaudenzio Ferrari's best works. Busto Arsizio is an active manufacturing town with cotton factories, etc.

**BUTADES**, of Sicyon, wrongly called DIBUTADES, the first Greek modeller in clay. The story is that his daughter, who loved a youth at Corinth, where they lived, drew upon the wall the outline of his shadow, and that upon this outline her father modelled a face of the youth in clay and baked the model along with the clay tiles which it was his trade to make. This model was preserved in Corinth till Mummius sacked that town. He is also said to have invented a mixture of clay and ruddle, or to have introduced the use of a special kind of red clay (Pliny, *Nat. Hist.* xxxv. 12 [43]). He is said to have lived about 600 B.C.

**BUTANE** ( $C_4H_{10}$ ) is the fourth in the series of paraffin hydro-carbons of the general formula  $C_nH_{2n+2}$  and has one isomer. Normal butane boils at about the freezing point of water and has a Beaumé gravity of 109. Both crude petroleum and natural gas come from wells and in most cases a mixture of oil and gas is obtained simultaneously. Butane lies in the border zone and occurs in considerable quantities in both products. In the early days of petroleum refining most of the butane was lost in both the field and refinery operations since it was too volatile to condense in ordinary condensers. To-day both field and refinery gases are being scrubbed with oil or compressed to recover the butane as a liquid, in which form it has more value than as a gas. In order to utilize liquid butane commercially it is necessary to free it from dissolved gases, such as the lower members of the same series—ethane and propane, as their presence increases the volatility of the butane to such an extent that its storage and use becomes almost impossible.

The modern development of the butane industry has come about through the perfection of processes for the manufacture of "natural gasolene" from natural gas and refinery gases and in particular for the fractionation of this hydro-carbon mixture into its components. In modern natural gasolene plants practically all of the butane is extracted from the gas and used either as part of the gasolene or as liquid butane. When propane is absent butane has a sufficiently low vapour pressure at ordinary temperatures to enable it to be shipped safely in tank cars or other containers and yet will completely evaporate when the pressure is relieved to give a gas of about four times the heating power of ordinary manufactured gas. It has been successfully tried out as a substitute for gas oil for the enrichment of illuminating gas and its uses as a solvent have been studied. Mixed with propane it is sold in cylinders for household heating and for isolated illuminating plant. Butene, the corresponding unsaturated hydro-carbon found in gases from cracking stills, shares all the properties listed

above for butane and in addition serves as the starting point for the manufacture of synthetic alcohols.

**BUTCHER, SAMUEL HENRY** (1850–1910), British scholar, was born in Dublin and educated at Marlborough and Trinity college, Cambridge. He was senior classic (1873); assistant master at Eton; then fellow and lecturer in classics at Trinity (1874); tutor and fellow of University college (1876); and professor of Greek at Edinburgh (1882). In 1904 he resigned and settled in London. In 1906 he was elected Unionist member for Cambridge university. Butcher sat on several royal commissions on education and was president in turn of the English Classical Association, the Irish Classical Association and the British Academy. In 1908 he was made a trustee of the British Museum.

His works include *Some Aspects of the Greek Genius* (1891); *Aristotle's Theory of Poetry and Fine Art* (1895); *Greek Idealism in the Common Things of Life* (1901); and *Harvard Lectures on Greek Subjects* (1904). In 1887 he published, in collaboration with Andrew Lang, a prose translation of the *Odyssey*.

**BUTCHER**, one who cuts and trims meat for cooking. He must be thoroughly experienced in handling meats and must know the different qualities. If selling forms a part of his duties he should be well versed in figures and methods of salesmanship. Mutual protection societies, known as Butchers' Guilds, have existed since the 12th century, and there still stands in Haarlem, Holland, the home of the Butchers' Guild of that city, famed as a memorial both to the architecture and prevailing spirit among trade organizations of that day. The Butchers' National Protective Association of the United States of America, founded in St. Louis, Mo., in May, 1886, is its first American prototype. Preservation and proper care of meat as a matter of public health has been emphasized for centuries. In 1266 a Food act passed in England punished the sellers of diseased meat by putting the offending butchers in the pillory and slowly roasting in front of them the malodorous carcasses. The official census of 1920 estimated the number of butchers in the United States at 866 per million of population for that year.

**BUTE, JOHN STUART**, 3RD EARL OF (1713–1792), English prime minister, son of James, 2nd earl, and of Lady Jane Campbell, daughter of the 1st duke of Argyll, was born on May 25, 1713; he was educated at Eton and succeeded to the earldom (in the peerage of Scotland; created for his grandfather Sir James Stuart in 1703) on his father's death in 1723. He was elected a representative peer for Scotland in 1737, but not in the following parliaments, and appears not to have spoken in debate. In 1738 he was made a knight of the Thistle, and for several years lived in retirement in Bute, engaged in agricultural and botanical pursuits. From the quiet obscurity for which his talents and character entirely fitted him Bute was forced by a mere accident. He had resided in England since the rebellion of 1745, and in 1747, a downpour of rain having prevented the departure of Frederick, prince of Wales, from the Egham races, Bute was summoned to his tent to make up a whist party; he immediately gained the favour of the prince and princess, became the leading personage at their court, and in 1750 was appointed by Frederick a lord of his bedchamber. After the latter's death in 1751 his influence in the household increased. His relations with the princess formed the subject of numerous popular lampoons, but the scandal was never founded on anything but conjecture and the malice of faction. Bute became the constant companion and confidant of the young prince. In the year 1755 he took part in the negotiations between Leicester House and Pitt, directed against the duke of Newcastle, and in 1757 in the conferences between the two ministers which led to their taking office together.

On the accession of George III. in 1760, Bute became a privy councillor, groom of the stole and first gentleman of the bedchamber, and though without a seat in parliament or in the cabinet, he was the only man who enjoyed the king's complete confidence. George III. immediately proceeded in his attempt to accomplish his long-projected plans, the conclusion of the peace with France, the break-up of the long-continued Whig monopoly of power, and the supremacy of the monarchy over both parliament and the political parties.

His policy was followed with consummate skill and caution. Great care was shown not to alienate the Whig leaders in a body, which would have raised up under Pitt's leadership a formidable party of resistance, but advantage was taken of disagreements between the ministers concerning the war, of personal jealousies, and of the strong reluctance of the old statesmen who had served the crown for generations to identify themselves with active opposition to the king's wishes. They were all discarded singly and isolated, after violent disagreements, from the rest of the ministers. On March 25, 1761, Bute succeeded Lord Holderness as secretary of state for the northern department, and Pitt resigned in October on the refusal of the government to declare war against Spain.

On Nov. 3 Bute appeared in his new capacity as prime minister in the House of Lords, where he had not been seen for 20 years. Though he had succeeded in disarming all organized opposition in parliament, the hostility displayed against him in the nation, arising from his Scottish nationality, his character as favourite, his peace policy and the resignation of the popular hero Pitt, was overwhelming. He was the object of numerous attacks and lampoons. He dared not show himself in the streets without the protection of prize-fighters, while the jack-boot (a pun upon his name) and the petticoat, by which the princess was represented, were continually being burnt by the mob or hanged upon the gallows. On Nov. 9, while proceeding to the Guildhall, he narrowly escaped falling into the hands of the populace, who smashed his coach, and he was treated with studied coldness at the banquet. In Jan. 1762 Bute was compelled to declare war against Spain, though now without the advantages which the earlier decision urged by Pitt could have secured, and he supported the war, but with no zeal and no definite aim beyond the obtaining of a peace at any price and as soon as possible. In May he succeeded the duke of Newcastle as first lord of the treasury. In his eagerness for peace he conducted on his own responsibility secret negotiations for peace with France through Viri, the Sardinian minister, and the preliminary treaty was signed on Nov. 3 at Fontainebleau. A parliamentary majority was now secured, with the aid of Henry Fox, who deserted his party to become leader of the Commons, for the king's policy by bribery and threats. The definitive peace of Paris was signed on Feb. 10, 1763, and a wholesale proscription of the Whigs was begun, in which even the most insignificant adherents of the party, including widows, servants and schoolboys, incurred the vengeance of the court. Later, Bute roused further hostility by his cider tax, an ill-advised measure producing only £75,000 a year, imposing special burdens upon the farmers and landed interest in the cider counties, and extremely unpopular because extending the detested system of taxation by excise, regarded as an infringement of the popular liberties. At length, unable to contend any longer against the general and inveterate animosity displayed against him, fearing for the consequences to the monarchy, alarmed at the virulent attacks of the *North Briton*, and suffering from ill-health, Bute resigned on April 8 an office he had never desired to fill.

He still for a time retained influence with the king, but George Grenville (whom he recommended as his successor) insisted on possessing the king's whole confidence, and on the failure of Bute in Aug. 1763 to procure his dismissal and to substitute a ministry led by Pitt and the duke of Bedford, Grenville demanded and obtained Bute's withdrawal from the court. He resigned accordingly the office of privy purse, and took leave of George III. on Sept. 28. He still corresponded with the king, and returned again to London next year, but in May 1765, after the duke of Cumberland's failure to form an administration, Grenville exacted the promise from the king which appears to have been kept faithfully, that Bute should have no share and should give no advice whatever in public business, and obtained the dismissal of Bute's brother from his post of lord privy seal in Scotland. Bute continued to visit the princess of Wales, but on the king's arrival always retired by a back staircase.

He spoke against the government on the American question in Feb. 1766, and in March against the repeal of the Stamp Act. In 1768 and 1774 he was again elected a representative peer for

Scotland, but took no further part in politics, and in 1778 refused to have anything to do with the abortive attempt to effect an alliance between himself and Chatham. He travelled in Italy, complained of the malice of his opponents and of the ingratitude of the king, and determined "to retire from the world before it retires from me." He died on March 10, 1792, and was buried at Rothesay in Bute.

Bute in his short administration was used by George III. as his instrument for the destruction of the Whig Party. His own principles and intentions were inspired by feelings of sincere affection and loyalty for his sovereign, and his character remains untarnished by the grosser accusations raised by faction. In the circle of his family and intimate friends, away from the great world in which he made so poor a figure, he was greatly esteemed.

See J. A. Lovat Fraser, *John Stuart, Earl of Bute* (1912); Mrs. E. Stuart Wortley, *A Prime Minister and his Son*. From the correspondence of the Earl of Bute and of Lt. General the Hon. Sir Charles Stuart (1925). See also WILKES, JOHN.

**BUTE or BUTESHIRE**, an insular county in south-west Scotland, consisting of the islands of Bute, from which the county takes its name, Arran, Great Cumbrae, Little Cumbrae, Holy Island, Pladda and Inchmarnock, all lying in the Firth of Clyde, between Ayrshire on the east and Argyllshire on the west and north. Area 218 square miles. Pop. (1921) 33,711 because the census was taken in the tourist season; (1931) 18,822. In 1931 the number of persons who spoke Gaelic and English was 927. The county unites with northern Ayrshire in returning one member to parliament. Buteshire and Renfrewshire form one sheriffdom, with a sheriff-substitute resident in Rothesay. The circuit courts are held at Inveraray. Staple crops are oats, potatoes and turnips; cattle, sheep and horses are reared. Herring and white fisheries are of some importance. Rothesay fishery district includes all creeks in Buteshire and a few in Argyll and Dumbarton shires, the Cumbraes being grouped with the Greenock district. During the season many fishermen are employed on the Clyde yachts, Rothesay being a prominent yachting centre. There is regular steamer communication throughout the year between the county ports of Rothesay, Millport, Brodick and Lamlash and the mainland ports of Glasgow, Greenock, Gourock, Ardrossan and Wemyss bay.

**BUTE**, the most important, though not the largest, of the islands constituting the county of the same name, in the Firth of Clyde, Scotland, about 18m. S.W. of Greenock and 40m. by water from Glasgow. Pop. (1921) 19,465. It is bounded on the north and west by the lovely Kyles of Bute, the narrow winding strait which separates it from Argyllshire; on the east by the Firth of Clyde, and on the south and south-west by the Sound of Bute, about 6m. wide, which divides it from Arran. Its area is about 49sq.m., its length 15½m., and its breadth from 4½ to one mile. Its highest point, Kames hill, in the north, is 911 feet. This part of the island is composed mainly of the metamorphic rocks of the eastern Highlands, mica schists, interrupted by a belt of clay slate such as fringes the Highlands across the mainland right to Stonehaven; the south of the island consists mainly of upper Old Red Sandstone, with many intrinsic igneous rocks. On account of its pleasant scenery, mild climate and lower rainfall than occurs over much of the western coast, added to its fertile soil and proximity to the Clyde estuary, the island is relatively populous and a favoured residential and holiday resort from Glasgow. About two-thirds of the island are arable, yielding potatoes for the Glasgow market, oats and turnips. Many burns water the island, and there are six lochs among which Loch Fad, about 1m. S. of Rothesay, was the source of the power used in the Rothesay cotton-spinning mill, the first of the kind erected in Scotland. The island is well served by steamers from Glasgow and other Clyde ports, and there are piers at Kilchattan, Craigmore, Port Bannatyne and the chief port and old royal burgh of Rothesay (*q.v.*). The fisheries of the island are of value.

The name of the island is variously derived from the Erse, *both* (or a "cell") in allusion to St. Brendan's foundation here in the 6th century, and from the Gaelic *Ey Bhiod*, "the island of corn," in reference to its fertility. Stone monuments, barrows,

cairns and cists, with the remains of ancient chapels, attest its early settlements.

See J. K. Hewison, *Bute in the Olden Time* (1895).

**BUTIVATS:** see CASTE.

**BUTLER**, the name of a family famous in the history of Ireland. The great house of the Butlers, alone among the families of the conquerors, rivalled the Geraldines, their neighbours, kinsfolk, and mortal foes. Theobald Walter, their ancestor, was not among the first of the invaders. He was the grandson of one Hervey Walter who, in the time of Henry I., held Witheron or Weeton in Amounderness, a small fee of the honour of Lancaster, the manor of Newton in Suffolk, and certain lands in Norfolk. Hubert his son accompanied King Richard to the Holy Land, and became bishop of Salisbury and (1193) archbishop of Canterbury. "Wary of counsel, subtle of wit," he was the champion of Canterbury and of England, and the news of his death drew the cry from King John that "now, for the first time, am I king in truth."

Theobald Walter, the eldest brother of the archbishop, went over sea to Waterford in 1185 with John, the king's son, the freight of the harness sent after him being charged in the Pipe Roll. Clad in that harness he led the men of Cork when Dermot MacCarthy, prince of Desmond, was put to the sword, John rewarding his services with lands in Limerick and with the important fief of Arklow in the vale of Avoca, where he made his Irish seat and founded an abbey. Returning to England he accompanied his uncle Randolph de Glanville to France, both witnessing a charter delivered by the king at Chinon when near to death. Soon afterwards, Theobald Walter was given by John that hereditary office of butler to the lord of Ireland, which makes a surname for his descendants.

Adding to its possessions by marriages the house advanced itself among the nobility of Ireland. On Sept. 1, 1315, its chief, Edmund Walter *alias* Edmund the Butler, for services against the Scottish raiders and Ulster rebels, had a charter of the castle and manors of Carrick, Macgriffyn and Roscrea to hold to him and his heirs *sub nomine et honore comitis de Karryk*. James, the son and heir of Edmund, having married in 1327 Eleanor de Bohun, daughter of Humfrey, earl of Hereford and Essex, high constable of England, by a daughter of Edward I., was created an Irish earl on Nov. 2, 1328, with the title of Ormonde.

From the early years of the 14th century the Ormonde earls, generation by generation, were called to the chief government of Ireland as lords-keeper, lords-lieutenant, deputies or lords-justices, and, unlike their hereditary enemies the Geraldines, they kept a tradition of loyalty to the English crown and to English custom. Their history is full of warring with the native Irish, and as the sun stood still upon Gibeon, even so, we are told, it rested over the red bog of Athy while James the White Earl was staying the Wild O'Mores. More than one of the earls of Ormonde had the name of a scholar, while of the 6th earl, master of every European tongue and ambassador to many courts, Edward IV. is said to have declared that were good breeding and liberal qualities lost to the world they might be found again in John, earl of Ormonde. The earls were often absent from Ireland on errands of war or peace. James, the 5th earl, had the English earldom of Wiltshire given him in 1449 for his Lancastrian zeal. He fought at St. Albans in 1455, casting his harness into a ditch as he fled the field, and he led a wing at Wakefield. His stall plate as a knight of the Garter is still in St. George's chapel. Defeated with the earl of Pembroke at Mortimer's Cross and taken prisoner after Towton, his fate is uncertain, but rumour said that he was beheaded at Newcastle, and a letter addressed to John Paston about May 1461 sends tidings that "the Erle of Wylchir is hed is sette on London Brigge."

The Wiltshire earldom died with him and the Irish earldom was for a time forfeited, his two brothers, John and Thomas, sharing his attainder. John was restored in blood by Edward IV.; and Thomas, the 7th earl, summoned to the English parliament in 1495 as Lord Rochford, a title taken from a Bohun manor in Essex, saw the statute of attainder annulled by Henry VII.'s first parliament. He died without male issue in 1515. Of his two daughters and co-heirs Anne was married to Sir James St. Leger, and Margaret to Sir William Boleyn of Blickling, by whom she

was mother of Sir James and Sir Thomas Boleyn. The latter, the father of Anne Boleyn, was created earl of Wiltshire and Ormonde in 1529.

In Ireland the heir male of the Ormonde earls, Sir Piers Butler—"Red Piers"—assumed the earldom of Ormonde in 1515 and seized upon the Irish estates. In 1522, styled "Sir Piers Butler pretending himself to be earl of Ormonde," he was made chief governor of Ireland as lord deputy, and on Feb. 23, 1528, following an agreement with the co-heirs of the 7th earl, whereby the earldom of Ormonde was declared to be at the king's disposal, he was created earl of Ossory. But the Irish estates, declared forfeit to the Crown in 1536 under the Act of Absentees, were granted to him as "earl of Ossory and Ormonde." His son and heir, James the Lame, who had been created Viscount Thurles on Jan. 2, 1536, obtained an act of parliament in 1543-44 which, confirming the grant to his father of the earldom, gave him the old "pre-eminence" of the ancient earldom of 1328.

Earl James was poisoned at a supper in Ely House in 1546, and Thomas the Black Earl, his son and heir, was brought up at the English court, professing the reformed religion. His sympathies were with the Irish, although he stood staunchly for law and order, and for the greater part of his life he was wrestling with rebellion. His lands having been harried by his hereditary enemies the Desmond Geraldines, Elizabeth gave him his revenge by appointing him in 1580 military governor of Munster, with a commission to "banish and vanquish these cankered Desmonds," then in open rebellion. In three months, by his own account, he had put to the sword 46 captains, 800 notorious traitors and 4,000 others, and, after four years' fighting, Gerald, earl of Desmond, a price on his head, was taken and killed. Dying in 1614 without lawful issue, Thomas was succeeded by his nephew Walter of Kilcash, who had fought beside him against the Burkes and O'Mores. But Sir Robert Preston, afterwards created earl of Desmond, claimed a great part of the Ormonde lands in right of his wife, the Black Earl's daughter and heir. In spite of the loyal services of Earl Walter, King James supported the claimant, and the earl, refusing to submit to a royal award, was thrown into gaol, where he lay for eight years in great poverty, his rents being cut off. Although liberated in 1625 he was not acknowledged heir to his uncle's estates until 1630. His son, Viscount Thurles, being drowned on a passage to England, a grandson succeeded him.

This grandson, James Butler, is perhaps the most famous of the long line of Ormondes. By his marriage with his cousin Elizabeth Preston, the Ormonde titles were once more united with all the Ormonde estates. A loyal soldier and statesman, he commanded for the king in Ireland, where he was between the two fires of Catholic rebels and Protestant parliamentarians. In Ireland he stayed long enough to proclaim Charles II. in 1649 but defeated at Rathmines, his garrisons broken by Cromwell, he quitted the country at the end of 1650. At the Restoration he was appointed lord-lieutenant, his estates having been restored to him with the addition of the county palatine of Tipperary, taken by James I. from his grandfather. In 1632 he had been created a marquess. The English earldom of Brecknock was added in 1660 and an Irish dukedom of Ormonde in the following year. In 1682 he had a patent for an English dukedom with the same title. Buckingham's intrigues deprived him for seven years of his lord-lieutenancy, and a desperate attempt was made upon his life in 1670, when a company of ruffians dragged him from his coach in St. James's street and sought to hurry him to the gallows at Tyburn. His son's threat that, if harm befell his father he would pistol Buckingham, even if he were behind the king's chair, may have saved him from assassination. At the accession of James II. he was once more taken from active employment. He died at his Dorsetshire house in 1688. He had seen his great-great-uncle the Black Earl, who was born in 1532, and a great-grandson was playing beside him a few hours before his death. His brave son Ossory, "the eldest hope with every grace adorned," died eight years before him, and he was succeeded by a grandson James, the second duke of Ormonde, who, a recognized leader of the London Jacobites, was attainted in 1715, his honours and estates being forfeited. The duke lived 30 years in exile, chiefly at Avignon, and died in the rebellion year of

1745 without surviving issue. His younger brother Charles, whom King William had created Lord Butler of Weston in the English peerage and earl of Arran in the Irish, was allowed to purchase the Ormonde estates. On the earl's death without issue in 1758 the estates were enjoyed by a sister, passing in 1760, by settlement of the earl of Arran, to John Butler of Kilcash, descendant of a younger brother of the first duke. John, dying six years later, was succeeded by Walter Butler, a first cousin, whose son John, heir-male of the line of Ormonde, became earl of Ormonde and Ossory and Viscount Thurles in 1791, the Irish parliament reversing the attainder of 1715. Walter, son and heir of the restored earl, was given an English peerage as Lord Butler of Llanthony (1801) and an Irish marquessate of Ormonde (1816), titles that died with him. This Lord Ormonde in 1810 sold to the crown for the great sum of £216,000 his ancestral right to the prisage of wines in Ireland. For his brother and heir, created Lord Ormonde of Llanthony at the coronation of George IV., the Irish marquessate was revived in 1825 and descended in the direct line.

The earls of Carrick (Ireland 1748), viscounts Ikerrin (Ireland 1629), claim descent from a brother of the first Ormonde earl, while the viscounts Mountgarret (Ireland 1550) spring from a younger son of Piers, the Red Earl of Ossory. The barony of Caher (Ireland 1543), created for Sir Thomas Butler of Chaier or Caher-down-Eske, a descendant in an illegitimate branch of the Butlers, fell into abeyance among heirs general on the death of the 2nd baron in 1560. It was again created, after the surrender of their rights by the heirs general, in 1583 for Sir Theobald Butler (d. 1596), and became extinct in 1858 on the death of Richard Butler, 13th baron and 2nd viscount Caher, and second earl of Glengall. Buttlar von Clonebough, *genannt* Haimhausen, count of the Holy Roman Empire, descends from the 3rd earl of Ormonde, the imperial title having been revived in 1681 in memory of the services of a kinsman, Walter, Count Butler (d. 1634), the dragoon officer who carried out the murder of Wallenstein.

See Lancashire Inquests, 1205-1307; Lancashire and Cheshire Record Society, xlviii; Chronicles of Matthew Paris, Roger of Hoveden, Giraldus Cambrensis, etc.; *Dictionary of National Biography*; G.E.C.'s *Complete Peerage*; Carte's Ormonde papers; Paston Letters; Rolls of parliament, fine rolls, liberate rolls, pipe rolls, etc.

**BUTLER, ALBAN** (1710-1773), English Roman Catholic priest and hagiologist, was born in Northampton on Oct. 24, 1710. He was educated at the English college, Douai, where on his ordination to the priesthood in 1735, he held successively the chairs of philosophy and divinity. After some years spent in England he became president of the English seminary at St. Omer, where he remained till his death on May 15, 1773. Butler's great work *The Lives of the Saints*, the result of 30 years' study (1756-59), has passed through many editions and translations (best edition, including valuable notes, Dublin 1779-80).

See *An Account of the Life of A. B. by C. B.*, i.e. by his nephew Charles Butler (1799); and Joseph Gillow's *Bibliographical Dictionary of English Catholics*, vol. i.

**BUTLER, BENJAMIN FRANKLIN** (1818-1893), American lawyer, soldier and politician, was born in Deerfield, N.H., on Nov. 5, 1818. He graduated from Waterville (now Colby) College in 1838, was admitted to the Massachusetts bar in 1840, began practice at Lowell, Mass., and early attained distinction as a lawyer, particularly in criminal cases. Entering politics as a Democrat, he was a member of the Massachusetts house of representatives in 1853, and of the State senate in 1859, and was a delegate to the Democratic national conventions from 1848 to 1860. In that of 1860 at Charleston he supported the movement that nominated Breckinridge and divided the party.

After the opening of the Civil War, Butler joined the Union Army, and took possession of Baltimore without bloodshed. While in command at Fortress Monroe, he agreed to return fugitive slaves to their owner only on the condition that the owner, a Virginian colonel, take an oath of allegiance to the United States. In commenting on the decision, Blair wrote Butler he was correct in regarding negroes as "contraband of war," thus originating the phrase "contraband" as applied to the negroes. In the conduct of tactical operations Butler was almost uniformly unsuccessful, and his first action at Big Bethel, Va., was a humiliating defeat for

the national arms. In 1862 he commanded the force which occupied New Orleans. In the Administration of that city he showed firmness and severity. Many of his acts, however, gave great offence, particularly the seizure of \$800,000 which had been deposited in the office of the Dutch consul, and an order, issued after some provocation on May 15, that if any woman should "insult or show contempt for any officer or soldier of the United States, she shall be regarded and shall be held liable to be treated as a woman of the town plying her avocation." This order provoked a storm of protests and was doubtless the cause of his removal in Dec. 1862. In the campaign of 1864 he commanded the Army of the James creditably in several battles. But his mismanagement of the expedition against Ft. Fisher (N.C.), led to his recall by General Grant in December.

He was a Republican representative in Congress from 1867 to 1879, except in 1875-77. In Congress he was conspicuous as a Radical Republican in reconstruction legislation, and helped to conduct the impeachment of President Johnson; he was regarded as President Grant's spokesman in the House, and one of the foremost advocates of the payment in "greenbacks" of the Government bonds. As a candidate for governor of Massachusetts, he was twice defeated, but in 1882 he was elected by the Democrats. After bitterly opposing Grover Cleveland as presidential nominee for the Democratic Party he ran on the ticket of the Greenback Party, and was defeated (1884). He was an able but erratic administrator and soldier, and a brilliant lawyer. Many charges of corruption were made against him, apparently well substantiated. He died at Washington, D.C. on Jan. 11, 1893.

See James Parton, *Butler in New Orleans* (1863), *The Autobiography and Personal Reminiscences of Major-General B. F. Butler: Butler's Book* (1893), none too accurate; and Gamaliel Bradford, *Damaged Souls* (1923).

**BUTLER, CHARLES** (1750-1832), British lawyer and miscellaneous writer, was born in London on Aug. 14, 1750, and died there on June 2, 1832. He was educated at Douai and in 1775 entered Lincoln's Inn. He practised conveyancing, and after the passing of the Roman Catholic Relief Act 1791 he was the first Roman Catholic to be called to the bar, since 1688. Butler acted as secretary to the Committees on Penal Reform formed by Roman Catholic laymen in 1782 and 1787. The number of his published works comprises about fifty volumes.

A complete list of Butler's works is contained in Joseph Gillow's *Bibliographical Dictionary of English Catholics*, vol. i. pp. 357-364.

**BUTLER, HENRY MONTAGU** (1833-1918), English educationist, head master of Harrow School (1859-85), and master of Trinity college, Cambridge (1886-1918), was born at Gayton, Northants, on July 2, 1833, the son of Dr. GEORGE BUTLER, dean of Peterborough, who had been head master of Harrow (1805-29). His elder brother was GEORGE BUTLER (1819-90), canon of Winchester, whose wife, Josephine, is separately mentioned. H. M. Butler was educated at Harrow and Trinity college, Cambridge. He became President of the Union and Senior Classic in 1855, and in 1856 was appointed private secretary to W. F. Cowper, afterwards Lord Mount Temple. He was also secretary to the commission for rebuilding the National Gallery. He became head master of Harrow in 1859, and made many important changes in the school, notably by giving science a formal place in the curriculum, but although he insisted on efficient "modern" teaching, his rule at Harrow is principally associated with the development of the traditions of the school, and by the added importance given to music. In 1885 he became dean of Gloucester, and though his mastership at Harrow terminated, he continued to take an interest in the school, and in 1901 was elected a governor. He became master of Trinity college, Cambridge in 1886, and was vice-chancellor of Cambridge University in the years 1889-90. Under Butler, Trinity college became a centre for many outside activities, and its head formed a link between religious bodies of different kinds. Butler began the annual reunions of Trinity men. His first wife, Georgina Elliot, had died in 1883, and he married in 1888 Agnata Frances, daughter of Sir James Ramsay of Bamf, the historian. Mrs. Butler had been placed by the examiners

above the Senior Classic at Cambridge in 1887. Butler died at Cambridge on Jan. 14, 1918.

See his *Leisure Hours of a Long Life* (1914); J. R. M. Butler, *Henry Montagu Butler, Master of Trinity College, Cambridge, 1886-1918* (1925).

**BUTLER, JOSEPH** (1692-1752), English divine and bishop of Durham, was born on May 18, 1692, at Wantage, Berkshire. He came of Presbyterian parentage, and was sent to the dissenting academy of Samuel Jones at Gloucester, and later to Tewkesbury. While there, Butler became dissatisfied with Presbyterianism, and after much deliberation resolved to join the Church of England. In 1715 he entered Oriel college, Oxford, and after taking his degree three years later, was ordained deacon and priest. He was nominated preacher at the Rolls Chapel where he continued until 1726. It was there that he preached his famous *Fifteen Sermons* (1726) including the well-known three on human nature. In 1721 he received a prebend at Salisbury from Bishop Talbot, who on his translation to Durham gave Butler the living of Houghton-le-Skerne and in 1725 presented him to the wealthy rectory of Stanhope where he remained for ten years. In 1733, Butler was made chaplain to Lord Chancellor Talbot, and three years later prebendary of Rochester. In the same year he was appointed clerk of the closet to the queen and published the *Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature*.

In 1737 Queen Caroline died. Her recommendation of Butler to the favour of her husband led to his appointment in 1738 to the bishopric of Bristol, the poorest see in the kingdom. The severe but dignified letter to Walpole accepting the preferment showed that the slight was resented. Two years later, however, Butler was presented to the rich deanery of St. Paul's, and in 1746 was made clerk of the closet to the king. In 1747 the primacy was offered to him but declined on the ground that "it was too late for him to try to support a falling church." Nevertheless in 1750 he accepted the see of Durham. He died on June 16, 1752, at Bath, and was buried in Bristol cathedral, a monument with an epitaph by Southey being erected over his grave in 1834. According to his wishes, all his mss. were burned after his death. Butler never married.

Butler's great work, *The Analogy of Religion, Natural and Revealed, to the Course and Constitution of Nature*, which was so often appealed to in the 19th century, is essentially a work of its period, being an indirect attack on the prevailing deistical speculations (see *DEISM*). Its author begins by presupposing with the deists the existence of God, and contending that religion cannot lie wholly within the sphere of reason, aims to show that the difficulties raised by the deists against religion have analogies in nature. That there should be these difficulties in both realms is inevitable because of the limitations of our imperfect human faculties. No *a priori* construction of experience is possible; we must slowly advance through the individual facts of the universe which lead us only to a greater degree of probability. If we had a complete knowledge of the parts, we should, like God, know the whole.

Butler next considers certain religious tenets that have been selected by the deists as unreasonable and attempts to prove that there is every ground for inferring their probable truth. Thus he asserts that the conception of the future life, with which all our hopes and fears are bound up, is not unreasonable because not irreconcilable with what we know of the course of nature. Declaring that we do not really know the soul to be extended and therefore, destructible, Butler proceeds to show that the conception of the future life is supported by the changes in man during his lifetime, by the possibility of certain of our faculties being suspended during sleep, etc., without being destroyed, by the teaching of experience regarding our temporal rewards and punishments, by the strong evidence for the moral government of this world by God, and by the disciplinary character of this life.

Part II. of the *Analogy* deals with revealed religion. Here Butler urges the importance of revelation as supplementing and not contradicting reason, though he admits that its content can only be obscurely comprehended. True revelation cannot oppose the

dictates of conscience, for both come from God. After putting the case for miracles and emphasizing the importance of the death of Christ as the means of redemption, Butler restrikes the keynote of the *Analogy* by declaring in the final chapter that while the evidences for revealed religion, *i.e.*, Christianity, do not amount to demonstration, they are in the highest degree probable.

The systematic account of the moral nature of man, which alone gives value to an enquiry into religion, is set forth by Butler in the famous *Fifteen Sermons*, especially in the first three, *Upon Human Nature*. The three primary factors of human nature are passions and affections, self-love and benevolence, and conscience. Benevolence he develops at some length, showing against Hobbes that man is intended by nature for society and to benefit society, but by regarding it less as a definite desire for the general good as such than as affection for particular individuals, Butler practically eliminates it as a regulative principle. Man's ethical nature, for him, is an organic unity in which conscience, whose function it is to reveal the law of our nature, reigns supreme and the inferior elements are subordinated to the superior ones. Virtue, then, consists in following conscience, but Butler unfortunately gives no satisfactory answer to the enquiry, what course of action is approved by conscience? He seems to think that everyone knows what virtue is, and that between human nature and virtue there is a sort of pre-established harmony. Among the remaining 12 sermons those on compassion and those on the love of our neighbour concern the doctrines of Hobbes.

**BIBLIOGRAPHY.**—Of the many editions of the *Analogy* the best are those by W. Fitzgerald (1849) containing a valuable biography, by W. E. Gladstone (1897) the second vol., including the *Sermons*, and by J. H. Bernard (1900) which also includes the *Sermons*. See T. Bartlett, *Memoirs of Butler* (1839); A. E. Baker, *Bishop Butler* (1923); T. Lorenz, *Beitrag zur Lebensgeschichte von J. Butler* (1900) and his *Weitere Beiträge . . .* (1901). For the religious history of Butler's times, see G. V. Lechler, *Gesch. d. Engl. Deismus* (1841); M. Pattison, *Essays and Reviews* (1889); J. Hunt, *Religious Thought in England* (1870-73); L. Stephen, *English Thought in the 18th century* (1902); J. H. Overton and F. Relton, *The English Church from the Accession of George I. to the End of the 18th century* (1906).

**BUTLER, JOSEPHINE ELIZABETH** (1828-1906), English social reformer, was born on April 13, 1828, at Glendale, Northumberland, the daughter of John Grey, and died at Wooler, Northumberland, on Dec. 30, 1906. She married (1852) George Butler, and spent the first five years of her married life at Oxford, where her husband was a tutor. The Butlers settled in Liverpool in 1866, and Mrs. Butler helped to establish homes for prostitutes. Three years later she began to take a prominent part in the agitation for the repeal of the contagious diseases acts and became hon. sec. of the ladies' national association for their repeal. For 16 years she worked indefatigably on this question, and the incidents of this campaign, which included interventions at by-elections and visits to the continent to secure international action on the suppression of the "white slave traffic," are related in her *Personal Reminiscences of a Great Crusade* (1896). Mrs. Butler's agitation undoubtedly influenced the reforms in the state regulation of prostitution by many European governments. Of her other writing may be noticed *Rebecca Jarrett* (1886), which was a defence of a witness at the trial of W. T. Stead; and *Native Races and the War* (1900), a defence of the British Government in South Africa.

See W. T. Stead, *Josephine Butler* (1888); G. W. and L. A. Johnson, *Josephine E. Butler* (1909); Millicent G. Fawcett and E. M. Turner, *Josephine Butler* (1928).

**BUTLER, NICHOLAS MURRAY** (1862- ), American educator and publicist, was born at Elizabeth (N.J.) on April 2, 1862. He graduated at Columbia college in 1882, was a graduate fellow in philosophy there from 1882 to 1884, taking the degree of Ph.D. He then studied for a year in Paris and Berlin. He was an assistant in philosophy at Columbia in 1885-86, tutor in 1886-89, adjunct professor of philosophy, ethics and psychology in 1889-90, becoming full professor in 1890, and dean of the faculty of philosophy in 1890-1902. From 1886 until 1891 he was the first president of the New York college for the training of teachers (later Teachers' college of Columbia university), which he had personally planned and organized. In 1889 he

founded and for 30 years edited *The Educational Review*, an influential educational magazine. He soon came to be looked upon as one of the foremost authorities on educational matters in America, and in 1894 was elected president of the National educational association. He was also a member of the New Jersey State board of education from 1887 to 1895, and was president of the Paterson (N.J.) board of education in 1892-93. In 1901 he succeeded Seth Low as president of Columbia university. He is also president of Barnard college, Teachers college, the New York college of pharmacy (since 1904) and since 1928 of St. Stephen's college, Annandale-on-Hudson.

He was elected a member of the American academy of arts and letters in 1911. In 1912 he was chairman of the New York State Republican convention and also a delegate of the Republican national convention. Vice-President Sherman was renominated, but died shortly before the general election, and the Republican electoral votes were cast for Dr. Butler for vice president. He was, however, overwhelmingly defeated on the ticket with President Taft, Wilson receiving an electoral vote of 435 (40 States), Roosevelt 88 (6 States) and Taft 8 (2 States). In 1916, 1920, 1924 and 1928 he was a delegate to the Republican national convention. He was an early and pronounced advocate of the repeal of the 18th Amendment on the grounds (1) that it was a revolutionary departure from the plan of Federal government with its distribution of powers between the Nation and the States as established by the Constitution, and (2) that it was a most ineffective method of combating the evils of the saloon and the liquor traffic. He favoured woman suffrage and advocated the short ballot. At the Republican national convention in 1920 he received 69½ votes for the presidential nomination on the first ballot, the number gradually falling to two on the tenth and last ballot.

As an educator Butler was a bold critic of many contemporary tendencies in American education. He upheld the old theory of mental discipline, and in the face of widespread vocational movement in schools and colleges remained a steadfast and eloquent defender of liberal education. Under his guidance Columbia university became a cosmopolitan institution, and its total registration in 1928, including university extension and summer session, Barnard, Teachers' college and the College of Pharmacy, was 36,639. He was chairman of the national committee of the United States for the restoration of the University of Louvain, destroyed by the Germans in 1914. In 1920 he resigned the editorship of *The Educational Review*. In 1921 he was made grand officier de la Légion d'honneur (officier 1906, commandeur, 1912). In addition he has received decorations from Belgium, Czechoslovakia, Greece, Italy, Poland, Prussia, Rumania and Serbia. In 1923 he became a member of the *Institut de France*, taking the place of the late Lord Bryce, and in the same year, as Watson professor of American history, literature and institutions, he delivered a series of lectures at eight British universities. He has been a trustee of the Carnegie foundation for the advancement of teaching since 1905, and of the Carnegie Corporation since 1925. He has been a strong advocate of international understanding and the betterment of international relations. In 1907 and 1909-12 he was chairman of the Lake Mohonk conference on international arbitration. Since its organization in 1910 he has been a trustee of the Carnegie endowment for international peace and director of its division of intercourse and education, and president of the endowment since 1925. In 1924 he was elected chancellor of the American academy of arts and letters. In addition to editing *The Educational Review* for 30 years he has also edited several series of books, including "The Great Educators" and "The Teachers' Professional Library," and *Education in the United States*, a series of monographs prepared for the United States exhibit at the Paris exposition, 1900 (1900, new ed., 1910). His writings include: *The Meaning of Education* (1898, rev. ed 1915); *True and False Democracy* (1907); *The American as he is* (1908); *Philosophy* (1911); *Why Should We Change Our Form of Government?* (1912); *The International Mind* (1913); *Progress in Politics* (1913, a pamphlet); *The Meaning of Education* (1915, an enlargement of one published in 1898); *A World in Ferment* (1918, interpretations of the War for a new world); *Is America*

*Worth Saving?* (1920); *Scholarship and Service* (1921); *Building the American Nation* (1923); *The Faith of a Liberal* (1924).

**BUTLER** (or BOTELER), **SAMUEL** (1612-1680), English poet, author of *Hudibras*, son of Samuel Butler, a small farmer, was baptized at Strensham, Worcestershire, on Feb. 8, 1612. He was educated at the King's school, Worcester, under Henry Bright, the record of whose zeal as a teacher is preserved by Fuller (*Worthies*, Worcestershire). After leaving school he served a Mr. Jeffereys of Earl's Croome, Worcestershire, in the capacity of justice's clerk. Later on he was recommended to Elizabeth, countess of Kent. At her home at Wrest, Bedfordshire, he had access to a good library, and there, too, he met Selden, who sometimes employed him as his secretary. But his third sojourn, with Sir Samuel Luke at Cople Hoo, Bedfordshire, was not only apparently the longest, but also much the most important in its effects on his career and works. We are nowhere informed in what capacity Butler served Sir Samuel Luke, or how he came to reside in the house of a noted Puritan and Parliament man. In the family of this "valiant Mamaluke," who, whether he was or was not the original of *Hudibras*, was certainly a rigid Presbyterian, "a colonel in the army of the Parliament, scoutmaster-general for Bedfordshire and governor of Newport Pagnell," Butler must have had the most abundant opportunities of studying from the life those who were to be the victims of his satire; he is supposed to have taken some hints for his caricature from Sir Henry Roswell of Ford abbey, Devonshire. But we know nothing positive of him until the Restoration, when he was appointed secretary to Richard Vaughan, 2nd earl of Carbery, lord president of the principality of Wales, who made him steward of Ludlow castle, an office which he held from Jan. 1661 to Jan. 1662. About this time he married a rich lady variously described as a Miss Herbert and as a widow named Morgan. His wife's fortune was afterwards, however, lost.

Early in 1663 *Hudibras: The First Part: written in the Time of the Late Wars*, was published, but this, the first genuine edition, had been preceded in 1662 by an unauthorized one. On Dec. 26 Pepys bought it, and though neither then nor afterwards could he see the wit of "so silly an abuse of the Presbyter knight going to the wars," he repeatedly testifies to its extraordinary popularity. A spurious second part appeared within the year. This determined the poet to bring out the second part (licensed on Nov. 7, 1663, printed 1664), which if possible exceeded the first in popularity. From this time till 1678, the date of the publication of the third part, we hear nothing certain of Butler. On the publication of *Hudibras* he was sent for by Lord Chancellor Hyde (Clarendon), says Aubrey, and received many promises, none of which was fulfilled. He is said to have received a gift of £300 from Charles II., and to have been secretary to George Villiers, 2nd duke of Buckingham, when the latter was chancellor of the University of Cambridge. Butler's satire on Buckingham in his *Characters* (*Remains*, 1759) shows such an intimate knowledge that it is probable the second story is true. Two years after the publication of the third part of *Hudibras* he died, on Sept. 25, 1680, and was buried in the churchyard of St. Paul's, Covent Garden. It appears that he died in extreme poverty. He was, we are told, "of a leonine-coloured hair, sanguine, choleric, middle-sized, strong."

*Hudibras* itself, though probably quoted as often as ever, has dropped into the class of books which are more quoted than read. The poem is of considerable length, extending to more than ten thousand verses, yet Hazlitt hardly exaggerates when he says that "half the lines are got by heart"; indeed a diligent student of later English literature has read a great part of *Hudibras* though he may never have opened its pages. The tableaux or situations, though few and simple in construction, are ludicrous enough. The knight and squire setting forth on their journey; the routing of the bear-baiters; the disastrous renewal of the contest; *Hudibras* and Ralph in the stocks; the lady's release and conditional acceptance of the unlucky knight; the latter's deliberations on the means of eluding his vow; the Skimmington; the visit to Sidrophel, the astrologer; the attempt to cajole the lady, with its woeful consequences; the consultation with the lawyer, and the immortal pair of letters to which this gives rise, complete the argument of

the whole poem. But the story is as nothing; throughout we have little really kept before us but the sordid vices of the sectaries, their hypocrisy, their churlish ungraciousness, their greed of money and authority, their fast and loose morality, their inordinate pride. The extraordinary felicity of the means taken to place all these things in the most ridiculous light has never been questioned. The doggerel metre, never heavy or coarse, but framed as to be the very voice of mocking laughter, the astounding similes and disparates, the rhymes which seem to chuckle and to sneer of themselves, the wonderful learning with which the abuse of learning is rebuked, the subtlety with which subtle casuistry is set at naught can never be missed.

It signifies nothing whether *Hudibras* was Sir Samuel Luke of Bedfordshire or Sir Henry Rosewell of Devonshire, still less whether Ralph's name in the flesh was Robinson or Pendle, least of all that Orsin was perhaps Mr. Gosling, or Trulla possibly Miss Spencer. Butler was probably as little indebted to mere copying for his characters as for his ideas and style. These latter are in the highest degree original. The first notion of the book, and only the first notion, Butler undoubtedly received from *Don Quixote*. His obligations to the *Satyre Ménippée* have been noticed by Voltaire, and though English writers have sometimes ignored or questioned them, are not to be doubted. The art, perhaps the most terrible of all the weapons of satire, of making characters without any great violation of probability represent themselves in the most atrocious and despicable light, was never perhaps possessed in perfection except by Pithou and his colleagues, and by Butler. Against these great merits some defects must certainly be set. As a whole, the poem is no doubt tedious, if only on account of the very blaze of wit, which at length almost wearies us by its ceaseless demands on our attention. It should, however, be remembered that it was originally issued in parts, and therefore, it may be supposed, intended to be read in parts, for there can be little doubt that the second part was written before the first was published. A more real defect, but one which Butler shares with all his contemporaries, is the tendency to delineate humours instead of characters, and to draw from outside rather than within.

Attempts have been made to trace the manner and versification of *Hudibras* to earlier writers, especially in Cleveland's satires and in the *Musarum Deliciae* of Sir John Mennis (Pepys's Minnes) and Dr. James Smith (1605-67). But if it had few ancestors it had an abundant offspring. A list of 27 direct imitations of *Hudibras* in the course of a century may be found in the Aldine edition (1893). Complete translations of considerable excellence have been made into French (London, 1757 and 1819) by John Townley (1697-1782), a member of the Irish Brigade; and into German by D. W. Soltau (Riga, 1787); specimens of both may be found in R. Bell's edition. Voltaire tried his hand at a compressed version, but not with happy results.

**BIBLIOGRAPHY.**—Butler's works published during his life include, besides *Hudibras*: *To the Memory of the most renowned Du Vall: A Pindaric Ode* (1671); and a prose pamphlet against the Puritans, *Two Letters, one from J. Audland . . . to W. Prynne, the other Prynne's Answer* (1672). In 1715-17 three vols., entitled *Posthumous Works in Prose and Verse . . . with a key to Hudibras by Sir Roger l'Estrange . . .* were published with great success. Most of the contents, however are generally rejected as spurious. The poet's papers, now in the British Museum (Addit. mss. 32, 625-626), remained in the hands of his friend William Longueville, and after his death were left untouched until 1759, when Robert Thyer, keeper of the public library at Manchester, edited two volumes of verse and prose under the title of *Genuine Remains in Verse and Prose of Mr. Samuel Butler*. This collection contained *The Elephant in the Moon*, a satire on the Royal Society; a series of sketches in prose, *Characters*; and some satirical poems and prose pamphlets. Another edition, *Poetical Remains*, was issued by Thyer in 1827. In 1726 Hogarth executed some illustrations to *Hudibras*, which are among his earliest but not, perhaps, happiest productions. In 1744 Dr. Zachary Grey published an edition of *Hudibras*, with copious and learned annotations; and an additional volume of *Critical and Historical and Explanatory Notes* in 1752. Grey's has formed the basis of all subsequent editions.

Other pieces published separately and ascribed to Butler are: *A Letter from Mercurius Civicus to Mercurius Rusticus, or London's Confession but not repentance . . .* (1643), represented in vol. iv. of Somers's tracts; *Mola Asinorum, on the unreasonable and insupportable burthen now pressed . . . upon this groaning nation . . .* (1659), included in his posthumous works, which is supposed to have been

written by John Prynne, though Wood ascribes it to Butler; *The Acts and monuments of our late parliament . . .* (1659, printed 1710), of which a continuation appeared in 1659; a "character" of Charles I. (1671); *A New Ballad of King Edward and Jane Shore . . .* (1671); *A Congratulatory Poem . . . to Sir Joseph Sheldon . . .* (1675); *The Geneva Ballad, or the occasional conformist display'd* (1674); *The Secret History of the Calves head club, compleat . . .* (4th ed. 1707); *The Morning's Salutation, or a friendly Conference between a puritan preacher and a family of his flock . . .* (reprinted, Dublin, 1714). Two tracts of his appear in Somers's Tracts, vol. vii.; he contributed to *Ovid's Epistles translated by several hands* (1680); and works by him are included in *Miscellaneous works, written by . . . George Duke of Buckingham . . . also State Poems . . .* (by various hands) (1704); and in *The Grove . . .* (1721), a poetic miscellany, is a "Satyr against Marriage," not found in his works.

The life of Butler was written by an anonymous author, said by William Oldys to be Sir James Astrey, and prefixed to the edition of 1704. The writer professes to supplement and correct the notice given by Anthony a Wood in *Athenae Oxonienses*. Dr. Threadneedle Russel Nash, a Worcestershire antiquarian, supplied some additional facts in an edition of 1793. See the Aldine edition of the *Poetical Works of Samuel Butler* (1893), edited by Reginald Brimley Johnson, with complete bibliographical information. There is a good reprint of *Hudibras* (ed. by A. R. Waller, 1905) in the *Cambridge Classics*.

**BUTLER, SAMUEL** (1774-1839), English classical scholar and schoolmaster, and bishop of Lichfield, was born at Kenilworth. He had a brilliant career at Cambridge. In 1798 he became headmaster of Shrewsbury school. In 1802 he was presented to the living of Kenilworth, in 1807 to a prebendal stall in Lichfield cathedral, and in 1822 to the archdeaconry of Derby; all these appointments he held with his headmastership, but in 1836 he was promoted to the bishopric of Lichfield. It is in connection with Shrewsbury school that Butler will be chiefly remembered. During his headmastership its reputation greatly increased, and in the standard of its scholarship it stood as high as any public school in England. His edition of Aeschylus, with the text and notes of Stanley, appeared 1809-16, and was severely criticized in the *Edinburgh Review*. He also wrote a *Sketch of Modern and Ancient Geography* (1813), and brought out atlases of ancient and modern geography. His library included a fine collection of Aldine editions of Greek and Latin mss.; the Aldines were sold by auction, the mss. purchased by the British Museum.

Butler's life has been written by his grandson, Samuel Butler, author of *Erewhon* (*Life and Letters of Dr. Samuel Butler*, 1896); see also Baker's *History of St. John's College, Cambridge* (ed. J. E. B. Mayor, 1869); W. E. Heitland, *Dr. Butler of Shrewsbury School* (1897); Sandys, *Hist. Class. Schol.* (ed. 1908), vol. iii. p. 398.
